

23-Week Marathon Training Plan - Novice

By Matt Wilpers

Introduction

Is this your first Marathon? Are you able to run three miles 3-4 times a week without stopping? Can you commit to running at least three days a week? If so, this is the plan for you! Of course, if you have any health concerns, please make sure to consult your physician before starting.

Prior to starting this plan, it is helpful but not required to get in at least 3-6 weeks of consistent running, 3-4 times a week, and for at least 3-4 miles at a time. Also, I encourage you to drop by your local running store to make sure you have adequate footwear to train for a full marathon.

Two very important components of your training that are not covered in this program include sleep and nutrition. As the workouts get more demanding on your body, you will need more sleep to recover. It is important to remember that it is during the recovery from your workouts that you heal up and absorb the benefits. Nutrition before, during, and after your runs can make or break your training and race. You want to make sure you maintain a balanced diet that makes you feel good during your training and helps you recover after. You also want to figure out early in your training what nutrition you are going to need for race day. This is usually figured out with a little research and a lot of trial and error. If you have specific questions related to nutrition, we encourage you to reach out to a Registered Dietician Nutritionist like Claire Shorestein. Her email is eatforendurance@gmail.com and website is <http://www.eatforendurance.com/>.

A few other important components of your training that are highlighted in this program include strength training, stretching combined with foam rolling, and warming up. I always tell my athletes to think of their bodies like high performance race cars. You can run it hard, but if you do not properly maintain the race car, it will soon not function correctly and you will be on the sidelines. Your body is the same in that you have to perform maintenance work on it and treat it well if you want it to perform well. Warming up properly before hard workouts/races, performing strength work, stretching, and foam rolling are all the minimum of maintenance work you should be doing to keep your body performing at its best. In this training plan I have provided some guidance in each of these areas for you. I feel that what I have provided is the minimum of what you should be doing to keep your body performing well.

Below I have defined some of the terms used in the training program. Of course if anything is still unclear, please feel free to contact me via email with your questions and/or feedback at matt.wilpers@pelotoncycle.com.

Please note that the thoughts and comments provided above are those of my own.

23-Week Marathon Training Plan - Novice

By Matt Wilpers

Important Training Plan Terms

Pacing: During the program, various paces are called for. “Conversational Pace” is considered a running pace at which you could hold a conversation. “Marathon Race Pace” is the pace at which you think you could race a marathon at that specific point in your training. Please note that it is generally a good idea to keep your paces consistent for 4-6 weeks at a time (i.e. until you feel comfortable with them) before picking it up. For help determining what your paces should be during the program in order to reach your goals, please use a pacing calculator such as this one <https://runsmartproject.com/calculator/>.

Race-Specific Run: Every Sunday is your “Race-Specific Run” which many refer to as your “Long Run”. This is by far the most important run of the week. If you miss a workout during the week here and there, that is not as big of a deal as missing your Race-Specific Run. Do your best to not miss a single one of these runs.

Cross-Training: In addition to running, I encourage you to incorporate Peloton cycling classes into your training. As it is important to make sure you are recovered for the hard days, please make sure to heed the prescribed intensities of these classes. If you find that you are feeling excessively fatigued, extra cross-training should be the first thing to go. That said, if you feel an injury coming on related to running, I encourage you to back off on your running mileage and supplement your training with more cycling until you feel better.

Beyond The Ride (or BTR): Strength training both improves performance and prevents injury. Thus, it is an important part of your training. Please select BTR classes of your choice where/when prescribed. An extra emphasis should be placed on correcting known muscle imbalances as well as core, legs, and hip strength.

Dynamic Stretches: Following a warm-up run and before a hard workout or race, dynamic stretches are excellent to do next in preparation. Below are a few of my favorite dynamic stretches that you may choose to add to your routine.

30-40 sec of alternating leg standing quad stretch holding for 2 seconds

30-40 sec of alternating leg standing hamstring stretch holding for 2 seconds

30-40 sec of alternating leg forward lunges to stretch hip flexors holding for 2 seconds

Feel free to add more for especially tight areas, just search “Dynamic Stretches for Runners” on YouTube 😊

Please note that the thoughts and comments provided above are those of my own.

23-Week Marathon Training Plan - Novice

By Matt Wilpers

Running Drills: Following dynamic stretches, running drills are great neuromuscular exercises to do before a hard workout or race in order to remind your body of how to run with good form and activating the right muscles. Below are a few of my favorites:

15-20 Seconds of Butt Kicks

15-20 Seconds of High Knees

15-20 Seconds of A-Skips (Skipping with knee lift)

15-20 Seconds of B-Skips (Skipping with activation of the hamstrings and glutes to simulate foot strike)

Accelerations (AKA “Striders”): Following dynamic stretches, accelerations (or 15-20 second brief runs where you accelerate up to a fast pace (not a sprint) before decelerating back down to a stop) are excellent preparation before a hard effort. During an acceleration, focus on getting your body to move the way you want it to move during the upcoming workout or race. In other words, pay attention to your stride mechanics, your breathing, and your posture. I like to tell my runners to think about running “light, tall, and relaxed” in order to get the achieve proper biomechanics.

Static Stretch and Foam Roll: In order to maintain as well as improve mobility, static stretching and foam rolling are essential. For guidance, I encourage everyone to select the BTR Yoga and Foam Rolling classes of choice. In addition, I have provided a simple yet effective routine below. Feel free to take as much of or as little of as you like:

3 x 20 seconds straight leg cross body stretch, then away stretch w/ rope (20 sec over and 20 sec away...40 seconds total)

3 x 20 seconds straight leg hamstring stretch on back w/ rope (each leg)

3 x 20 seconds forward lunge w/ back knee drop to stretch hip flexor (each leg)

3 x 20 seconds standing or one side quad stretch (each leg)

Foam roll up and down each primary leg muscle for at least 30 seconds to 1 minute as well as anything especially sore or tight (quads, hamstrings, glutes, and calves). I suggest hitting the sides, anterior, and posterior of your legs.

Realistic Words of Wisdom: Having coached many athletes through training programs, I cannot recall a single athlete where everything went exactly to the original plan. Yet, most have been successful! Those that were not successful were usually so because they could not consistently allocate sufficient time for both their training and the necessary maintenance work to be performed...which getting adequate sleep. Below I have provided a plan to help guide you through your training. If you fall behind here and there, I urge you to not try to “make-up” for lost workouts by doubling up in a day etc. Instead, forget about the missed workout, reduce the intensity as needed, and keep going. Also, if you have to rearrange the schedule a little bit to better fit your life, of course that is fine. However, I strongly advise that you allocate enough recovery time between demanding workouts. This means avoiding putting two hard days back to back. Now that you are training smart, remember to train hard and have fun!!

Please note that the thoughts and comments provided above are those of my own.
