This table shows that there are a sufficient number of channels through which an organization can benefit from intrapreneurship. The most important of these dimensions is the first: the emergence of a new company or branch. However, this is already a result which proves the presence of other dimensions in a company, which confirms that intrapreneurship is not only a powerful engine of innovations, but also a significant response to threats of an aggressive competition. Such factors as the management efficiency, human resource strategies, innovation encouragement tools, the competition in the market, economic, political and social environment as well as cultural characteristics, including the faire of failure, should be carefully analysed further in the paper.

**METHODOLOGY AND CONCEPTUAL MODEL**

The investigation regarding the impacts of the fair of failure on the dynamics of entrepreneurship in CEEC that entered the EU in 2004 is continued by presentation of the Global Entrepreneurship Monitor methodology. The present article supports important aspects of the research problem already tackled in the scientific literature review by the data from GEM 2011-2012.
Global Entrepreneurship Monitor survey is the largest study in the world on entrepreneurship (covering 90 researchers’ teams from different countries and conducted since 1999). The GEM data is gathered annually and is derived from two main sources: GEM Adult Population Survey (APS) and GEM National Experts Survey (NES).

Based on the Global Entrepreneurship Monitor methodology, countries are divided into three groups: 1) factors-oriented countries; 2) efficiency-driven countries 3) innovation-oriented countries. The study of entrepreneurship dynamics focuses on the transformation from one group of countries to another. GEM examines such entrepreneurship characteristics as motivation, innovation, competitiveness and growth potential. In the present article analyzed countries are classified according GEM methodology, as it is illustrated in Table 2.

*Table 2. Classification of analyzed countries according GEM methodology 2011-2012*

Source: GEM 2011-2012

Entrepreneurship is seen as a process, covering all the phases of the business cycle: from intending to start, to just starting, to running new or established enterprises and even discontinuing business. These surveys include the issue of new businesses, businesses ownership question or the motives for business terminating.

Survey Objective - the key purposes of GEM is to provide reliable data on entrepreneurship that will be useful in making meaningful comparisons, both internally and among countries with different economies over the time. GEM Adult Population Survey (APS) and GEM National Experts Survey (NES) were conducted using Global Entrepreneurship Monitor methodology. Characteristics of GEM Surveys in each analyzed country are provided in Appendix B.

On the national level these two surveys allow monitoring the dynamics of attitude on entrepreneurs and entrepreneurship as well as the level of intrapreneurship in each country. This will provide the necessary guidelines for different sectors of economy in order to achieve the growth of social and economic welfare.
APS survey was conducted using telephone interviews (CATI) method. The sample of respondents was drawn using random representative sample from adult population (18-64 years old). The standardized questionnaire developed by the GEM consortium (7 sections of questions about nascent entrepreneurs, owners, potential entrepreneurs, terminated business entrepreneurs, informal investors, intrapreneurship and innovation). The maximum possible statistical error ± 2.2%.

GEM NES focuses on the experts’ opinion of financial support, governmental policies and programs, education and training, R&D transfer, commercial and professional infrastructure, market openness, access to physical infrastructure, culture and social norms, capacity for entrepreneurship, economic climate, work force features, political, institutional and social context. The NES sample comprises a minimum of 36 respondents, with four experts drawn from each of the entrepreneurial framework condition categories. Out of this sample, a minimum of 25% must be entrepreneurs or business owners, and 50% must be professionals. Additional aspects such as geographical distribution, gender, the public versus private sector, and level of experience are also taken into account in selecting the sample random representative sample. Each selected expert was approved by the global GEM team. The interviews were conducting using personal face to face interviews or using web interviews (CAWI) methods. A standardized questionnaire developed by the GEM consortium was used during the interviews.

In order to obtain more exhaustive information the combination of data from both surveys (APS and NES) is used. This method of analysis enables to get insights from population point of view about entrepreneurship as well as to get expert attitude toward specific situation in particular country. Statistical data analysis was conducted using IBM SPSS Statistics software. In assessing the results, it is necessary to pay attention to the statistical error. It is due to the fact that the respondents are selected, rather than performing a continuous survey. This error is calculated mathematically (calculations are attached in Appendix C).

The raw data was sent directly to the GEM data team for inspection and uniform statistical calculations before being made available to the participating economies. All statistical calculation is done using SPSS program.

The conceptual model of present article is created by modifying GEM model to address the problematic of the present research. Figure 1 shows, how the GEM data is analyzed in the present research by illustrating some details of the processes individuals may go through entrepreneurial behavior. The level of fear as well as perceived business opportunities and capabilities will influence the option individuals may choose: to develop entrepreneurial activities on their own or within the organizations. In addition to the above phases, phases of entrepreneurial activity are identified.
Discontinuation of activities in owning and managing business is also important aspects of entrepreneurship.

![Conceptual model](image)

**Figure 1. Conceptual model**

Source: own elaboration based on GEM data

The conceptual model incorporates the three main components that capture the multi-dimensional nature of entrepreneurship: entrepreneurial attitudes and perception, entrepreneurial intentions and activities, entrepreneurial employee activity. They are included in the model as components that produce innovation, economic growth and job creation, without details how they affect and reinforce each other. This uncertainty is intended, since it is reflected the view that all elements may affect each other rather than being components of a direct process. For example, in many countries, much employment creation comes from a small number of ambitious, fast-growing new businesses (Autio, 2007). Furthermore, potentially ambitious entrepreneurs react differently to different regulatory and legal regimes than those who are less ambitious (Levie and Autio, 2011). Moreover, the conceptual model illustrates the entrepreneurial employees’ activity as well as their role as potential future independent entrepreneurs.

**DISCUSSION**

Driven by the intention to test the conceptual model presented in the previous chapter of the present publication, the attitude and perception factors related to the fair of failure are examined while linking such aspects as the perceived opportunities, perceived capabilities, the fair of failure as well as entrepreneurial intentions. It could be assumed that the fair of failure has a remarkable effect on the perception of opportunities and capabilities. A stronger fair of failure leads to a lower number of perceived opportunities and/or perceived capabilities and as a result affects entrepreneurial intentions. It is interesting to check the dynamics of these factors in the analyzed countries, as they all had a relatively similar political, economic and social experience before entering the EU in 2004. The
trend from the year 2011 to 2012 is as well of significant importance. Poland, Latvia and Lithuania, the
countries in geographical proximity, had similar percentages of people who have the fair to start
business: in 2011 it varies from 40% in Lithuania to 43% in Poland and 41% in Latvia. In 2012 the Baltic
states Latvia and Lithuania experienced the decrease in the fair of failure (by 4% in Lithuania and
Latvia); however, the situation in Poland had not changed. (As it was expected by many economists,
Estonia, which joined the Global Entrepreneurship Monitor in 2012, had relatively lower rates of fair
of failure (34%)).

Figure 2. Entrepreneurial attitudes, perception and intentions (% of population aged 18-64)

Source: GEM data 2011-2012

The improved indicators of fair of failure were followed by the improvement in percentages of people
who identify the perceived opportunities and perceived capabilities: in 2011 the perceived
opportunities in Lithuania and Latvia read 23% and 24% respectively, while the perceived capabilities
stand at the marks of 35% and 47% respectively. In 2012 the perceived opportunities in Lithuania
increase to the mark of 30% while the perceived capabilities reach 40%. The changes in Latvia are
mixed: in 2012 the rate of perceived opportunities improves and reaches 33%, while the rate of
perceived capabilities is downgraded to the figure of 44% respectively. Although the percentage of
perceived capabilities in Estonia is in line with its Baltic peers, the indicator of perceived opportunities
in Estonia is the highest among all the analyzed countries (45%). Poland did not experience the
improvement in the indicator of fair of failure from 2011 to 2012; however, its perceived capabilities
increase by 2% (to 54%) in 2012, while the number of people capable to identify the perceived
opportunities is going sharply down (from 33% to 20%). A minor improvement of entrepreneurial
intentions in Lithuania and Latvia (by 1% and 3% respectively) could be associated with the decrease
in the percentage of people with the fair of failure and the improvement of their perceived
opportunities.

As for Poland, remarkable negative changes in the perceived opportunities are not accompanied by
such a sharp drop in entrepreneurial intentions; however, such dynamics is more in line with the
change in the dynamics of the fair of failure. Although the Polish situation calls for the necessity to ingeniously examine results of the year 2013, as there are too radical changes in the analyzed indicators, the 3 countries (Lithuania, Latvia and Poland) have the dynamic of entrepreneurial intentions not contradicting to the changes in the fair of failure. Although the data for Estonia is not available for the 2011, the similarities between these Baltic States are apparent.

The situation in other selected countries is not so clear. Perceived opportunities in 2011 in Slovakia and Slovenia are similar to the levels of Poland (53% in Slovakia and 51% in Slovenia), although there are some remarkable differences with respect to the perceived opportunities (23% in Slovakia and 18% in Slovenia). The perceived opportunities reach quite similar figures in 2012 (50% in Slovakia and 51% in Slovenia), while in terms of the perceived opportunities countries experience some changes (Slovakia experience the decrease by 5%, and Slovenia shows the increase of 2%). An interesting dynamics is witnessed regarding the relation between the fair of failure and entrepreneurial intentions. During the period of 2011-2012 Slovenia is capable to catch up Slovakia in terms of entrepreneurial intentions (this figure improves from 9% to 13%) mainly due to a sharp decrease in the fair of failure (from 31% to 27%). Slovakia increases the opposite trend, the fair of failure increases from 32% to 38%, while the entrepreneurial intentions fall down to 12%, compared to 18% in 2011.

The fair of failure in Hungary and Czech Republic in 2011 reads 35%, while the perceived opportunities are also very similar read (40% and 39% respectively). The perceived opportunities in Czech Republic is more similar to the situation in Slovakia in 2011(reads respectively 24%), the rate of perceived opportunities in Hungary is the lowest among the analyzed countries in 2011 and 2012 (decreases from 14% to 11%). As it could be expected this leads to the decreasing number of entrepreneurial intentions from 20% to 13%. To conclude, it is obvious that the situation in the analyzed region differs from country to country. Baltic States are more similar to each other, Slovenia and Slovakia already belong to the innovation-driven countries, thus, experience similar dynamics of the fair of failure and entrepreneurship intentions, Czech Republic is more similar to Hungary, but unfortunately the data for 2012 is not available, Hungary is quite specific in its low numbers of perceived opportunities. In all these cases the changes of the fair of failure are accompanied by the dynamics of entrepreneurship intentions, although countries are quite different within the region.
To continue it is interesting or examine the role of fair of failure on the dynamics of entrepreneurship per phase of entrepreneurial activity. The decreasing rates of fair of failure in Lithuania and Latvia do not correspond to higher numbers of Early Stage Entrepreneurs, as in Latvia this figure increases from 12% to 13%, while in Lithuania it drops from 11% to 7%. Both countries experience the increase in the figure of established business ownership (both reaches 8% in 2012), while the decrease of discontinued businesses is witnessed only in Lithuania (from 3% to 2%). The decreasing figure of perceived opportunities and a static figure of the fair of failure in Poland lead to constant rates of early stage entrepreneurship and discontinued business as well as a slight improvement in terms of the percentage of established businesses. Estonia doubles Lithuania regarding early stage entrepreneurship activity and exceeds the figure of Latvia by 1%; however it has a weaker situation regarding the percentage of established businesses (1% less than in Latvia and Lithuania, in 2012) and a higher number of discontinued businesses (reads 4% in 2012).

The rapidly decreasing fair of failure in Slovenia, innovation-driven country, is helping to catch up another innovation-driven country Slovakia in all the stages of entrepreneurial activity (the situation remains idem only in terms of discontinued businesses. The situation in Czech Republic in 2011 in terms entrepreneurship development per stage of phases of activities incorporates patterns of various countries of the analysed cluster. There could be similarities with Poland, Baltic countries and Hungary found. While witnessing the decrease in the perceived opportunities (from 14% to 11%) Hungary improves its position both in early stage entrepreneurship activity and established business ownership (by 3% and 6% respectively).
Figure 4. Entrepreneurial employee activity (% of population aged 18-64)

Source: GEM data 2011-2012

Figure 5. Innovative orientation (% of early-stage entrepreneurs)

Source: GEM data 2011-2012

Taking into consideration that the data for the innovation orientation of early stage entrepreneurs as well as the entrepreneurial employee activity were collected only for the year 2011 it is still helpful to illustrate the proximity of the analyzed countries. In 2011, Latvia, Poland, Czech Republic and Slovenia had from 31% to 35% early stage entrepreneurs with the innovation orientation, while Lithuania, Hungary and Slovakia possessed from 20% to 25% of entrepreneurs with the innovation orientation.
The regional convergence is also witnessed in terms of entrepreneurial employee activities. In 2011 Slovakia, Czech Republic, Hungary, Poland and Latvia have relatively similar percentages of employees involved in entrepreneurial employee activity during the past three years (from 5% to 7.8%), while Lithuania and Slovenia were in lead (8.1% and 9.3%, respectively). These countries were also leading in terms of percentages of currently employed in entrepreneurial employee activity out of all employees (5.6% and 7.4% respectively). Other analyzed countries shown results from 3.6% to 5.2%. These numbers prove that the 8 analyzed CEEC countries are quite close in their innovation and intrapreneurial orientation. Although GEM indicators used for 2011 and 2012 for job expectations are slightly different they still show the differences among countries. In 2011 Slovakia (6.1%) takes lead in medium or high job expectations, followed by Lithuania (5.6%) and Latvia (5.4%). In 2012 Estonia joins the leading group of countries, while Latvia becomes a leader in terms of percentages of entrepreneurs who expect to employ 20 or more employees (3.1%).

Having the GEM data on the analyzed CEEC countries compared and the conceptual model tested there should be 3 important conclusions stated:

- Although these countries are very similar in their entrepreneurial dynamics, there are some peers’ subgroups seen in this cluster. Baltics States are more converged, although Estonia emerges as a group leader, Slovenia and Slovakia behave like innovation-driven countries and are quite different from other countries, the largest country Poland experiences quite specific development of entrepreneurship, while Hungary and Czech Republic are exceptional, according to many criteria, as it’s illustrated in Table 3.
It is obvious that countries are similar in terms of intrapreneurship and innovation orientation; however, the fear of failure is more complex and culture-related factor in order to be converging only because of a common economic, social, political and business context of CEEC.

Apart from such a contradicting argumentation, the role of fear of failure is clearly witnessed in the majority of analyzed countries, which matches the purpose of our article.

Example: Suppose that 2,000 respondents answered the question about business owner. Let’s say that 79% of them said that do not have any business. This means that with 95% probability it can be said that the real value is in the range of 79% ± 2.5%.
INFLUENCE OF SOCIAL MEDIA ON THE IMAGE FORMATION OF A TOURIST DESTINATION: DIFFERENCES BETWEEN VISITORS AND NON-VISITORS

ABSTRACT
A destination image is perceived differently depending on whether you have previously visited the destination or not. Previous experience influences the image perceived. Non-visitors base their perception on information sources consulted. Recently, information from social media whose content is user-generated (UGC) has become a new information source. The aim of this study is to analyze the weight that different web platforms have as information sources and their influence on motivations for visiting a tourist destination and the perceived image; and contrast it between visitors and non-visitors. The results are useful to define which communication channels are better to invest in and what motivations are better to highlight in the communication strategies, depending on whether the Destination Marketing Organizations (DMOs) prefer to promote the loyalty of visitors or getting new ones. To carry out this research we got 541 surveys from Mallorca, both visitors and non-visitors. We have analyzed the information sources, motivations; cognitive, affective and unique image, general image, the intention to visit and to recommend.

