**RE: Our experience using the ED1000**

Dear Madam/Sir,

I have been asked to summarize our experience to date with the Medispec ED1000 in our institute.

We began using the ED1000 in Teikyo Univ. Hospital for the past 2 years, as an additional product to our other treatment modalities (injections, pumping devices and medications). So far we treated 56 patients.

Due to the excellent results obtained with the ED-1000 this treatment modality became our treatment of choice for ED and we use the ED-1000 device on most our patients nowadays.

We find the use of the ED-1000 very convenient for the following reasons: first of all the ED1000 is a small and compact unit which can be easily moved in and out of the operating room when not in use. It does not require a dedicated room and furthermore, no special room preparations were required.

Another impressive aspect of the Medispec ED1000 is the short amount of time it took our faculty and staff to feel comfortable with the technology and the machine and there was a very short learning curve to operate the system.

And the most important fact of all are the clinical results which we find very promising, it has been a while since we as doctors were able to offer a new modality of treatment to our patients and moreover, one which is non-invasive, having no side effects and give our patients new hope.

To summarize our clinical experience to date:

- The ED1000 is the first non-invasive method that has the potential to improve or even cure ED.
- Able to replace oral treatment in patients who previously responded to PDE5i
- Able to convert PDE5i non-responders to responders
- Demonstrate effect even in post-prostatectomy patients however, in this case we are in a very early stage of our study and more cases needs to be performed before we make a concrete statement.

As well, the unit is very user friendly and intuitive and extremely accessible which also helps us with it service costs and with the time it takes our technical team to service it needs.

Yours Sincerely