Keywords: destination image, image perception, user generated content, web platforms, social media

INTRODUCTION
Destination image is composed of cognitive and affective attributes (Beerli and Martin, 2004) and unique attributes (Qu, Kim and Im, 2011). Cognitive image is composed of the characteristics of the place. Affective image is generated by feelings. Unique image is formed by features that make the place different. Information sources and personal factors influence on the formation of cognitive and affective image (Beerli and Martin, 2004). Cognitive, affective and unique images exert an influence on the perception of the general image, at the same time it has an effect on the intention to visit and recommend (Qu et al., 2011). We can differentiate between secondary and primary images. The secondary image is formed only by information sources consulted before
visiting the destination (Phelps, 1986). The primary image is formed when the destination is visited. How to choose a destination involves some risk, sources of information play an important and essential role in the perception of destinations to be considered in the decision-making process (Mansfeld, 1992). Information sources can be organic, formed by friends and acquaintances; induced, belonging to the authorities of the destination, suppliers or intermediaries and ads; or autonomous, formed by media, documentaries and movies (Gartner, 1993). Recently there has been research on the Internet as a source of tourist information (Seabra, Abrantes and Lages 2007, Eurostat, 2012) or specific services such as search engines (Buhalis, 2003), social networks (Buhalis and Law, 2008), tour operators websites (Zins, 2009), online reviews (Papathanassis and Knolle, 2011), social media (Mackay and Vogt, 2012). Internet sources can be classified as organic, induced and autonomous (Llodra-Riera, 2013), unlike Beerli and Martin (2004) who considered it only as induced.

Destination image is different depending on whether the individual has visited the place or not (Hsu, Wolfe and Kang, 2004). According to Selby and Morgan (1996), understanding the different perceptions from visitors and non-visitors allows us to see the most important attributes and to re-evaluate the images to be incorporated in the planning of tourism marketing. The level of tourist experience has a positive relationship with the cognitive image among tourists who visit for the first time, and with the affective image between repeaters (Beerli and Martin, 2004).

LITERATURE REVIEW

Formation of the image of a tourist destination

There is no universally accepted scale to analyze the image of a destination (Beerli and Martin, 2004; Gomez, Garcia and Molina, 2013). Echtner and Ritchie (2003) suggest an ordering of the attributes of a tourist destination, on a scale ranging from psychological to functional. Other classifications suggest dividing the attributes into cognitive and affective (e.g., Qu et al., 2011). Cognitive evaluations imply beliefs or knowledge about the attributes of a destination; an affective evaluation stems from feelings about the destination. In combination, they determine perceptions of an overall image of the destination (Baloglu and McCleary, 1999). Noting the findings of Echtner and Ritchie (2003), Beerli and Martin (2004), Hosany, Ekinci, and Uysal (2007), and Qu et al. (2011) each constructed new models for analyzing the image of destinations. Beerli and Martin (2004) analyze associations using attributes proposed by previous authors and relationships among different components of the perceived image and factors that influence it, including information sources (primary and secondary), motivations, accumulated tourist experiences, and socio-demographic characteristics. According to Qu et al. (2011), cognitive, affective, and unique images of the destination influence the possibilities of repeat visits and intentions to recommend it.

In this research different web platforms complement the indicators that traditionally constituted information sources, as a latent variable. Accordingly, in our effort to analyze the image of tourist destinations, we review
three models: Beerli and Martin’s (2004) global view of the image, with its focus on the cognitive and functional dimensions; Hosany et al.’s (2007) in-depth consideration of the affective and psychological dimensions; and Qu et al.’s (2011) study of the unique dimension. In this connection the main objectives of the research are: (1) to define a global model of the formation of the image of a tourist destination and (2) to analyze whether there are differences in the perception of the destination image between the segments of population of individuals who have visited the destination and those who have not visited it.

Hypothesis

Sources of information

Tourists consult varied information sources to decide and plan their trip. The information obtained by the previous experience also influences the image perceived (Beerli and Martin, 2004). Seabra et al. (2007) and Lookinside Travel (2012) provide an adequate classification of the different sources of information to consider. Furthermore, different Web platforms are used to disseminate tourism content, as we have explained in the introduction. In the literature consulted on the formation of a destination image there is no reference about the relation between information sources and motivations. However, if we reviewed the scientific corpus of persuasive communication, it was seen that persuasive messages, depending on the channels that were transmitted and the target audience that they had focussed, were used to try to change behavior (Stiff and Mongeau, 2003) and therefore had an impact on motivation (Wood, 1982). From the above, hypothesis 1 has been proposed regarding the influence of information sources on the formation of cognitive, affective and unique images, and the influence of information sources on the motivations for travel to a destination.

Hypothesis H1A. Information sources influence the formation of cognitive image.
Hypothesis H1B. Information sources influence the formation of affective image.
Hypothesis H1C. Information sources influence the formation of unique image.
Hypothesis H1D. Information sources influence motivations.

Motivations

During the last three decades there have been reports on how the sociodemographic characteristics and the motivations that lead to travel influence both the process of image formation, as well as that of the selection of the destination (Mayo and Jarvis, 1981; Gartner, 1993; Baloglu and McCleary, 1999; Beerli and Martin, 2004). Beerli and Martin (2004) evaluated the relationship between the perceived image and motivations of tourists, their accumulated experience of holiday travel and socio-demographic characteristics. The results indicate that: (1) motivations influence the affective component of the image, (2) holiday tour experience has a significant relationship to cognitive and affective images, and (3) the socio-demographic conditions influence the cognitive and affective evaluation of the image. Different indicators are used in the literature to assess the construct "motivation". This research draws on the motivations used in the residential tourism survey conducted by UIB (University of the Balearic Islands) the results of which were published by Campo-Martínez, Garau-Vadell and
Martínez-Ruiz (2010). In addition, we added the general motivation that is taken into account in the PITIB 2012 (relax, discover, enjoy, learn, know), and those defined by Lookinside Travel (2012). Based on the above, we propose the hypothesis 2: motivations influence the formation of cognitive, affective and unique images as follows:

Hypothesis H2A. Motivations influence the formation of cognitive image.
Hypothesis H2B. Motivations influence the formation of affective image.
Hypothesis H2C. Motivations influence the formation of the unique image.

Cognitive, affective, unique and overall images
Regarding cognitive image, previous studies (e.g., Beerli and Martin, 2004; Qu et al, 2011) do not show a consensus on the attributes used to measure it; each of them used a different terminology to describe similar concepts. However, some researchers like Qu et al. (2011) agree on quality perceived as a part of the formation of the cognitive image. In relation to affective image, this image seems to have a consensus on the use of the affective attributes relating to personality and image, and to use the same measurement scales considered in different works (Hosanye et al., 2007; Murphy, Moscardo and Benckendorff, 2007). For this research, the affective attributes were selected based on the proposed model by Hosany et al. (2007). Finally, with respect to unique image, for this research, the attributes used corresponded to those proposed in the PITIB (2012). We have also added other attributes, used in tourist promotions conducted on Mallorca, and some of the most commonly used terms in searches about Mallorca made with search engines, such as rural farms to stay (to be checked with Google Global Market Finder from December 2012 - January 2013). We also consider rural farms, visits to vineyards and wineries and oil mills, promoted by the Balearics Government. There is a large consensus regarding the cognitive image that has a strong influence on the affective image (Beerli and Martin, 2004; Qu et al, 2011). Baloglu and McCleary (1999) show that evaluations of cognitive and affective perceptions have direct influences on the image. Qu et al., (2011) note how the unique image also contributes to the formation of the overall image. Note that in this research what is tested is whether the unique image also exerts an influence on the affective image. In response to this the following assumptions are made hypothesis 3: affective image is influenced by cognitive and unique images, and the overall image is influenced by cognitive, affective and unique images.

Hypothesis H3A. Cognitive image influences the formation of affective image.
Hypothesis H3B. Unique image influences the formation of affective image.
Hypothesis H3C. Cognitive image influences the overall perceived image.
Hypothesis H3D. Affective image influences the formation of perceived overall image.
Hypothesis H3E. Unique image influences the formation of perceived overall image.

Intention to visit and recommendation
If individuals perceive positively the overall image of the destination, it influences the intention to visit and recommend it (e.g., Campo-Martínez et al., 2010; Qu et al., 2011). In addition, it also seeks to know if the intention to visit the island influences the intention of recommending it. Based on the above we formulate the following hypothesis 4: the overall image influences the intention to visit and recommend and the intention to visit influences the intention of recommendation.

Hypothesis H4A. The overall image influences the intention to visit.
Hypothesis H4B. The overall image influences the intention of recommendation.
Hypothesis H4C. The intention to visit the destination influence tos recommendation.

Proposed model

The model proposed (Figure 1) is the summary of all the hypothesis proposed. We contrasted the model between visitors and non-visitors.

Figure 1: Model of the formation of the image of a tourist destination.

RESEARCH

Design, methodology and composition of the sample

This research relied on an online questionnaire. The sample consists of potential users of the Internet. For our empirical investigation, we used image formation of Mallorca. It is a mature tourist destination, for which the main type of tourism is sun and beach. In recent years, responsible authorities have sought to diversify the tourist offer. For measuring the relations between variables we created scales of latent variables, observing explicit indicators, following previous researchers.

The resulting sample consists of 541 valid surveys which were gathered between 19th March and 2nd May, 2013. The universe is of international and national tourists as well as residents of Mallorca and the sample unit of a population of Internet surfers over 18 years old. The level of confidence is 95% for a sample error of 4.21%. We considered the segments of people who reside in Mallorca (23.8%), in Spain outside Mallorca (34.4%) and outside Spain (41.8%). 28.7% do not know residents. 68.25% have visited Mallorca. 13.3% are between 14 and 24
years of age, 61.9% between 25 and 44 years, 20.9% between 45 and 64 years and 3.9% are over 65. 46% of those surveyed were men and 54% women. As regards gross family income, the sample is quite evenly distributed: 20.9% with less than €15,000, 27.7% from €15,001 to €30,000, 21.3% from €30,001 to €45,000, 13.9% from €45,001 to €60,000, and the rest (16.3%) more than €60,000.

**Results**

For verifying Hypotheses, first an exploratory factor analysis was performed which allowed us to identify the underlying structure, and to condense the information gathered from the information sources, motivations, cognitive affective and unique images constructs. Their dimensionality was analyzed by means of an exploratory factor analysis of the data using maximum likelihood extraction with direct oblimin rotation (Hair, Anderson and Tatham, 1999).

</table>

In accordance with the approach, a first-order confirmatory factor analysis was carried out. In order to ensure convergent validity, those items whose load factors were not significant or less than .50 were eliminated (Bagozzi and Baumgartner, 1994) or for those which the Lagrange Multiplier Test suggested significant relationships regarding a distinct factor of which they were indicators (Hatcher, 1994) (Tables 1, 2, 3, 4 and 5). The results, like the different resulting models, that the Chi-squared value is significant although when the size of the sample is large (N>200), this test tends to reject models which fit the data well; with the result that it is an unreliable indicator (James, Mulaik and Brett, 1982). Further, the rest of the specific indicators show a good fit (BBNFI; BBNNFI; CFI; IFI, AGFI and RMSEA).
For example, the confirmatory factor analysis of the scale sources of information (Table 1) shows how opinion leaders is the item with most weight (Lambda .894) followed by social networks specialized in tourism (.869), for measurement the latent variable of information sources. DMO would have to consider the spectrum of information sources, both offline and online, induced and autonomous, for promoting the destination. Besides, platforms which content is user-generated are as influential how traditional sources.

| Table 5. Table 2: Confirmatory factor analysis of the scale of motivations |
The confirmatory factor analysis of the scale of motivations (Table 2), indicates, i.e. that the price is the motivation which items that conforms this latent variable have less weight (Lamda .566 and .596). It can be interpreted that DMO would have not to base their communication strategy highlighting the price, but rather remarking motivations as discovery (.904) or enjoyment (.834).

Regarding the confirmatory factor analysis of cognitive image (Table 3), value for money of accommodation, sports, and nature are the items with more weight in the measurement of the latent variable (with a Lamda of .819, .805, and .770, respectively). These are the functional attributes more known in this case. DMO must consider if it wants emphasize the communication of these attributes or to introduce features of the destination less known.

Table 6. Table 3: Confirmatory factor analysis of the cognitive scale image
Relating to the confirmatory factor analysis of affective image (Table 4), the psychological attributes best considered, in the formation of this latent variable, are pretty, interesting, reliability and sincerity (with a Lambda of .830, .819, .807 and .807, respectively). For the DMO, keep those emotional values in its communication actions is a good strategy because of they are already recognized by users.

In relation to the confirmatory factor analysis of unique image (Table 5), the attributes that influence more, in the formation of this latent variable, are those related with the rural dimension (learning how to make olive oil and wine on location, with a Lambda of .967 and .890 respectively).

Next, we estimate the model (Figure 1), we used SmartPLS2.0 (Ringle, Wende and Will, 2005), and we established the significance of the parameters using a bootstrap re-sampling procedure with 541 sub-samples, equal to the size of the original sample. We provide the results of the structural model in Table 6. To guarantee convergent validity, we eliminated indicators whose factor loadings were not significant at least at 0.6. The resulting model indicated no reliability problems, according to any well-establish criteria: Cronbach’s alpha, (α > 0.7, Nunnally and Bernstein, 1994); compound reliability (<0.6, Bagozzi and Yi, 1988; Fornell and Larcker, 1981) and average variance extracted (<0.5, Fornell and Larcker, 1981). The most significant differences between visitors and non-visitors are (Table 6): (1) non-visitors give more weight to the webs from destinations, intermediaries and media as a source of information (FINF4). In both cases the UGC Websites are ranked fourth. (2) On the cognitive image, those who have not visited the destination give more weight to the perceived quality of basic infrastructure (IMCOG3). (3) In both segments heritage (IMUNI1) is the factor with more weight to the unique image. Whereas for non-visitors the second factor is the elite sports (IMUNI3) and for visitors the second one is rural areas (IMUNI2). (4) In the case of affective image, non-visitors point in first place sincerity (IMAFEC3), in the second accessibility (IMAFEC2) and in the third the enthusiasm and sympathy (IMAFEC4); for non-visitors the order of the factors is enthusiasm and sympathy, openness and accessibility.

Table 7. Table 4: Confirmatory factor analysis of the affective image

To assess the predictive capacity of the structural model, we followed the criteria proposed by Falk and Miller (1992): The R-square of each dependent construct must be greater than 0.1. In Table 7, we provide the corresponding values, as well as the results of the comparison of the model proposed in Some hypotheses cannot be contrasted. For non-visitors, information sources do not influence affective image (H1B), and the cognitive and unique image do not influence the overall image (H3C and H3E). For visitors, information sources do not influence cognitive and affective image (H1A and H1b), and unique image do not influence affective image (H3B). Those results indicate that DMO have to implement different communication strategies.
channels and the messages have to adapt to those who have visited the place previously or for those who have never visited it before.

Table 8. Table 5: Confirmatory factor analysis of the unique image

We can observe that relationships of the hypothesis have a different weight depending on whether the place has been visited or not (Table 7). For non-visitors, first, general image influences the intention to visit and recommendation. Third, affective image influences overall image, affective image on cognitive and motivation on cognitive image. Sixth, information sources influence on motivations and these on unique and affective images. Ninth, information sources influence the unique image and eleventh on cognitive image. And in tenth place, intention to visit influences the intention of recommendation. We could not test the influence of information sources on the affective image, and cognitive image and unique image on overall image.

Regarding destination image formation of visitors, first, cognitive image influences affective image; secondly, the overall image exert an influence on the intention to visit; third, motivations on cognitive image; fourth, affective
image on the overall image and this one on intent of recommendation. Sixth, information sources influence the motivations; seventh, intention of visiting on the intention of recommendation; eighth, motivations on unique image and then on the affective image. Tenth, cognitive image on the overall image. In the eleventh place, information sources influence the unique image and; twelfth, and in a negative form, unique image influences overall image. We could not test the influence of information sources on cognitive and affective image, and the influence of the unique image on affective image.

CONCLUSIONS

All information sources have a high weight in the process of formation of image of a tourist destination. For both, visitors and non-visitors, induced information sources have a higher weight, i.e. those belonging to the DMO, suppliers and intermediaries. For non-visitors induced website pages also have a lot of weight. Social Media are significant although it is the factor with less weight. Therefore it is advisable to spread content about the destination not only in the official sites but also through suppliers and intermediaries, including their websites, with images that it really wants to project by the DMO marketing plan. For this it is convenient to disseminate the content and images owned by DMO in a Creative Commons or Copy Left licenses. As for cognitive image it is important to project the quality of basic infrastructure to attract new visitors, as it is the dimension that takes greater weight in formation of the cognitive image. In the case of Mallorca, as for the unique image, visitors perceive a rural environment unique, this attribute can be enhanced further since non-visitors perceive heavier elite sports. It is recommended to highlight the quality of basic infrastructure and those unique attributes that visitors appreciate better for attracting new visitors and fulfilling their expectations.

### Table 9. Table 6: Instrument for measuring the structural model: Reliability and convergent validity

*** p< .01; ** p< .05; * p< .10 N/A = Not Applicable ****** These variables were measured by a single item
As for the model of image formation in both cases has a very significant weight that the overall image influences the intention to visit in first position for non-visitors and second, by those who already know the island. For non-visitors it is relevant that the overall image largely determines the intent of recommendation. We recommend to implement actions of viral marketing, inviting those who have the intention of visiting the destination to convince some companion to travel together with them. In both cases the affective image is the most influential factor in the overall image and the cognitive image on the affective image. For non-visitors cognitive image has no influence on the overall image. For visitants, information sources only have weight on the unique image. In any case information sources affect the affective image; the motivations influence affective image. Visit intention influence recommendation more on those who have already visited the destination. For maintaining the loyalty of visitants it is recommended to use direct and personalized marketing and to propose unique and new attractions in the destination to surprise them and maintain their attention, besides it would be interesting to engage them proposing they invite new visitants. Most hypotheses run better with the group of non-visitors. To attract new visitors it is recommended to maximize cognitive and unique images, using as prescribers webs from suppliers and intermediaries. It is advised too to emphasize affective attributes and motivations associated with the variables best rated by visitors, who are the ones who really know the destination. In summary, first it has to spread knowledge about the place, then emotions associated to motivations for visiting it.

For further research it would be interesting to analyze what kind of image and content are shared by a destination through intermediaries and suppliers' websites and social media and how it can modify or enrich the image projected by the DMO.

STRUCTURAL CAPITAL AND BLACK AND SCHOLES METHOD: AN APPLICATION

Lombardi, Rosa; Manfredi, Simone; Nappo, Fabio; Russo, Giuseppe
Dep.t of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT

This paper provides a study based on the assessment of structural capital through the real option approach. In this way, the Black and Scholes method is used for an economic assessment of structural capital proposing research findings deriving from an empirical application. Methodology is based on a qualitative approach. Sourcing of data has been carried out through secondary sources.

Keywords: structural capital, real options, Black and Scholes, economic value, evaluation, intellectual capital.

INTRODUCTION

The paper studies the assessment of structural capital providing an updated conceptualization of methods existing through international literature, especially regarding real options methodology (Black and Scholes, 1972; Boer, 2000; Tseng and Barz, 2002; Zeng and Zhang, 2011).

In particular, structural capital (Lerro and Schiuma, 2013; Teece, 2000) defines future cash flows and understanding its economic value with traditional methods is not easy.

Hence, the proposal is to provide a study of international methods used by academic and professional communities to evaluate structural capital, by proposing an application based on the Black and Scholes method (Black and Scholes, 1973).

In this way, the aim of research is to understand how to evaluate structural capital (Chucchi, 2013) and if the economic value obtained from the application (findings) reveals an adequate measure of the asset. Therefore, the discussion is based on strong and weak points of Black and Scholes method in the assessment of structural capital.

The research approach is based on a qualitative method. Starting from a single method approach (Myers, 2013), the research is developed according to the study of international literature.

The article has the following structure. After the introduction, section two provides a literary review of methods used to assess structural capital. In particular, the study focuses on real option methods (Black and Scholes method). Section three describes the research methodology. Section four proposes the
research findings. Section five presents discussions and implications on research. Section six illustrates the conclusions, the limitations of the study and suggests future research.

LI TERATURE REVIEW

The rule of structural capital (Itami, and Roehe, 1987) derives from the importance by all companies to create long term value (Daum, 2003). Structural capital is part of intellectual capital (Edvinsson and Malone, 1997) and it is defined as a set of all the knowledge, coded and un-coded related to the company. Moreover, it includes patents, property rights, formal and informal organizational procedures, databases, networks, best practice, Internet, corporate values and organizational culture (Stewart, 1997; Sveiby, 1997).

In knowledge economy, the economic assessment of structural business (Boer, 1999; Ferrata, 2007) is necessary to understand its value in decision making process and to complete extraordinary operations between contemporary companies (Zanda, 1974). In this way, doctrine has undertaken the following methods:

1. cost-based approach;
2. value-based approach;
3. real options approach.

The cost-based approach is based on the economic of structural capital through actual or abstractly costs incurred for his creation, historical or reproduction cost. The value-based approach defines structural capital estimating future economic benefits deriving from company assets.

The first two approaches need to be applied by knowing defined income and financial flows in assessing knowledge. For this reason, the real option approach (Amram and Kulatilaka, 1999; Banerjee, 2003; Barnea et al., 1980; Trigeorgis, 1997; Tseng and Barz, 2002; Wu and Tseng, 1986; Zhang et al., 2008) appears suitable for the assessment of structural capital (Hilli et al., 2007) and particularly risky investments, although this assessment approach has also been criticized (Black and Cox, 1976).

The real options forms (Black, 1971; Black, 1989; Buckley et al., 2002; Myers and Majad, 1983; Zeng and Zhang, 2011) are the following: development real option; deferment real option; real flexibility option; abandonment real options.

The real options assessment can be based on another two methods:

- the Cox and Rubinstein method (Cox and Rubinstein, 1985);
- the Black and Scholes method (Black and Scholes, 1973).

The Cox and Rubinstein assumption is that price option underlying evolves according to a binomial multiplicative process. An example is that underlying asset can grow with probability q of a
multiplication factor equal to \( u \), or decrease with a probability equal to \( 1 - q \) and by a factor equal to the multiplication, replacing condition as \( u > d \) (Cox et al, 1979).

The Black and Scholes method estimates structural capital starting value of real option (call and put) with the following inputs (Fontana, 2011): rate index known with the same value in the time; it is possible to sell without resource. There are not limitations to the use of income deriving from this kind of sale; there are no transaction costs; share price follows random walk; the share does not pay dividends during the life of a derivate; there are no opportunities without risk.

Fixed boundary conditions, one expression of Black and Scholes formula (closed; call model) is the following:

\[
c = S_0 \times N(d_1) - X e^{-iT} \times N(d_2)
\]

where:

\( c \) is the price of a European call real option;

and

\[
d_1 = \frac{\ln \left( \frac{S_0}{X} \right) + \left( i + \frac{\sigma^2}{2} \right) T}{\sigma \sqrt{T}}
\]

\[
d_2 = \frac{\ln \left( \frac{S_0}{X} \right) + \left( i - \frac{\sigma^2}{2} \right) T}{\sigma \sqrt{T}} = d_1 - \sigma \sqrt{T}
\]

in which:

\( c \) is the price of a (European) call (real option);

\( S_0 \) is the share price at the time 0;

\( X \) is the strike price;

\( i \) is the risk free rate;

\( T \) is the contract residual life;

\( \sigma \) is the volatility of share price;

\( e \) is the base of a natural logarithmic function;

\( N(x) \) is the cumulative function of a standardized normal.

The second expression of the Black and Scholes formula (put model) is the following:

\[
p = X e^{-iT} \times N(-d_2) - S_0 \times N(-d_1)
\]

where:

\( p \) is the price of a European put real option and other letters are specified before.
RESEARCH APPROACH

The qualitative research approach (Myers, 2013) is based on an analysis of the literature related to structural capital assessment, with special reference to the Black and Scholes method and real options approach.

Starting from a single method approach, data acquisition (Yin, 1994) was achieved through secondary research sources specified as follow:

- scientific books and articles (international literature);
- databases (particularly, ebsco and google scholar), news, documents and websites.

Application of the Black and Scholes method is used for the economic assessment of structural capital. Therefore, the proposed research findings deriving from an empirical application based on a certain number of hypotheses, utilizing the above method through excel.

THE ANALYSIS OF CASE STUDY AND THE RESEARCH HYPOTHESES

We widely accepted the idea about economic value of companies in the new economy derives mainly from intangible assets that belonging to them (a right, called intellectual property). Trademarks, patents, and licenses are strategic assets to, generate cash flows independently with respect to the business complex.

Despite the traditional methodology of discounting cash flows is well suited to their assessment, but in recent years certain intangible assets are come up, and raised a few questions about their accuracy of estimation. Particularly, we are referring that type of intangible assets to generate cash potential flow, since for this reason it becomes difficult to assess according to the DCF method.

In fact, the use of real options drives from the inability of traditional capital budgeting tools to measure flexibility and discretion of management inherent in some investment projects.

The idea underlying in the approach questions is it allows you to tie the net present value of the investment in two components: The first one represents by the static nature of the NPV (Net Present Value), and the second one is in dynamic nature represents options in the project.

In order to clarify the steps which led to a reasonable estimation value of an option, analyzes the case of evaluation of a license to a drug with opportunities for deferment of production, throughout the following research hypotheses.

In this sense it is reasonable to assume that a company uses the license in the case where the cash flows arising from the sale of the products exceed the costs incurred to make it happen.

The assessment methodology follows the chosen approach of ongoing Black & Scholes model. Particularly, the present value of cash flows (S – cash flow), resulting from the introduction of the drug today is 34,165,30 (millions) euros determined by discounting for a reasonable rate of return on capital.
"i" (risk free rate), of average flows prospective conceivable conservatively through an assessment of the potential market of reference of the product.

The initial cost (K – investment) of the drug is in fact equivalent to 25,491,34 (millions) Euro, the license is also legally protected for 15 years. The risk free rate was determined based in the gross yield on government bonds (BTP 15 years of 13.01.2014 ) and equal to 2.50 % .

And the standard deviation (σ std deviation), of listed companies operating in the biotechnology sector (Source: Damodaran "Jan"- 2014 ) appears to be a equal to 1.3364 .Consider that the product would have some impact on the market, particularly in the innovative way, it is easy to imagine the generation of extra profits by latter.

At the same time, however, the extra- profits will be linked to the period of legal protection of the license and then any delay (y - expected cost) in associating (linking to period) use of the same cost, the company bare on extra- profits.

**RESEARCH FINDINGS AND DISCUSSION**

The inputs have outlined lead through the application of the Black & Scholes method with the following estimates for "d" and "N (d)" (table 1 and 2; figure 1).

The Future of Entrepreneurship

Based on the hypothesis mentioned in the last paragraph, a fixed cash flow during the next 15 years and a fixed investment for the same years, it can be concluded that the next eleven years the project is worth more than the license. Therefore, delay in the start of production, nevertheless face losing the extra profits, which may result in an increase of present value for the project compared to what you could get from an immediate start.

The license value logically decreases from during the years, but it is interesting to observe that the option value become negative in the last years.

In this case considered a fixed cash flow and investment we will have a fixed VAN (Net Present Value), in relation to the hypothesis mentioned in the example.

The option for deferment just analyzed was evaluated as a call written on the cash flows generated by the project and with price equal to the same investment required for the implementation.

In this sense, the management may choose to exercise the option made by the project where the constitutive conditions sufficiently favorable. Or not to exercise the option and in this case to transfer the license to a third party.
CONCLUSION

In recent years, the method of cash flows has been strongly criticized by those who believe in the approach through real options. The traditional methods of capital budgeting are poorly adapted to the flexibility of certain projects and the dynamism of the markets characterizing the same.

On the base of literature review, introducing of Real Option Approach (ROA), gone beyond the limits of the Net Present Value (NPV) through the estimation of the various options inherent in a project.

In fact, the NPV assumes a symmetrical distribution of probabilities and a perfect coincidence with the modal value, explained by the lack of managerial flexibility. The real options introduce asymmetries in the probability distribution of the NPV particularly give the management some flexibility in decision-making that results in a greater chance to reap the benefits of positive future scenario.

However, that even the ROA, even today it is the most widely used method for estimating the present case at the high risk potential, begins with the subjective criticisms about litterateurs and new assessment personally goes on with me, by doing this, the reliability of the results to which the latter proofs has been completed.

The assessment and analysis made is not a new experiment, particularly the link operated between chaos theory and performance of the market, which would explain the occurrence of financial crises questioning the harmonious development of the market in the face of reality disharmonious similar to fractals (factors).

In light of the considerations made, it is appropriate to point out that this research is the basis for further studies that will address current trends in the field of structural capital evaluation.

EXCITEMENT, SOPHISTICATION AND UNIQUENESS AS DRIVERS TO
CONSUMER-LUXURY CAR BRAND RELATIONSHIP

Loureiro, Sandra Maria Correia
Instituto Universitário de Lisboa, Business Research Unit

ABSTRACT

Research Aims

This research aims to contribute to go further in understanding the consumer-luxury car brand relationship. Hence, a model related to luxury car brand meanings and consumer-luxury car brand relationship is proposed and tested.

Keywords: Excitement, Sophistication, Uniqueness, Consumer-Brand Relationship, Luxury Cars Brands

THEORETICAL BACKGROUND AND HYPOTHESES FORMULATION

Product and organization associations represent the information linked to the node in the memory in the consumer’s mind (e.g., Keller, 1993; Krishnan, 1996). Several researchers have demonstrated the positive influence of favourable brand associations on attitude towards a new product of a company (e.g., Aaker and Jacobson, 2001) or a positive brand attitude towards existing products (e.g., Low and Lamb, 2000; Van Osselaer and Janiszewski, 2001). In this vein, brand attitude can be viewed as a consumer’s overall evaluation of a brand (product and organization). Favourable luxury car brand associations will lead to a positive luxury brand attitude and the following hypothesis is proposed:

H1: Luxury car brand associations positively influences attitude towards luxury car brands.

Brand personality has been defined as the set of human or quasi-human characteristics (e.g., Keller, 1998; Petromilli and Michalczyk, 1999) that are associated with a given brand. Aaker (1997) found five dimensions for brand personality: sincerity, excitement, competence, sophistication, and ruggedness. Aaker (1997) evidenced that, whereas sincerity, excitement and competence tap an innate part of human personality, sophistication and ruggedness tap what the individuals’ desire but do not necessarily have. As Aaker (1997) also mentioned, sophistication is linked to brands such as Mercedes, Monet and Revlon. Later, Geuens et al. (2009) also developed an alternative brand personality with five dimensions: responsibility, activity, aggressiveness, simplicity, emotionality. The two scales have three very similar dimensions: excitement/activity, sincerity/aggressiveness and competence/responsibility. The last two dimensions represent a more romantic and sentimental
(emotionality) feature and simplicity (ordinary, simple). Regarding Aaker’s (1997) perspective, the last two dimensions, sophistication (upper class and charming) and ruggedness (outdoorsy and tough), have been criticized for being based on user profiles instead of human personality structure (Azoulay & Kapferer, 2003; Geuens et al., 2009). The current study follows the conceptualization of Keller (1993) about brand image. Batra et al. (1993) and Davis et al. (2000) noted that brand personality can also be regarded as a component of brand image. Effectively, brand personality, the human or quasi-human characteristics can also build associations in the consumers’ minds. Thereby, the following hypotheses are formulated: H2: Luxury car brand personality positively influences luxury car brand image; H3: Luxury car brand attitude positively influences luxury car brand image.

Customer satisfaction has been studied from two perspectives: transactional and cumulative. The transactional perspective considers that consumers make a judgment of a specific service encounter or consumption situation (e.g., Oliver, 1980). In a cumulative perspective, satisfaction is a holistic evaluation of the total purchase and consumption experience with a product over time (e.g., Lewin, 2009; Nam et al., 2011). Following the last perspective, the current study satisfaction measured satisfaction as an overall evaluation of the luxury car brands. Several studies point out satisfaction has a consequence of a favourable customer image or corporate reputation (e.g., Loureiro and Miranda, 2008; Loureiro and Kastenholz, 2011). A positive brand image could contribute to mould the overall satisfaction of a luxury car brand and even increase the confidence towards a luxury car brand.

Trust, commitment and even satisfaction are considered relationship-based constructs (e.g., Garbarino and Johnson, 1999; Sirdeshmukh et al., 2002). Morgan and Hunt (1994, p. 23) define trust as the perception of “confidence in the exchange partner’s reliability and integrity”. Trust has been considered an important determinant of commitment (e.g., Kingshott and Pecotich, 2007; Loureiro et al., 2012). Therefore, the following hypotheses are presented: H4: Luxury car brand image positively influences overall satisfaction; H5: Overall satisfaction positively influences trust in luxury car brand; H6: Luxury car brand image positively influences trust in luxury car brand; H7: Trust in luxury car brand positively influences affective commitment to luxury car brand.

**METHODOLOGY**

The car brands considered in this study were firstly BMW, Audi and Mercedes-Benz, but also Lexus, Porsche, Lamborghini, Aston Martin, and Ferrari. The reason for choosing such brands is the fact that these brands are the most representative of the E (executive), F (luxury) and S (sport) car segments according to the European Union (1999). The participants, car owners of such brands, were elements of car brand communities in Portugal and the United Kingdom. We received 368 complete fulfilled questionnaires. The majority of respondents were male (97%), which corresponds to the
male/female ratio existing in these car brand communities. Most respondents were aged between 40 and 60 years old. First, the questionnaire was pre-tested by the managers and some members of the car brand communities, around ten individuals. Thereafter, the members of car online communities (car owners) were invited to participate using an online survey.

CONCLUSIONS AND IMPLICATIONS
The results clearly point out the importance of associating excitement, sophistication and even uniqueness to the luxury car brands. These associations lead to a more favourable brand image than the direct associations to the product or the organization. In fact, the car’s modern design, good performance, concern about customers and professional staff are important features which lead to a favourable attitude of consumers towards the luxury car brand, but this is not enough to create a significant positive image in customers’ mind. The findings are in accordance with Batra et al. (1993) and Davis et al. (2000), which noted the potential influence of brand personality on creating a brand image in the consumers’ minds. The role of brand personality on brand image seems to be more relevant in the context of luxury cars. Interestingly, more important than design, good performance and positive attitude towards the staff and corporate or car brand, is the encoding in memory nodes of words such as spirited, daring, imaginative, glamorous, charming, special or unique. These are key words that make the owner of the car desire and enjoy driving. The findings lead us to write some managerial implications. Luxury car manufacturers and brand managers should be aware that the magic, mystique and legend associated to the brand are really significant. Innovative design, performance, safety mechanisms, and up-to-date technology are key features, but above all luxury car brands should be able to build up in the consumers the excitement and the feeling that having and using the car is glamorous, charming and unique. Brands with tradition in the luxury market may avail themselves of the mythical images of glamor models and so may also convey to the consumers that the brand evolves without compromising tradition. New brands of luxury cars have to find an element that differentiates them and becomes them unique, through tangible associations (e.g., design, performance, new technology) and intangibles (e.g., create an idea that originates magic, excitement).

The Future of Entrepreneurship

TITLE: SOCIAL ENTERPRISE MANAGER’S CAREER PATH
PREFERENCES: FUTURE DIRECTIONS

Maher, Chi

School of Management and Social Sciences, St Mary’s University Twickenham, London

ABSTRACT

Purpose - this paper explores the career path preferences of third sector social enterprise managers in the UK. The literature suggests that understanding of managers’ career path preferences (a variety of trajectories an employee is willing to take inter/intra organisational that fulfils his/her career needs) will provide organisations with the ability to design an effective career path options that will match individual managers’ career needs with organisational needs (Petroni, 2000; Vos et al., 2007). However, there is insufficient research that has explored the career path preferences of third sector social enterprise managers. Given this gap in research, this paper seeks to identify whether we can conceptualize third sector social enterprise manager’s career path preferences as vertical, horizontal, cross-functional (Petroni, 2000; Vos et al., 2007) or a combination of these types of career paths.

Design/methodology - a mixed method research design was employed. A survey and semi-structured interviews were conducted with forty operational managers working in eight social enterprise organisations to ascertain their career path preferences. In addition, eight HR managers working in the same eight organisations were interviewed to provide insight into managerial career path management systems in small social enterprise organisations.

Originality/value - The research makes a significant contribution in the field of career paths management in small third sector social enterprise organisations; by identifying career path of operational managers’ which are not linked to monetary needs of individual’s. This is significant for small social enterprise organisations seeking to retain managers; not through the promise of high salaries and bonuses but instead through proving opportunities that will match manager’s career path needs.

Keywords: boundaryless career model, career paths, social enterprise, managers, third sector
INTRODUCTION

The DTI (2002:7) described social enterprises as:

‘…businesses with primarily social objectives whose surpluses are principally reinvested for that purpose, in the business or in the community, rather than being driven by the need to maximise profit for the shareholders or owners’.

Social enterprises are at the centre of current political and academic discourse in the UK (Alcock, 2010; Social Enterprise UK, 2011). The government believes that by the third sector adopting a social enterprise ‘business model’, will enable third sector organisations to become involved in commercial activities, either directly or through ‘trading arms’ (for example, charity shops, internet or community cafes) to support their social and environmental aims (Alcock, 2010; Scott and Teasdale, 2010). This will allow the sector’s organisations to be more sustainable and financially independent.

The UK Government’s expansion of the third sector social enterprise policy agenda opened up new funding streams that organisations benefited from such as: Future Builders, Capacity Builders Funds and Adventure Capital Fund. However, government funding to support third sector organisations to become financially independent have been mostly time-limited from the 1990s through to the current Coalition Government policy framework, which reduces public spending to the third sector (Cabinet Office, 2010; Wardle, 2013). This has affected managerial earnings. The average third sector manager earnings is 22.5 per cent lower than a public sector manager earnings and 27.8 per cent lower than a private sector manager earnings (NVCO, 2013). These factors have contributed to an increase in third sector operational managers’ turnover from 12.8 per cent in 2008 to 14.7 per cent in 2013 (NVCO, 2013). Small social enterprise organisations are seeking ways to develop appropriate and effective strategies to enable them to retain operational managers (Venter and Sung, 2011) and to develop managerial retention strategies that are not linked to pay awards (Coetzee and Schreuder, 2008; Guan et al., 2013).

Operational managers often undertake the management and day-to-day delivery of client services (Maher, 2009; Parry and Kelliher, 2011, Wardle, 2013). Therefore, the loss of a manager impacts on front-line service delivery, service management and the ability of organisations to comply with Quality Care Commission requirements, which form part of the government contractual agreement for third sector social enterprise (drug and alcohol) organisations (Parry and Kelliher, 2009; Mold, 2012).

Operational managers turnover does not only disrupt delivery of client services it can also threaten the timely implementation of newly commissioned services (Nickson et al., 2008; Knight et al., 2011).

---

1 The Care Quality Commission regulates all health and adult care services in England, including those provided by the NHS, local authorities, and the Third sector and Private sector organisations (The Care Commission, 2011). Scotland, Wales and Northern Ireland have a separate arrangement.
Furthermore, managerial turnover is considered as inimical to small social enterprise organisations; due to its direct costs, such as replacement costs involving advertising the post, administration of the recruitment process and the time spent on new employee inductions; and indirect costs, such as reduced organisational performance level, the loss of organisational knowledge and less success in the adaptation and implementation of evidence based practice for the treatment of clients (Carroll and Rounsaville, 2007; Kim and Lee, 2007; Eby et al., 2011).

Researchers regard turnover that results from individual-level factors (such as, moving house, early retirement) are beyond the organisation’s control and can occur in any organisation or sector (Knudsen et al., 2011). Therefore, this research focuses on exploring organisational factors that can be developed by small social enterprise organisations to enable them to reduce managerial turnover. There is evidence (Garavan et al., 2006; Wong, 2007; Rasdi et al., 2009) on ways organisations have reduced managerial turnover in the private and public sectors. These studies found that organisations can reduce managerial turnover by understanding and developing career paths that integrate career path needs of managers to organisational strategy.

The literature review suggests that careers and career paths in the third sector have largely been ignored by research with a few notable exceptions, such as Onyx and Maclean’s (1996) study of intrinsic and extrinsic factors influencing the careers of workers in the third sector, Harrow and Mole’s (2005) study of third sector chief executives careers and Maher’s (2009) study of factors influencing career development in the Not-For-Profit sector. However, there is insufficient research that has explored the career path preferences of third sector social enterprise managers. Given this gap in research, this study provides an original empirical research and understanding of career path preferences of social enterprise operational managers.

**OBJECTIVES**

The objectives of this research are to explore and identify the career path preferences of small third sector social enterprise operational managers in the UK.

Research questions:

- What are the career path preferences of small social enterprise operational managers?
- Is there a relationship between small social enterprise operational managers’ career needs, organisational factors and their career path preferences?
LITERATURE REVIEW

Public policy

The literature suggests that numerous public policy since the 1990’s, such as, the 1990 National Health Service and Community Care Act in April 1993 and the introduction of competitive tendering process for contracts to third sector organisation’s by the Labour Government in 1999, led to increased government regulation of the third sector and has influenced the development of managerial career paths in small third sector organisations (Nickson et al., 2008; Cunningham, 2010). The change in policy framework from grant-aid (funding awarded to third sector organisations to contribute to supporting particular social or environmental aims without specific outcome targets to be achieved); to formal contractual arrangements with specific outcomes targets (Osborne, 1997; Macmillan, 2010; Dickinson et al., 2012). Organisations are required to measure and report on every aspect of treatment outcome they achieve for clients (for instance, how many clients completed their treatment programme, enrolled in education or training) (Osborne; 1997; The Kings Fund, 2011; NVCO, 2012). Operational managers are usually assigned the role of contract management.

In recent years, government contracts are mostly awarded for one year and occasionally for three years and in some cases the funds are abruptly withdrawn if government priorities changes (Nickson et al., 2008; NVCO, 2012). This led to some third sector social enterprise organisations diversifying their funding sources to include other activities such as membership subscriptions, trading subsidiaries (community cafés and training services) and hiring of facilities (Lee, 1993; NVCO, 2011; Dickinson et al., 2012). Small social enterprise organisations that seek to raise funding from other sources have found that funding from these sources are also time limited (Cunningham, 2010; NVCO, 2012), ranging from a few months to a year (NVCO, 2012; Dickinson et al., 2012). This creates further financial uncertainties in these organisations and influences their ability to plan and develop managerial career paths (Cunningham, 2010; The Kings Fund, 2011; Parry and Kelliher, 2011). Next the discussion of boundaryless career model conceptualisation of career paths will help us to explore career paths in organisations.

The boundaryless career model

The boundaryless career model is based on the work DeFillipi and Arthur (1994) and Arthur and Rousseau (1996). They contend that due to changes taking place in the economy and labour market in the 1990s such as, organisations downsizing and de-layering that a career path based on a hierarchical, vertical progression in one organisation is not applicable in most organisations. They posited that career paths are no longer determined by the organisation. Individuals are self-directing and taking responsibility for accumulating and developing marketable skills and competencies in order to determine their career paths within and across organisations during their working life.
(DeFillippi and Arthur, 1994; Arthur and Rousseau, 1996). In this regard, the individual acquires information, knowledge and marketable skills that will make it easier for him/her to pursue a career path that is suited to their needs within any organisation (Coetzee and Roythorne-Jacobs, 2007; Dries and Verbruggen, 2012).

The boundaryless career model conceptualises career paths as follows:

i. Vertical: a vertical career path involves upward progression within one organisation or several organisations determined by the individual. The individual accumulates competencies and undertakes training to gain skills within and outside the organisation to enable him/her to pursue a vertical career path suited to their needs as and when the opportunity arises.

ii. Horizontal: a horizontal career path involves side-ways progression to a specific or a specialist job within one or several organisations as the opportunity arises to satisfy his/her career path preferences.

Cross-functional: a cross-functional career path is characterised by an individual preferring to work on short-term cross-cutting projects in an organisation or managing several inter-related projects across organisations as the opportunity arises (Petroni 2000; Vos et al., 2007).

The review of managerial career path studies reveals that managers in the private and public sectors are pursuing career paths as conceptualised by the boundaryless career model (Martin, 2005; Wong, 2007 Cappellen and Janssens, 2010). The findings of this research will be compared with previous managerial career paths studies shown in Figure 1.1.

**METHODOLOGY**

A mixed method research design was employed. Semi-structured interviews and a survey was conducted with forty operational managers working in eight (randomly selected) social enterprise organisations in three UK regions to ascertain their career path preferences in the sector. The surveys were assessed on a five-point Likert scale that allowed operational managers to indicate the importance of each of the statements from (1) being “very low importance” to (5) being “very high importance”. The reason for using the five-point Likert scale instead of a single item was due to the author operationally defining measurement of career path preferences as the average of all items relating to each career path. This method is in-line with Allen and Katz’s (1986) and Erdogmus’ (2004) approach in assessing the career path of managers and professionals in the private and public sectors.

The semi-structured interviews provided an opportunity for an in-depth understanding of the operational managers’ interview responses in relation to their reasoning for their different rankings of the career path survey. By this approach, the researcher is using the quantitative data and the explanatory power of qualitative data to provide an original contribution to knowledge and understanding of the career path preferences of operational managers.

In addition, eight HR managers working in the same eight organisations were interviewed to provide insight into managerial career management systems in small social enterprise organisations. The author employed computer-assisted qualitative data analysis software (CAQDAS) package (Bryman and Bell, 2011) Nvivo 9 to facilitate the data coding and clustering of themes.

**FINDINGS**

The survey results displayed in Table 1.1 show that operational manager’s career path preferences mean scores. A horizontal career path (4.01) has the highest mean score; a cross-functional career path (3.85) is rated second, while a vertical career path (3.13) is rated third by the operational managers.

*Horizontal career path*

Horizontal career path is the most preferred career path by the operational managers. The evidence suggest that operational managers are undertaking training to improve their skills and competencies; in order to pursue a horizontal career path within their area of specialism in their organisations. This supports Arthur and Rousseau (1996) suggestion that individuals acquire specific skills and knowledge to enable them to pursue the career paths that fulfils their career needs and values. For instance, operational manager 24 and 25 reported:

“The organisation has been pretty supportive offering training and some bursary. I’ve taken time off to do some training I can’t fault them. I have had some training on addiction work and it’s on-going. I have been building up my PDP [Personal Development Plan] yes pretty much; gaining knowledge and skills is on-going in this field. Also because my training is only in addiction, within the field I can complement different modalities. I want to specialise more in this particular area rather than move into say more general management position. My skills are needed here” (Operational manager 24: Counselling manager: Organisation F).

“The organisation has been very good very supportive this is where I want to be. I trained for years to get the Diploma [in counselling] so I want to stay developing the therapy side of things; I’m not interested in going into general management and fund-raising activities. I’ve kept up my PDP [Personal Development Plan]. I’m up to date with my counselling skills” (Operational manager 25: Counselling manager: Organisation F).

Operational manager 24 and 25 evidence clearly suggest that they want to remain as counselling specialists by developing their career paths in their area of specialism rather than into general management roles. These views were supported by organisation F: CEO/HR manager. She reported:

“All our managers are practising counsellors or therapists they are not interested in taking up full-time management posts. I have asked them and they’ve said no to general management. They are happy managing projects with some hands on client work. I have been encouraging managers to attend courses that would extend their project management skills. It always ends
up the same, they nominate to attend a course that is related to enhancing their therapeutic
skills or addiction management knowledge ... their choice” (CEO/HR manager F: Organisation F).

The findings suggest that some operational managers stay in an organisation because they prefer a
horizontal career path that offers them the opportunity to practice in their area of specialism.
Therefore, organisations should recognise that they might not be able to retain some operational
managers if they do not offer them opportunities to progress in their career path preferences.

The prevalence of horizontal career path among operational managers reinforces the findings of
Chaudhry et al.’s (2012) study of managerial career paths in two multinational companies in Pakistan.
However, there were some differences between the findings of this research and Chaudhry et al.,
(2012) findings. Chaudhry et al., (2012) found that several managers in their sample pursued
horizontal career path within one organisation due to limited vertical path promotion opportunities
available to indigenous Pakistan managers in the two large multinational companies. The main
factors influencing small third sector social enterprise operational managers to pursue a horizontal
career path is that, several of the study sample chose to pursue their career path preferences in a
specific type of small social enterprise organisation that offers specialist services to a specific type of
client group, which happens to be the services that these operational manager’s wants to specialise in.

Cross-functional career path

A Cross-functional career path is the second preferred career path by the operational managers. The
research findings suggest that the main factors influencing operational managers to prefer a cross-
functional career path; is that it enables them to improve their chances of having continuous
employment, in their respective organisations due to the short-term nature of the third sector funding
regime (Kings Fund, 2011; Scott and Teasdale, 2012).

Some operational managers that preferred cross-functional career paths; stated that they have only
worked across different projects within their organisation in the last three years; due to the
organisation’s income and funding structure. (Cunningham and James, 2007; The King’s’ Fund, 2011;
Dickinson 2012). This has led to some operational managers preferring to work in a variety of cross-
functional projects in order to widen their marketable skills base and knowledge, ready for when the
next project comes along. Some operational managers reported:

“The organisation funded some qualification courses that I have been on and other courses.
I regularly attend courses and up-date my C.V. With this sector you need to have your skills
regularly up-dated if funding is coming to an end on a project that you’re working on and
another project comes up if you can be fitted into a role there they will fit you in. So you
need to be ready to move across projects according to the funding received” (Operational manager 27: Services manager: Organisation E).

“The organisation provides opportunity for training even with all the changes taking place in this sector which affects our organisation. I have to take training on board. I have to be flexible to go where the work is, where we have funding for a project. I have grown to be strong to be positive in times of uncertainty. I have completed my NVQ [National Vocational Qualification] level three in management. I was leading one project, when we lost funding for that project I had to take on another project. I’m now managing the carer’s advocacy project and the home visiting project. You’ve to adapt. You’re learning all the time. It’s also rewarding working here”(Operational manager 28: Advocacy services manager: Organisation E)

Operational manager 27 and 28 stated that they always seek continuous skills development and training opportunities to enable them to enhance their skills and knowledge so that they can remain employed. Their views were supported by HR manager E evidence. HR manager E reported:

“Employment contracts are based on the funding we get. Most of our contracts are short term as you know. If a particular contract is ending the people working on that contract are moved to a project where we have received funding from another pot of money. So we have more sideways moves and cross-functional moves than upward moves for the reasons that I have described. Managers are move from project to project depending on what funding we have got in. However, we have had some upward moves for instance the CEO [Chief Executive Officer] was promoted from within the organisation. But an upward move does not happen that often” (HR manager: Organisation E).

HR manager E’s evidence was further supported by HR manager B, who stated that the reasons why small social enterprise organisations predominantly provides cross-functional career path is due to the size of the organisation, funding structure and partnership arrangements with other organisations that are stipulated by some government contractual agreements. He reported:

“It is difficult with a small organisation to look at where managers are going to go. There isn’t much space for upward promotion here. We look at side-ways and multi-project management moves. We are contracted under a particular framework of ‘Supporting Peoples Agenda’. If a manager has a particular skill they want to further if we can find a way to make it happen, without breaching our contractual agreements, we will completely explore it. What we cannot do is to provide a service that another organisation is contracted to provide in order to accommodate someone’s career path needs. That will be undermining the agency’s partnership arrangements with other organisations. It is not easy to find the conditions to
fulfil each individual career path needs within an organisation of this size. So managers should be ready to move across to projects where we have funding at any particular time” (HR Manager B: Organisation B).

The evidence demonstrates that short-term funding of small social enterprise organisation’s abilities to develop a variety of career path options that are suited to the desired needs of managerial staff. As a result they offer managerial staff cross-functional career paths opportunities depending on the income and funding received.

The fieldwork finding conforms to Martin (2005), McCabe and Savery (2007) study of career paths of managers in Australia they found that most managers in their samples were pursuing a cross-functional career within their industry. Martin (2005) found that managers in his sample tend to pursue a cross-functional career path when the organisation was restructuring. McCabe and Savery (2009) found that managers in the convention and exhibition industry accumulated a portfolio of technical skills which gave them access to work on cross-functional projects in the industry in order to remain employed (projects in the convention and exhibition industry are often multi-dimensional and time limited). Similarly, third sector social enterprise operational managers that prefer a cross-functional career path were engendered by the need to remain employed in the sector due to short-term nature of third sector income and funded projects.

**Vertical career path**

Vertical career path is the third and least preferred career path by the operational managers. The fieldwork evidence suggests that a vertical path is preferred by some operational managers. These operational managers achieved a vertical career path through their own initiatives (identifying their training needs and attending the identified training courses) and organisational initiatives such as internal career advancement opportunities that their employing organisations have provided. They added that most of their qualifications post GCSE and A level education was provided by their organisations. This has enabled them to progress vertically within the organisation’s managerial hierarchy. Operational managers that prefer vertical career path reported:

“I started here as a receptionist. I have gained lots of skills and qualifications through training from this organisation they [the organisation] are very supportive, they are fantastic. When I find training that I needed, I went and presented it [the training course] and they [the organisation] have funded it. When the finance manager’s position came up because the finance manager retired, the director asked me if I would be interested in applying, I said yes. I applied and got the job. The organisation is akin to promoting from within the organisation because the people here already know how things work here” (Participant 1: Finance/development manager: Organisation A).
“The organisation has been fantastic. I started here as a support worker part-time. I was promoted to a co-ordinator and now I’m a team manager. My manager is great he has given me awareness and allowed me to use my initiatives to find training I need. He gave me exposure to things that other manager’s in other organisations would not necessarily get exposed to for example, training in management skills, visiting other projects which has helped me to move to the direction I want to go. Yeah helped me to move up” (Operational manager 11: community Inclusion manager Organisation C).

It is evident that these operational manager’s ability to pursue their career path preferences was made possible by their own efforts and the organisation’s initiatives. Operational manager 1 and 11 stated that without the training and support provided by the organisation; it would not have been possible for them to pursue their career path preferences within the organisation. These views were supported by HR manager C:

“We send managers to training such as, NVQ [National Vocational Qualification] courses which are suited to their role. If a manager has the aspirations to go up [vertical] managerial route and they are prepared to put in the time and effort to achieve that, we [the organisation] would support that. We support them to get there quickly. I will say it comes down to attitude of individuals if they come willing to be successful and fit in with the ethos and culture of the organisation. They will have the support [from the organisation] to help them to develop and progress. My director came through the internal ranks of the organisation, if you show initiatives the organisation will support you to progress where you want to go” (HR manager C: organisation C).

The evidence from HR manager C suggests that some small social enterprise organisations will support operational managers to pursue a vertical career path, if the individuals are committed to progressing through a vertical career path while helping the organisation to meets its objectives. The research finding provides additional support to the findings of previous managerial career paths studies (such as, McDonald et al., 2005; Kim et al., 2009) that found that vertical career path was pursued by managers in their sample.

The fieldwork findings provide important insight into the nature of the career path preferences of small social enterprise operational managers in the UK. Although the findings suggest that the career path preferences of operational managers conform to the career path preferences of managerial staff in the private and public sectors; some contextual third sector factors (such as, short-term funding, organisational size and government contractual agreements with small social enterprises (Scott and Teasdale, 2012) were identified as factors constraining the ability of small social enterprises to provide operational managers with career paths option.
CONCLUSION

The findings provide evidence that aspects of the boundaryless career model (Arthur and Rousseau, 1996) that conceptualises career paths (as horizontal career path, cross-functional career path and vertical career path within an organisation) were found to be evident as the career path preferences of small social enterprise operational managers.

A horizontal career path within one organisation is the most preferred career by the operational managers followed by cross-functional career path within one organisation. There was little evidence to suggest that operational managers preferring horizontal and cross-functional career paths across organisations. Therefore, the boundaryless career model conceptualisation of horizontal and cross-functional career paths across organisations was not supported by the research evidence.

Operational managers that preferred vertical career paths were able to do so when a position becomes available in their respective organisations. In the case of small social enterprise, vertical career path is not based on sequential ready-made vertical career path progression. It is more relational (a vertical career path progression is made available when funding is received or when someone retires). It is not surprising that a vertical career path is the least preferred career path by several operational managers in this study. Small social enterprise organisations have limited funding and income and as such, they are unable to develop layers of management ready for managerial progression.

Overall, the findings suggest that operational manager’s career path preferences in small social enterprise organisations are influenced by the individual’s values and career needs and the organisation’s ability to provide career path options. The findings suggest that operational managers are not totally independently self-directing their career paths as suggested by the boundaryless career model (Arthur and Rousseau, 1996). This led the author to define social enterprise operational manager’s ‘career path preference’ as:

“an intersection of an individual’s led initiatives (training, networking) and opportunities provided by the organisation (training, availability of jobs) to meet the person’s desired occupational and career path trajectories” (Original: Maher, 2013).

Small social enterprise organisations need to be aware of the factors that influence operational manager’s career path preferences and the positive outcomes (such as, retention, organisational commitment, etc.) that could be achieved when there is a match between operational manager’s career motives, career path preferences and organisational needs. This research provides an insight into the contextual factors that shape and constrain operational managers’ career path preferences in the third sector. This is significant for small social enterprise managers seeking to retain managers, not through the promise of high salaries and lifelong benefits, but rather through proving opportunities that will enable operational managers to develop projects and have independence in managing these projects.
An additional contribution of the research is that it addresses an important gap in the career path literature by providing a detailed exploration of the career path preferences of the third sector operational managers. The research findings have raised important issues for policy makers and organisations to consider, the future directions of operational managers career path preferences.

WHAT WINE TOURISTS WANT? A NETNOGRAPHIC ANSWER¹

Maizza, Amedeo; Cavallo, Federica; Iaia, Lea

Department of Management, Economics, Mathematics and Statistics, University of Salento, Lecce, Italy

ABSTRACT

The work aims at examining the online communication started by wine tourists on Web, in order to i) identify topics and subjects around which wine tourists mainly discuss and to ii) profile them, through a netnographic approach.

The originality of the paper can be identified in the application of the research methods still less used in the touristic marketing studies, although through them it is possible to express interesting research hypothesis.

Managerial involvements can be found in the possibility of using the results emerged from the analysis of the user generated contents (UGCs) so as to be able to (re)direct the communicational strategies, developing, at the same time, a targeted and personalized tourist offer.

Keywords: online wine tourism communication, wine tourist netnography, Web 2.0, wine.

INTRODUCTION

Wine is a product which can become the cornerstone of online socialization, thanks to its cognitive value, from which emotional and experiential circumstances originate, linked not only to its characteristics, but also to its area of origin (Mattiacci, Ceccotti and De Martino, 2006; Costantinides and Fountain, 2008; Li and Bernhoff, 2008; Vrontis et al., 2011a, b).

Consequently, wine tourism, too (Anholt, 2007; Hall et al., 2000) could show similar features, as it is identified for a different use of the touristic product, characterized by particular needs that often determine the reasons of customization of the tourist offer; in such context, indeed, peculiar needs (related to the knowledge of the specific area, culture, traditions and life style) prevail and extend the usual wine world field strictly speaking (Mitchell et al., 2000).

For the above-mentioned reasons, the role of web communication in this particular field seems to be significant but, at the same time, complex, as it requires targeted web marketing actions (Buhalis and Wagner, 2013); for enotouristic destinations the on-going digital revolution, indeed, can represent a

¹ The current paper has to be considered as a preliminary phase of the research project called “The Apulian tourism: analysis of the competitiveness of the Apulian territories” (original title: “I turismi di Puglia: Analisi della competitività dei territori pugliesi”), commissioned by Puglia Promozione, the Destination Management Organisation (DMO) of the Apulia Region.
big opportunity because the user generated contents (so-called UGCs; Wunsch-Vincent and Vickery, 2007) are valuable information in order to develop a customized, targeted communication which can allow a better customer experience and a far more incisive interaction (Sigala, 2012; Kujala, 2003).

NETNOGRAPHY: A BRIEF REVIEW

The paper, which is part of a wider field of research, is included in the studies connected to web communication, then trying to contextualize them in the field of such a specific sector as wine tourism. In this sense, it is possible to talk about consumer-to-business or reverse marketing due to the contribution that the tourist can give to the co-creation of many attributes of product-offering or other elements of marketing mix (Neuhofer et al., 2013; Prebensen and Foss, 2011; Tapscott, 2009; Zwick et al., 2008; Prahalad and Ramaswamy, 2004), in a perspective of digital prosumerism (Ritzer and Jurgenson, 2010).

It is thus particularly significant to try and outline the different typologies of web users on the basis of the different conversations and of the mostly discussed topics by such groups of Internet users; for this purpose the netnographic analysis may be used as a support (Kozinets, 2002).

Netnography develops as a branch of ethnography and cultural anthropology, applied to the Web; such technique is based on the body of contents from online sources, in which the topic under consideration as well as the subsequent interpretation of data are discussed (Kumar et al., 2013; Wu and Pearce, 2013; Ismail, 2010; Reynolds, 2010; Quinton and Harridge-March, 2010; Xiang and Gretzel, 2010; Puri, 2007; Dalli and Corciolani, 2007). As the textual contents (in their scientific-cultural dimension of social interaction) are more and more common on the Web, in the latest years there has been a sharp increase of studies and researches – especially in the sociological field – based on netnography, defined as “ethnography adapted to the complexity of contemporary social world”, in other words as a method that can provide a privileged access to the comprehension of “life in the age of technologically mediated culture” (Kozinets, 2010).

The netnographic approach used in the present paper is based on the direct observation of the virtual community through the analysis – without a direct participation – of the conversations realized on the communities examined (De Valck et al., 2009; Cova and Pace, 2007).

OBJECTIVES AND METHODOLOGY

Considering the importance of a permanent activity of examination/monitoring the consumer-generated media, the current paper starts from the follow research hypothesis:

The topics around which enotourists’ discussions revolve can offer useful advices for the business organization, in order to profile the wine tourists, so as to formulate a personalized and effective communication strategy.
So, the research question is:
What are the main discussion topics on blogs, forums and communities? In other words, what are the most requested information by wine tourists and upon which they mainly discuss?

Based on previous study (Fait et al., 2014, Maizza et al., 2014, Scorrano et al., 2013), the following wine tourism destinations, considered of excellence by wine tourists, have been examined: Napa Valley, California, Bordeaux, France, Tuscany and Italy.

Then, a research on Google.com has been carried on (on December 2013), using the above-mentioned keywords (wine tourism, combined with each destination name): for such analysis, the results connected to the first three pages of the search tool “Discussion” have been examined. In this way, it has been possible to identify blogs, forum and communities about which wine tourists talk about the topic under consideration, discuss, exchange information and express opinions and/or decisions.

Such subjects have been re-elaborated, according to the text mining method – which allows, through the automatic extracting of information from a usually huge amount of different unstructured textual resources, to discover previously unknown information using computers (Witten, 2005) –, in order to emphasize the most recurring topics and the most sought-after topics/data by wine tourism lovers, with a double final purpose:

- pointing out the subjects around which these users mostly discuss, as well as verify if the data searched by users are (easily) available also on the business website of the related wine destination;
- comparing the results, diversifying them for wine-destinations, with the aim of realizing a netnography (defined by Kozinets as: “a new qualitative research methodology that adapts ethnographic research techniques to the study of cultures and communities emerging through computer-mediated communication” Kozinets, 2002) that allows to outline the characteristics and possible peculiarities of the different wine tourists, in relation to the mostly treated subjects.

THE NETNOGRAPHY ON WINE TOURIST CONTENTS

The Discussion search tool of Google.com has been used here. It reports as results only blogs, forums and communities on which the discussion is about the examined wine destinations (used as keywords for the research); from the results obtained, only the first three pages have been considered. From each of them the text of the title or of the given question has been taken, as well as all the comments/replies, except for those related to groups created on Google (www.groups.google.com), for which the registration to the community was necessary; in this way, it has been possible to assemble the contents of 25 online platforms for each enotouristic destination, each of which, provided, on the average, about twenty comments among wine tourism lovers. On the whole for each of the 6
destinations it has been analysed: 25 platforms, each containing at least 20 comments (in order to emphasize the overall numerosity of the analysed comments, it must be taken into consideration that the overall text analysed by the T-Lab software is equal to 1.000 pages in .doc format).

The textual content of the online discussions, identified employing the above-mentioned methodology, has been analysed through the text mining approach re-elaborating:

- 7.894 elementary contexts (cf. box),
- 19.592 forms,
- 16.291 terms (cf. box),

for a total amount of 308.675 occurrences, considering a threshold equal to 6.

The elementary contexts can be of four types: 1. **Phrases**, that is elementary contexts identified by strong punctuation (.?!), with minimum length of 1.000 characters; 2. **Fragments**, obtained through a segmentation algorithm that considers as elementary context every word sequence interrupted by a new paragraph (line break) and whose size is less than 400 characters; 3. **Paragraphs**, that is elementary contexts identified by strong punctuation (.?!) and by line break, with maximum length of 2000 characters; 4. **Short texts**, if the corpus is made up of texts with maximum size of 2000 characters (e.g. answers to open questions).

The T-Lab software, for all the lexical units of the corpus, reports two pieces of information: the first, called **form**, contains the transcription of lexical units (single words or multiword) as strings recognized by the software; the second, that is the **word**, contains the labels in which the lexical units have been grouped and classified during the phase of automatic lemmatisation.

From a first analysis, it is possible to notice that UGCs revolve mainly around the word “wine”, which records a number of occurrences equal to 3.376 (Such value of occurrence related to the term “wine” is higher to the element observed on wine destination websites; this is to be ascribed also to the greater sizes of the contents of discussions as compared to the former); after such climax, the most used keywords are those characterizing the ‘experience’ (323) of enotouristic journey, in the strict meaning of journey: “winery” (1.356), “tour” (1.203), “visit” (1.036), “taste” (815), “tourism” (489), “travel” (422), “vineyard” (371). Taking into account, instead, the evaluative aspect of the same experience, the words frequently used by enotourists turn out to be: “great” (619), “love” (308), “enjoy” (273), “beautiful” (228), “fun” (155), “wonderful” (145), “easy” (139), “amaze” (121).
In fact, although the discussions are linked by the same thread (the interest towards areas suitable for productions of high-quality wine), the macro online discussion among wine tourist can be led back to two typologies of "suggestion":

- **expert**: favouring the aspects linked to wine-cellars and vineyards to visit, to the produced wines and their characteristics, to tastings and the most important events organized on the area;
- **funny**: linked to complementary aspects of the places taken into consideration; the landscape, culture, history are emphasized as well as the gastronomic specialities, the traditions and the possible activities to be done during the holiday.

Anyway it is important to highlight that the names of wine destinations analysed recur in the text in the following order: “Italy” (684), “Napa” (521), “France” (353), “Tuscany” (336), “Bordeaux” (333) e “California” (192). These numerical values suggests two considerations:

- the first two destinations are those that can generate greater contents, thus obtaining a high number of posts;
- there are discussions and exchange of information about these main wine destinations not only when the post concerns directly or not the destination; for example, there usually recurs a reference to Italy when an opinion and/or a suggestion related to Tuscany is then extended and enriched with information regarding the whole country; moreover Italy appears in discussions concerning France, very often in order to make a comparison, that is to underline the peculiarities of each or emphasize the similarities.

This is also confirmed by a further in-depth analysis conducted through the Analysis of Correspondences (cfr. Fig. 1), allowing to agglomerate the dispersion of data in a reduced space, thus explaining the polarization of variables and terms by the axis of a Cartesian graph (the axes of the graph correspond to the factors, that is to variables created ex novo explaining the different oppositions between the poles of factors. Factorial polarity, that is the opposition on the horizontal and vertical axes of the graph, is determined by the Test Value; this index has a threshold value equal to 1,96, that is equal to the most common statistical significance (p. 0,05), and a positive or negative mark).

With the help of this instrument it has been possible to summarize the information traceable on blogs, forums and communities in a bi-dimensional space. The relations between the context units in terms of proximity-distance (similarity-difference) have been analysed, in order to identify the behaviour of the different wine tourists, in relation to the destinations under consideration.
From the interpretation of the graphic representation it is possible to classify, according to the netnographic approach, three main typologies of enotourists (the name given to the different groups comes from the interests noticed in the discussions observed):

- **sophisticated**: that is those who privilege the “fashionable” aspect of the site, who exchange views on which is the best “chateau” to visit or the best “vintage” offered by “wineries” during the tastings; with accurate precision, many suggestions concern not only the technical characteristics of local productions, but also the price ("A red Bordeaux wine needs at least 10 years to mature. A young red Bordeaux, even when it comes from a grand chateau, is just bland and full of tannins. The complex fruit and mineral aromas need time to develop"); "More recent vintages range in price from $29 a bottle for the 2002 all the way up to $83 for the 1999"). The most frequent items are at a significant semantic proximity with the contents related to Bordeaux variable;

- **wine-oriented**: formed by enotourists that on the Web mostly discuss about Napa Valley and California; the information related to these two enodestinations are linked to the wine-world itself. They often discuss about people involved in the production chain; they talk about the best wines – very often emphasized with superlative adjectives –, the wine-cellar, the vineyards to visit and the importance of learning aspects linked to the growing and production during these tours ("Always a better experience doing the small production wineries, IMO. Meeting the owners and winemakers is so special!"; "The Syrah is slap-your-mama fantastic, and I could bathe in the Zinfandel and Cabernet. Even the Chardonnay is superb. None of Chris’ wines overpower you with alcohol, yet they’re all big, robust wines, including the white. You can actually..."
taste the grapes, the soil, the rocks, the wine. You HAVE to stop in here and buy a bottle or two. He’ll take you out amongst the grapes for an agriculture lesson if you ask him to. He’s always great about educating his customers. We’re headed out there for Memorial Day week, and I can’t wait. Can you tell I’m a big fan?; << The wines were quite good, and we really got a good education in wine country agriculture and wine making.>>.

- **typical-oriented**: wine tourists talking about Italy, Tuscany and France; on the Web they analyse cultural and architectonic aspects of these places, emphasizing history and traditions, as well as “food” and typical products. Tracing back their *tours*, they suggest in a detailed way the activities to do, the monuments to visit, how to buy the tickets for the museums and how to reach the most interesting towns (*<<You’ll have a wonderful time discovering the area you stay in - shopping for local products, eating good food, drinking good wine (it is hard to eat badly in Tuscany, most “trattoria” have extensive wine lists just like the restaurants do) and most of all taking part of your nephew’s wedding in such a beautiful context as Tuscany!!>>*).

Besides the observed clusters, there are also terms located around the centroid of the bi-dimensional space examined, that have proximity relations, from the lexical point of view, with all the enotouristic destinations under consideration. From the observation of these words, that are common to all the different destinations observed, a quite positive *sentiment* emerges by enotourists: as you can see from the previous graph (cfr. Fig. 1), the *tour experience* in the wine destinations is usually identified by lexical units, such as: “good”, “favourite”, “enjoy”, “excellent”, “great”, “nice”, “beautiful”, “wonderful”, “interest”, “pretty”.

It is useful to consider, at last, the presence, even if very reduced in number (only three), of negative adjectives; it is interesting to underline that lexical unities such as “negative”, “not good”, “expensive” do not qualify the products and/or the areas closely linked to the wine destinations under consideration, but are usually linked to the purchase of extra-services (water taxi, lunch, gift): *<<From the cruise port you can choose three different means of water transport; most expensive is a private water taxi.>>*, *<<My favourite place in Italy is the island of Capri, but boy is it ever expensive! Me and my partner paid £30.00 for burger and chips each and one small beer each, and that was back in 2007!>>*.

**CONCLUSIONS**

The present paper has originated from the hypothesis of research below (and the related questions):

The topics around which the discussions of enotourists revolve can provide useful suggestion to the web marketing decisions, in order to allow the identification of wine tourists, so as to formulate a personalized an effective communication strategy.
Carrying on with the survey, it has been possible to outline the characteristics of the “new wine tourist”, well informed, who wants to choose its destination according to its interests and also to plan its free time, and becomes, at the same time, a ‘spokesperson’ of its own travel experiences in order to provide useful suggestions to the community members.

The analysis thus conducted has allowed, through the formulation of answers to the research questions, to confirm the hypothesis from where the work started and emphasize the need of a greater dynamism of the enterprises in order to preserve and/or improve its own competitive positioning; the monitoring of the online conversations, in fact, is an opportunity for wine destinations in order to identify the customers’ feedback, gaining knowledge related to their tourist experience and enrich the contents of the offered products.

The limit of the present study, mainly linked to the needs of synthesis of the present contribution, can be attributed to the netnographic approach used; it belongs to the observative kind and so, it didn’t provide any interaction with wine tourists.

It is considered interesting to further develop the netnographic analysis, favouring a participative approach, through the administration of questions addressed to enotourists, with the aim to investigate their perceptions in reference to the wine destinations observed and possibly increase the study sample. Also, it is considered interesting to compare the UGCs and the enotouristic destinations website contents (through the text mining approach) with the aim to evaluate the coherence or incongruence between the communication elements of each online content maker (wine tourist destination and tourist).

The research conducted can, in that sense, have managerial consequences in terms of definition of an integrated, tourist offer, targeted thanks to the analysis of “virtual discussion room” around the enterprise. These communicative platforms, in fact, offer significant informational opportunities useful to the planning of a personalized, valuable offer for the customer; they also allow to become acquainted with the perceptions of users, thus the brand image that is spread online thanks to the speed of diffusion that characterizes the communication and the online word of mouth.

ABSTRACT

Research Background: Wine businesses operate in an increasingly harsh and globalized competitive environment, characterized by shifting consumer behavioural trends, the rise of new players (Third World Countries, Banks and Overton, 2010) and unpredictability. They are thus obliged to strive for ‘strategic transcendence’, through holistic re-evaluation, redefinition and re redevelopment of all their functional and marketing processes.

Research Aims: This paper analyzes attributes of the wine purchasing process and assesses, from a consumer-oriented perspective, their value as determinants of marketing strategy.

Research Methodology: Extensive theoretical research was conducted into various aspects of wine consumer purchasing behaviour. Subsequently, an empirical survey was performed, and the gathered data was processed with both descriptive and multivariate statistical techniques. The empirical research evaluated the theoretically identified variables in the context of the new competitive conditions that characterize the wine sector today.

Research Value: The research identified trends which, properly interpreted, add to our understanding of consumer behaviour and offer valuable guidance for the development and implementation of corresponding strategies (primarily concerned with marketing and branding) in the wine sector.

Keywords: Wine, Consumer, Country of Origin, Marketing, Branding

INTRODUCTION

Wine producers and sellers across the globe are operating in a challenging business context which is becoming increasingly harsh for all business-end stakeholders. Much like their counterparts in so many other industries (Thrassou, 2007), wine businesses are being forced into a competitive arena characterized by: a) globalization; b) shifting consumer behavioural trends; c) fluctuating and unpredictable macro-environmental business conditions; d) evolutionary restructuring and
repositioning of all production, distribution, sales and marketing aspects of the product (Rossi et al., 2012).

A key feature of the international wine-making sector today is the coexistence of various contexts of production and consumption. The traditional dichotomy (Campbell and Guibert, 2006) of wine producers that are the expression of an area and of the vine-grower’s experience (Old World: Italy, France, Spain, Germany and the UK), and production areas oriented to the achievement of a homogeneous product, no longer associated with a precise area of origin (New World: California, Australia, Argentina, New Zealand) is currently evolving rapidly. Key new players are emerging in the context of both production and consumption.

In the light of the above, this research analyzes attributes of the wine purchasing process in an effort to determine, from a consumer-oriented perspective, their impact on the development of marketing strategies. To this end, theoretical research into various aspects of wine purchasing was conducted. Subsequently, an empirical survey was performed to identify the ‘macro-themes’ underlying the process by which the consumer’s choice of ‘wine’ product is made.

Aware of the increasing need to translate academic findings into industrial applications, the research concludes by presenting the managerial implications of the findings.

THEORETICAL CONTEXT AND DEVELOPMENT OF THE HYPOTHESIS

A consumer-oriented approach to the wine market

In the current competitive context, knowledge of cognitive and behavioural elements that facilitate the perception of the product’s value proposition – and thus characterize the purchase process (Mowen, 1995; Thrassou et al. 2012) – is becoming increasingly important in terms of generating value for the customer (Wayland, Cole, 1997). In the above context therefore, this paper adopts a consumer-oriented approach, and considers the emotional, cognitive and behavioural dimensions of the purchasing process to be fundamental (Holbrook and Hirschman 1982; Schmitt, 2003; Vrontis et al., 2011a, b).

The starting point for this research was thus a review of the business literature with a view to identifying the attributes and variables that determine the purchase of wine. A case-by-case discussion of each of the works analysed is not possible here, but in terms of the theoretical part of this research, two broad categories of variable were identified: a) attributes/benefits strictly linked to the wine itself; b) attributes/benefits arising from the association between the wine and its place of origin (Table 1).

</tbody>
</table>

In accordance with the literature (Olson and Jacoby, 1972; Steenkamp, 1989; Oude Ophius, Van Trijip, 1995; Bernués et al, 2003a, 2003b), which cites the distinction between intrinsic attributes (organoleptic properties and physical characteristics of the product) and extrinsic attributes (price, brand, reputation, image, advertising), this study considered Organoleptic Properties, Production Methods, Bouquet and Taste in reference to the former, and References, Packaging, Price, Information found in guides and on the label, Wine tasting, Educational Tours, Cellar door sales, information available on the internet, Reputation of producer, and Reputation of designation of origin in reference to the latter.

In addition, in accordance with those authors who stress the association between the wine and its place of origin (Bilkey and Nes 1982; Al-Sulaiti and Baker 1998, Tragear et al., 1998; Van Ittersum et al. 2003) and give prominence to the wine’s hedonistic and aesthetic properties, linked to the “made in” effect (Bloch, 1986; Goldsmith and d’Hauteville, 1998; Charters and Pettigrew, 2006), this paper considered the following elements: Artistic/Cultural Resources, Natural resources, Land and Wine events,
Wine routes, Land information in brochures and Destination brands that identify the specific wine (e.g. Napa Valley, Tuscany, Bordeaux).

Research hypothesis

The paper adopts the subdivision into “old” wine regions (Italy, France, Spain, Germany and the UK), “new” regions (Australia, the California (USA), Argentina, New Zealand) and “third” regions (Brazil, India, China, Russia and Romania). Based on the findings of the above-cited literature (both general and, more importantly, specific to wine-making), it is argued here that some of the theoretically identified attributes act as behavioural guidelines, influencing the consumer’s choice of wine product. Methodologically, the research was therefore designed and executed specifically to test the above hypothesis and guarantee the reliability and validity of the results.

EMPIRICAL RESEARCH METHODOLOGY

Sampling

Regarding the context of analysis and sampling, this study chose to focus on wine buyers due to their technical knowledge, creativity and ability to identify the market of reference and related trends (Kotler et al., 2012). The sample was selected from an international buyers database (Bestwineimporters) listing (a) importers from the top 10 wine-producing countries (Argentina, Australia, China, Chile, France, Germany, Italy, South Africa, Spain, the USA/California) and (b) importers to the top 10 wine consumer countries (Argentina, China, France, Italy, Germany, Romania, Russia, Spain, the UK, the USA).

Initially the sample population was composed of subjects from the following countries: France (120), Italy (113), Germany (850), the UK (542), Spain (85), the USA/California (1130), Argentina (38), Australia (106), New Zealand (53), China (47), South Africa (33), India (36), Russia, (65), Romania (39), Brazil (110).

The sample was then revised on the basis of: a) buyer website assessment (deemed methodologically necessary as contact with buyers was by Facebook, e-mail or filling in “contact us” fields in the period May-November 2013); and b) the buyers’ level of specialization, so as to include only those who trade in wine.

Since this was exploratory research conducted on a selected sample, the convenience sampling technique was applied and a total of 315 properly completed, valid questionnaires were collected, considered and analyzed (28 from the UK, 14 from France, 31 from Germany, 8 from Spain, 21 from

The Future of Entrepreneurship

Italy, 35 from the USA, 25 from Argentina, 25 from Australia, 26 from New Zealand, 20 from South Africa, 22 from Brazil, 20 from India, 20 from China, 12 from Russia, 8 from Romania).

Questionnaire development and analysis

A semi-structured questionnaire was constructed with the aim of identifying and understanding perceptions of specific determinants of purchasing behaviour, and a pilot test was conducted.

For quantitative measurements, a five-point scale was used (5 = greatest importance, 1 = least importance). A validation test was also conducted by sending the first version of the questionnaire to 20 buyers working in 4 different geographical areas.

Data were analysed using SPSS software (Statistical Package for Social Science), with the gathered data being processed by descriptive and multivariate techniques. Factor analysis was used to test the research hypothesis.

RESULTS AND FINDINGS

Attributes guiding the consumer choice process

The first step of the research allowed the identification of ‘macro-themes’ influencing the consumer’s choice of ‘wine’ product on an international scale. The research sought to verify whether this process is indiscriminately structured, or whether certain groups of variables play a greater role than others, so as to identify possible guidelines for consumer-oriented marketing strategies. To this end, and to highlight the existence of a structure underlying the set of observed variables, Factor Analysis (appropriate for the explorative nature of the research) was applied.

The results of the KMO test (0.867, i.e. > 0.7) and Bartlett’s test were indicative of a correlation between the variables (p-value > 0.05), confirming the suitability of factor analysis. The analysis extracted five elements that explain 68.025% of variance (values of 60-70% being considered acceptable in terms of the informational function)1.

The data were interpreted by means of the rotated component matrix (Table 2), in which the variables are associated with the components with which they show the highest correlation.

---

1 The five identified components all have high values and summarize the information contained in the original data matrix. This is confirmed by the scree plot and the communalities (not shown here due to lack of space).
The first component, which we call ‘Relationship between territory and wine’, is characterized by the high correlation of variables indicative of the external visibility of this relationship (Artistic and Cultural Resources, Natural resources, Land and Wine events, Wine routes, Land information in brochures, Destination brand identifying the specific wine), and the perception of this relationship as a means to increase the value of the wine product. This confirms that the consistency between the product and the image of its region of origin, frequently cited in the literature, is a key element of a wine’s value.

The second component, which we call ‘Wine identity card’ relates to the wine itself, in the sense that it includes variables arising from its intrinsic features (Organoleptic Properties, Production Method, bouquet, taste, reputation of producer, reputation of designation of origin).
Bouquet, Taste) and the ‘reputation’ variable (Reputation of producer, Reputation of the Designation of Origin).

The third component, ‘Experiential identity of wine’, corresponds to the consumer’s need to ‘explore’ the wine, by means of a flow of information that is not linked to strictly oenological factors, but rather to experiential elements. The variables included here indicate a consumers’ need to know/understand the wine’s context through direct/experiential contact (Educational Tours, Cellar door sales) or via social communication tools (information on the internet, particularly blogs and social networks).

The fourth component, termed ‘Information in support of the purchase process’, is characterized by the correlation between three variables (References, Packaging, Information in the guides and on the label), indicative of a need for information in support of the purchase process, guaranteed by the numerous references, the packaging and the information included on the label (e.g. grape variety, alcohol by volume, place of production, etc.) and in the guides (tasting scores, competitions, matching, etc.).

The last component, ‘Price’, is fundamentally linked to economic evaluation at the time of purchase.

**CONCLUSIONS AND MANAGERIAL IMPLICATIONS**

The managerial literature, particularly of an empirical nature, has analyzed the process of consumer wine purchasing with regard to one or a small number of attributes. In contrast this paper considered attributes and variables identified by the literature but suggested a multi-dimensional vision of the process. Specifically it sought to understand whether this process is indiscriminately structured or whether certain groups of variables play a greater role than others in the process.

Due to the reduced representativeness of the statistical sampling, this research cannot thoroughly outline consumer behavioural trends in the international context. However, it may be said to have a) identified trends which, properly interpreted, add to our understanding of consumer behaviour and offer valuable guidance for the development and implementation of marketing and other strategies in the wine business sector; b) analyzed the attributes of the wine purchase process with regard to new players who are taking on a significant role in the production context as well as in wine consumption.

Specifically, Factor analysis revealed that:

1) The wine product can be analyzed multi-dimensionally in the context of international consumer behaviour. The wine product is diachronically permeated by its tangible attributes, which are relatively explicit and relate to taste, bouquet, colour and all the other characteristics that contribute to the knowledgeable consumers’ conscious evaluation of the wine’s ‘tangible’ qualities. Commercial success however is also very much a matter of marketing factors, relating to parameters such as price, brand recognition, accessibility, promotion, etc.
The research however, also indicated a less tangible aspect of wine identity that consciously or subconsciously affects consumers’ perception of the product, and consequently their preferences and choices. Typically, and of special interest to this research, this aspect relates to the wine’s country-of-origin.

2) The international wine market is characterised by five ‘macro-themes’ underpinning the perception of the general ‘wine’ product: ‘Relationship between territory and wine’, ‘Wine identity card’, ‘Experiential identity of the wine’, ‘Information in support of the purchase process’, and ‘Price’. From a consumer-oriented perspective then, the previous considerations can be interpreted as guidelines which modulate a value proposition in accordance with the consumers’ attitudes. They are linked to the following marketing concepts:

- The Wine Identity card component is linked to the product experience dimension, i.e. the consumer’s interaction with the product or the brand;
- The Price and Information in support of the purchase process components correspond to the shopping and service experience dimension, concerning consumer-store interaction (whether physical or virtual) (Maizza et al., 2013);
- The Experiential identity of the wine and Relationship between territory and wine components correspond to the hedonistic-experiential dimension of the consumption experience.

In conclusion, wine is perceived as a product giving physical enjoyment, but also increasingly as a means of association with the cultural and lifestyle connotations of the wine’s place of origin. The combination of the two constitutes what we might call the ‘wine experience’. Wine producers and sellers must develop both aspects of the product, in terms of both physical production and marketing practices. Today, as a consumer choice and a commercial activity, wine is no ordinary product, and its production and branding in those new countries which are now beginning to play a significant role in both production and consumption must take account of this.

This paper represents the first step in a wider research programme that will seek to determine whether there are:

- groupings of countries showing homogeneities or shared characteristics in the choice process;
- specific features that distinguish wine products in the perception process of new international players.

INVESTIGATING THE STAGES AND THE ROLE OF THE BUYING EXPERIENCE IN THE BUYING PROCESS OF CRAFT RETAILERS IN SOUTH AFRICA

Makhitha, KM
Department of Logistics, Vaal University of Technology, South Africa

ABSTRACT
Craft retailers play a dominant role in the craft industry value chain yet craft producers face difficulties selling to this market. Instead they resort to selling directly to end consumers and not through craft retailers. An understanding of craft retailer buyer behavior is a necessity for craft producers who want to sell their products successfully through the craft retailers. The purpose of this study was to investigate the buyer behavior craft retailers exhibit when buying from the craft producers. Survey was conducted among 233 craft retailers in SA. A convenience sampling method was adopted for the study. The findings revealed that craft retailers go through homogenous buying stages. The stages in the buying process did not differ across different types of craft retailers. The stages also did not differ according to the years of buying experience of craft retailers.

Keywords: buyer behavior, buying stages, buying process, craft retailers, craft producers

INTRODUCTION
In the last 10 years there has been a growing increase in the number of craft producers and craft retailers in SA (Department of Sports, Arts, Recreation and Culture, 2007). The increase is a result of a growing demand for craft products in the world market as well as the increase in the demand for souvenir products purchased by tourists during their travels (Moreno and Littrell, 2001). The role of craft retailers has also grown in importance as craft producers look into all available and alternative channels for distributing their products (Department of Sports, Arts, Recreation and Culture, 2007).

The craft industry contributes about R2 billion to the gross domestic product (GDP) in retail sales, with craft retailers playing a dominant role in the craft industry value chain (Kaiser and Associates, 2005), making craft retail an important part of the craft industry value chain. Craft retailing takes place through over 500 craft stores and other types of stores such as galleries, museums, small interior shops, gift shops and craft markets as well as national chains such as clothing shops, interior décor shops, furniture stores, hypermarkets, discount stores and jewellery shops (Department of Trade and

The Future of Entrepreneurship

ORGANIZATIONAL BUYER BEHAVIOR MODELS

Organizational buyer behavior refers to the process organizations go through when buying products or services (Dwyer and Tanner, 2009). A number of organizational and retail buyer behavior models exist that depict the stages in the buying process that organizations go through during the buying process. The first organizational buyer behavior model is the Robinson, Faris and Wind (1967) model. This model has been the most researched and most widely applied and published (Farell, 2006; Da Silva, Davies and Naude, 2002; Homburg and Kuester, 2001; Mawson and Fearne, 1997). It is generally known as the Buy Grid model. The model consists of the two sub-models, the buy phase and the buy class models. The buy phase model shows the stages that organizations follow in the buying process. There are eight stages, including recognition of a problem, determination of the product type needed, description of the product type needed, search for and qualification of potential suppliers, requisition and analysis of proposal, evaluation of proposal and selection of suppliers, selection of order routine and performance review (Hutt and Speh, 2007).

Other models of organizational buyer behavior include those developed by Webster and Wind (1972), De Boer, Labro and Morlacchi (2001) and Luo, Wu, Rosenberg and Barnes (2009). The model of Webster and Wind depicts the stages in the buying process as well as the tasks a buyer performs and the factors influencing such tasks during the buying process. The Webster and Wind model (1972) is similar to the Robinson et al. model (1967) in that they both depict the process buyers follow when involved in the buying decision. The difference is that the Webster and Wind (1972) model has fewer stages than that of Robinson et al., (1967). The De Boer et al. (2001) model reflects four stages in the buying process. This model emphasizes the relative importance of supplier selection and evaluation during the buying process. The Luo et al., (2009) model also shows four stages followed by a buyer during the process. Weele (2005) discussed six stages retailers go through when buying, arguing that retailers go through different stages in the buying process of an organization.

The above authors investigated the stages from the perspective of manufacturing organizations, while Weele (2005) discussed the stages from the perspective of retailers.

The Sheth (1981) model is another model that depicted the buyer behavior of retailers. This model was adapted from the Sheth (1973) model and was specifically developed for adoption by retailers. The model focuses on factors affecting retail buyers and the criteria retailers use during the buying process. It depicts only three stages in the buying process, which is why other models were adopted in this study. By adopting the stages from the above models, this study will investigate the buying
process and stages followed by craft retailers when buying craft products. The stages in the buying process in each of the stated models are shown in Table 1 below.

Table 1: Stages in the buying process

As can be seen from Table 1, researchers differed in the number of stages retailers go through during the buying process. Ghingold and Wilson (1998) and Burger and Cann (1995) identified six stages in the buying process. Applying the Robinson et al. (1967) model to buying by restaurants, Mawson and Fearne (1997) found that restaurants go through an extended decision-making process, with eight buying stages. Fawzy and Samra (2008) listed nine stages in the process of buying and selection of a meeting site.

THE ROLE OF BUYING EXPERIENCE IN THE BUYING PROCESS

The buying process, especially the supplier search stage, is influenced by the experience of a buyer. Some buyers look for suppliers from within their existing supply relationships, indicating the importance of the buying experience during the buying process (Johansson and Burt, 2004). According to Webster and Wind (1996:57) the learning experience of the buyer influences the buying decision. Da silva, Davies and Naude (2000) have also indicated that the less experienced buyers exhibit different buyer behavior compared to the experienced buyers. Since buyers are evaluated on the margins they can attain (Da silva, Davies and Naude, 2000), they could spend more time and effort searching and evaluating suppliers. Crittenden, Scott and Moriarty (1987) investigated the impact of buying experience in organizational buying. The study reported that the more inexperienced the buyer, the less invoked set they have and that those that are more experienced consider a large number of selection attributes during the supplier selection and evaluation stage. Park and Krishna (2001:267) and Yu, Fairhurst and Lennon (1996:20) also found that years of buying experience affect the decision on which supplier selection criteria to use when evaluating suppliers.
Furthermore, Moriaty and Spekman (1984:144) showed that experienced buyers develop greater knowledge of products and suppliers and feel more comfortable evaluating competing products and suppliers without assistance from other people.

Buyers involved in repeat purchase situation develop a structured choice process while those involved in other situations would be involved in a different choice process (Bunn, Butaney and Hoffman, 2001; Sproule and Archer, 2000). This implies that buyers will go through different buying process depending on experience in buying a product.

Johansson and Burt, (2004:810) reported that the experience of a buyer is only important when buyers select suppliers from the existing supply relationships and not when looking for new ones.

Furthermore, Farrell (2006:96) found that buyer behavior of import buyers differed with years of buying experience. The buying experience was also found to apply mainly in the rebuy situation (Mawson & Fearne, 1997:242).

PROBLEM STATEMENT, OBJECTIVES AND HYPOTHESES

A study conducted among craft producers in Gauteng, South Africa revealed that they experience difficulties selling to craft retailers and that craft retailers purchase only 36 percent of craft products from SA (Department of Sports, Arts, Recreation and Culture, 2007). The Wesgro study (2000) also confirmed that craft producers find it difficult to access the craft retail market. As a result, some craft producers resort to selling directly to end consumers, using direct channels instead of selling through the retailers (Wesgro, 2000), this despite the growing role of craft retailers in the craft industry value chain. Craft retailers are creators of the markets, developers of new products and are also able to source new products (Hay, 2008). There is an active retail market for craft producers. However, craft producers do not have access to such markets. This is due to a lack of understanding of retail buyer behavior as well as of the selection criteria used to evaluate and select suppliers. Such an understanding would help suppliers to capitalize on the increased demand for their products (Skallerud and Gronhaug, 2010).

The purpose of the study is to investigate the buyer behavior of craft retailers in SA. The specific focus will be on the buying process followed by craft retailers when buying craft products.

The objectives of the study were as follows:

- To determine the buying stages that craft retailers go through when buying crafts.
- To ascertain if the buying stages differ across different types of craft retailers.
- To determine if the buying staged differ according to the years of buying experience of craft retailers.
To address the above objectives, two hypotheses were formulated.
From the above discussion, the following hypothesis was formulated:

\[ H_1 \] There are significant differences between types of craft retailers and the number of buying stages they go through

\[ H_2 \] There are significant differences between the years of buying experience of craft retailers and the buying stages they go through

**METHODOLOGY**

The study adopted a survey method targeted at craft retailers in South Africa. This included craft retailers of different types and sizes such as craft shops, small interior and gift stores, interior and decor shops, discounts retailers, clothing shops, furniture shops, museums, galleries, jewellery shops and destination retailers. A non-probability convenience sampling method was adopted owing to the difficulties of identifying craft retailers and the fact that there was no reliable and easily accessible database of craft retailers. According to Cooper and Schindler (2006) convenience sampling is suitable when there is time constraints and lists of available units are either incomplete and not up-to-date, as with the case of SA craft retailers.

Data were collected electronically through email as well as personally hand delivered questionnaires to craft retailers for self-completion. The total number of questionnaires sent out to craft retailers was 681. Of the 681 questionnaires, 273 were completed and returned. However, only 233 of the 273 completed questionnaires were usable, giving a response rate of 34 percent. The remaining 40 questionnaires were incomplete, with some questionnaires only half done or missing multiple responses; these were therefore disregarded and not included in the analysis.

The questionnaire was of self-completion nature and was designed using information collected from a preliminary qualitative study (interviews) which was conducted among craft retailers and industry experts as well as from the literature. Respondents were requested to indicate if they go through the 16 stages listed on the questionnaire by answering Yes or No. The questionnaire was pre-tested using the participant pre-test method with 12 craft retailers and the wording of some questions were slightly altered to ensure clarity. Furthermore craft retailers did not receive any incentives and participation was voluntarily.

Data were analyzed using SAS software. Descriptive statistics and ANOVA tests were conducted and the results are reported and discussed in the next section. ANOVA is a statistical analysis used to test the differences between two means (Sudman and Blair, 1988) and helps estimate group differences on their means among the groups. Where the estimates of scores and means do not differ, it is assumed that all the group means originate from the same sampling distribution of means. Where the group
means differ more than expected, it can be concluded that the group means were drawn from the different sampling distribution of means, and the null hypothesis that the means are the same is rejected (Tabachnick and Fidell, 2001). As ANOVA indicates differences only, the Duncan’s multiple range test, a post-hoc test which makes comparisons among groups to determine if significant differences exist (Hair, Black, Babin and Anderson, 2010), was used to identify where these differences between groups were.

**ANALYSIS AND DISCUSSION OF THE FINDINGS**

*Descriptive statistics*

The sample consisted of various types of retailers as depicted in Table 2 below. Of the 233 respondents, 94 were craft stores, representing 44 per cent of the total population. Destination retailers were the next biggest group, representing about 16 per cent (n=35) of the population, followed by the small interior/gift stores with about 12 per cent (n=27) of the population. The rest of the respondents, clothing stores, discount stores, furniture stores, galleries, museums, jewellery shops and destination retailers, had a very small representation.

n= 220 Missing responses = 13

For the purpose of statistical analysis, craft retailers were collapsed into five groups: the craft stores; small interior/gift stores; large retailers such as interior décor/homeware stores, clothing stores, discount stores and furniture stores; specialty stores such as galleries, museums and jewellery shops; and destination retailers. The five groups excluded the ‘other’ category since there were no types of retailer mentioned. Therefore, the five groups consisted of 214 responses. The representation of the
five groups were as follow: craft stores (44%), small interior/gift store (13%), large retailers such as clothing and décor stores (14%), specialty stores such as galleries, museums and jewellery shop (13%) and destination retailers (16%).

The respondents consisted of buyers, managers, owner-managers, manager-buyers and executives responsible for buying. The owner-managers were the largest group, comprising 44 per cent (n=101) of the population. Managers were the second largest group of respondents, comprising over 18 per cent (n= 42) of the population. This was followed by manager-buyers, with about 14 per cent of the population (n=31). Buyers made up over 12 per cent of the population (n=28). The last group of respondents was the executives, who represented about 12 per cent of the population, consisting of 27 respondents.

Table 3 below depicts the stages craft retailers go through. The frequencies and percentages as well as the number of respondents are shown.

</table>

From Table 3 it is evident that the majority of craft retailers, as represented by 94 percent (N=219) of the respondents, indicated that they went through the stage of a need identification, and that ‘we determine the characteristics and/or quantity of craft products needed’, as indicated by 91 percent of respondents. Craft retailers do not all follow all the listed stages, as shown by the fact that 34 percent (N=79) of the respondents indicated that they did not go through the stage of developing a contractual agreement with the supplier, or ‘create a precise description of craft products needed’, as revealed by 33 percent (N=77) of respondents. Approximately 27 percent of the population (N=62) indicated that they also did not formulate criteria to evaluate suppliers. Generally the results of the stages listed in the buying process indicate a fairly high percentage of agreement (Yes) among the respondents regarding the stages retail buyers go through.

The stage which craft retailers use most when buying crafts is ‘we identify a need for craft products’, as indicated by almost 94 percent of respondents. This stage was followed by ‘we determine the characteristics and/or quantity of the craft products needed’, as shown by over 91 percent of the sample, ‘we evaluate and/or select craft suppliers’, with just over 87 percent of the population, ‘we negotiate trading terms of suppliers’, represented by over 87 percent of the sample and ‘we search for potential suppliers’, represented also by over 87 percent of the sample.
The least used stage in the buying process of a craft retailer is ‘we develop a contractual agreement with the supplier’, agreed to by about 66 percent of the sample, followed by ‘we create a precise description of the craft products needed’, which was agreed to by about 67 percent of the sample. The third least-used stage in the buying process of the craft retailers was found to be ‘we place trial order/s and finalize the approval of suppliers’, as indicated by over 72 percent of the sample. Another important aspect worth noting in the buying process is the fact that 28 percent (N=64) of craft retailers revealed that they did not place trial orders to finalize the approval of suppliers. Some craft retailers, as indicated by 34 percent of the respondents, did not enter into contractual agreements. It is evident that the majority of craft

The fact that some craft retailers do not develop contractual agreements with craft producers also applies in other industries sourcing products from informal and small organizations, where verbal orders, agreements and price negotiations are made (Bienabe and Vermeulen, 2007). Previous studies have indicated that in some buying situations, buyers have difficulty in measuring or specifying the exact nature of the products needed and that buyers are more concerned about the quality and performance of the product (Francis and Brown, 1985-86). Another study revealed that the exact specification evolves from the samples, through appearance and product sampling (Mawson and Fearen, 1997).

Furthermore, Esbjerg and Skytte (1999) found that the majority of retailers placed trial orders before they sourced more products, which supports the findings of this study, where 72 percent of craft retailers placed trial orders before large orders were placed. According to Johansson and Burt (2004), the buying stages differ for the first stages of the buying process while the rest of the stages in the process are similar. This study found that the first two stages were undertaken by the majority of craft retailers, as shown by the 94 percent and 91 percent of craft retailers who went through these stages in comparison with the percentages of those retailers who went through the other stages such as ‘we create a precise description of the craft.

Testing the hypotheses

The first hypothesis serves to determine whether the number of buying stages differs across the five types of craft retailers. ANOVA testing was conducted to test H1 and the results are reflected in Table 4.
As can be seen in the table, the p-value of 0.1506 is larger than the specified significance level of 5 percent, thus showing no significant differences in the mean values of the number of stages of the buying process and across different types of craft retailers. Thus, there is no significant difference in the stages craft retailers go through across types of craft retailers. **H1 was therefore not supported and the null hypothesis was accepted.** According to Johansson and Burt (2004), the number of buying stages is determined by the types of products being bought and might not be the same for different types of products. However, the findings in this study suggested that different types of craft retailers do not differ regarding the number of stages they go through.

To test the second hypothesis, ANOVA testing was done to determine if there were significant differences between the numbers of stages across the years of buying experience. These results are reported in Table 5. As can be seen in the table, the p-value of 0.3351 is larger than the specified significance level of 5 percent, thus showing no significant differences in the mean values of the stages across years of buying experience. Therefore, the null hypothesis was accepted and H2 was not supported.

</table>

It can be concluded that craft retailers with different years of buying experience do not differ regarding the number of buying stages they go through when buying craft products. It seems that buying experience plays no significant role in the number of buying stages used.
CONCLUSION AND LIMITATIONS OF THE STUDY

A list of 16 stages was provided based on the literature review and interviews. The majority of craft retailers (66 percent) go through a lengthy buying process consisting of 16 stages. This is an indication that the buying process of some craft retailers involves far more stages than those suggested in the existing literature. It is also an indication that craft product buying is a complex process and that craft retailers are involved in a new buy situation. This could be due to the lack of standards in the industry and the fact that craft producers are scattered all over the country. The most used stages in the buying process are ‘we identify a need for craft products’, (94 percent), ‘we determine characteristics and/or quantity of the products needed’ (91 percent), ‘we search for potential suppliers’ (87 percent), ‘we evaluate and select suppliers’ (97 percent), and ‘we negotiate trading terms with suppliers’ (87 percent). It is therefore important for craft producers to ensure that they are aware of the needs of retailers for craft products and also to ensure that retailers are aware of them. As some small craft producers may not have the necessary skills to enter into negotiations with large retailers, this is an area where government could play an important role by providing training and legal advice.

The least used stages are ‘we develop contractual agreements with the supplier’ (68 percent), ‘we create precise description of the craft products needed’ (67 percent) and ‘we place trial order/s and finalize the approval of suppliers’ (72 percent). No significant differences were found among the different types of craft retailers and the number of stages retailers go through. It can be concluded that the majority of craft retailers exhibit homogeneous buyer behavior by going through the same number of buying stages in the buying process. This suggests that little variation exists and will ultimately make it easier for craft producers who want to make use of a standard/undifferentiated approach of selling to craft retailers. Craft retailers with different years of buying experience also exhibit similar buyer behavior in going through the same number of buying stages, implying that experience does not play a role in the number of buying stages used.

The study adopted a convenience sampling method. Only craft retailers that were easily accessible were targeted. The non-response error and the sampling error could not be determined. Although the study targeted craft retailers in SA, it was not possible to target retailers in all the provinces because of lack of data on craft retailers. Some of them were inaccessible because their phones were out of order or the retailers were no longer in operation. Some craft retailers were not willing to participate. It was also not possible to target equal numbers of different types of craft retailers, owing to convenience sampling, fewer large retailers and because some of them were either not interested or they were difficult to get hold of. Owing to the nature of non-probability sampling, the respondents used in the study are not representative of the broader SA craft retail population. Therefore, the results cannot be generalized.
Although the study has identified the stages in the buying process, it did not provide information on what happens in each of the stages and how the stages are executed. Therefore a study could investigate what craft retailers do in the buying process and how they execute the process. This study might not apply to international retailers. Therefore another study could investigate the buyer behaviour of international craft retailers and compare the findings with those of the local retailers. This study could also be replicated in a different industry to investigate how retailers behave when buying other products.

ARCTIC ICE MELTING AND NORWEGIAN PORT POTENTIALS

Maniatis, Antonios¹; Siousiouras, Petros²; Baxevani, Evi²

¹Technological Educational Institute of Ionian Islands, Greece
²Dept. of Shipping, Trade and Transport, University of the Aegean, Greece

ABSTRACT

With the rise of temperatures, the Arctic ice gradually melts away triggering a series of environmental, political and of course economic developments. Besides the vivid environmental concerns and the debate on the consequences, global economy is also expected to experience major changes. Each risk may constitute an opportunity, remark exemplified by the current case. Given that the Arctic will be accessible for the first time, unprecedented development opportunities emerge, as well.

At the same time, navigation will be possible not only in the summer but also during winter months, provided that no action is taken for the reversal of the temperature rise tendency. Climate change is a reality and its effects are going to become more evident as time goes by and the North will become a region of great and broad interest. Norway, not only an Arctic country but also an important one at the global energy map, is expected to hold its place for the coming decades, whereas Public - Private Partnership contracts and concessions may be convenient alternatives for the increased need of infrastructures, generated by the accessibility of the Arctic region.

Keywords: Arctic Ocean, Crimean Peninsula, Environmental change, Maritime Law, Piracy Law, Ports, Norway, Public - Private Partnership (PPP), Russia, Law of the Sea

INTRODUCTION: MOBILITY IN THE ARCTIC

The Arctic is a region that is going to draw the interest of the international community, increasingly in the years to follow, due to a number of reasons; it is about a region of particular interest for the global community as economies, trade routes and international relations will be called to balance on a new set of data. To date, we were used to studying the way human activities affect the environment, focusing on eliminating the negative impacts. For the first time in modern history, circumstances drive us to
examine how environmental change influences human activities and more specifically, politics, business and law.

In the past, the Arctic region did not attract a lot of attention, due to its inhospitable climate. However, Arctic ice melting has turned all eyes on this part of the globe. A new reality is being formed for shipping and modern maritime transport due to environmental change. Nevertheless, compact ice and an ambiguous legal regime cause significant complications, when it comes to matters of ship transit, transport, checks, research, rescue and exploitation of the available natural resources. With climate change acting as “threat multiplier”, the question put is how states will take part in the escalating competition to reap geopolitical and just as importantly economic benefits in a region rich in natural resources. In this context, coastal states are expected to seize the opportunities offered to develop their infrastructure in order to accommodate the increasing traffic. This paper is going to focus on Norway given that this state is an Arctic country, a part of the European economy and its ports are already included in the shipping routes crossing the Arctic Ocean.

Shipping, a sector intertwined with the natural environment, is expected to experience unprecedented development opportunities. Nevertheless, as in every endeavor there are numerous issues that need to be dealt with, before a development spurt takes place. The Arctic is an inhospitable yet promising region; a blend of natural wealth, shorter maritime routes, overlapping state claims and possible escalation of interstate tension. Taking under consideration the unpredictable nature of the region, there is questioning whether it is an economically viable effort. Still, if the global temperature does not begin to drop, this will only be a question of time. Regional states need to prepare themselves for this new reality, either by establishing -if not in place- a policy for the Arctic or by building the infrastructure that will be able to maintain or attract increased traffic and capital movement.

Given the acute economic crisis that affected all national economies and the difficulty to dispose public funds for various scopes, Public - Private Partnerships (PPPs), a relatively new legal and managerial tool, may just be what is needed to go through with the necessary planning and realization of projects that not only will benefit the owner country but they also will become a part of the emerging Arctic economy.
THE REGIONAL NATURAL ENVIRONMENT

The Arctic is most commonly identified with the North Pole or taken in by the “Arctic circle”; for the paper in hand, the region of the “Arctic” entails the Arctic Ocean and parts of the five coastal sovereign states, namely the U.S.A. (Alaska), Canada, Denmark (due to Greenland, a huge island that has become an autonomous state of Denmark out of EU!), Norway and Russia.

New climate data, namely global warming, have caused great environmental concern due to the series of changes brought upon sensitive ecosystems. Besides the environment, however, regional as well as global economy is expected to undergo changes. During the past, with the exception of the Cold War era, the Arctic rarely drew the attention of the global community, given the inhospitable conditions. Arctic ice melting is now oversetting this reality, even causing fears of an irreversible situation.

The Arctic is the most rapidly warming region of the planet and is therefore used as a global climate index due to its sensibility. According to ESA (European Space Agency) and NSIDC (National Snow and Ice Data Center) estimates, the lowest ice levels were observed during the past five years,
monitoring a time period from 1970s when the first satellite observations started, while the rate of diminishing ice coverage increases.

In addition, a pivotal aspect of the region’s prospects is that it is believed to hold around 15% and 30% of the undiscovered oil and natural gas reserves respectively (USGS), 85% of which is expected to be found within the maritime zones of the coastal states. Furthermore, there are significant minerals and fishing deposits. States’ rivalry for accessing these deposits has led to increased presence in the region (either scientific or military, for instance in the form of training) spurring fears of a potential escalation of tension.

AN INTERNATIONAL LAW APPROACH TO THE ARCTIC

The exploitation of resources is primarily claimed by the five aforementioned littoral states while other sovereign states of the broader region, such as Sweden, Finland and Iceland, state their presence, as well. Some of the major limitations of the region concern the pending maritime delimitation issues among the coastal countries. As expected, in a semi-closed sea like the Arctic, state claims overlap and rivalries follow. There is no settled legal and regulatory framework for the region - a prerequisite not only for the energy exploitation (extraction and transport), but for the fisheries’ management and search and rescue operations as well (Borgeson, 2009). It needs to be noted that fish population in the Arctic Ocean is among the largest ones globally, with around 10% of the world fisheries coming from there. However, as ice melts and water warms whilst fish does not abide by juridical and geopolitical schemes, such as rules and national borders, it is not known how they will react or whether they will move to the North, causing additional controversy for the Arctic states (Flores et al., 2003). The United Nations Convention for the Law of the Sea (UNCLOS), signed in 1982 and put into force in 1994, offers the legal framework for the delimitation of the maritime zones and for the resolution of disputes resulting from contested regions. As it defines, each coastal state is entitled to:

Maximum 12 n.m. of territorial waters, where it exerts absolute sovereignty (while beyond territorial waters may start “high seas” ruled by the principle of freedom),

a contiguous zone up to maximum 24 n.m., within which it has rights for specific purposes and

an Exclusive Economic Zone up to 200 n.m. counting from the baselines (from which all maritime zones extend) and where it has rights of mainly economic nature (e.g. exclusive fishing rights, exploitation and preservation of natural resources etc.).

It needs to be noted that the Exclusive Economic Zone is a very important innovation of the UNCLOS, able to change the status quo of coastal states, as in the case of Cyprus.

The continental shelf (maximum extent of 200 n.m. and, on special occasions, of 350 n.m.) on the bed and subsoil of which there are rich natural resources, triggers the rivalries. It is notable that the
extension -if possible- has to be claimed within ten years starting from the date of the accession to the Convention; Finland 21.06.1996, Norway 24.06.1996, Sweden 25.06.1996, Iceland 14.02.1997, Russia 12.03.1997, Canada 07.11.2003, Denmark 19.12.2003. However, the USA have not yet ratified the Convention, hindering their ability to promote their interests in the region and possibly putting themselves in a strategically disadvantageous position on the political chessboard of the Arctic.

The current Law of the Sea comprises the UNCLOS and the Agreement of New York, in 1994, on international seabed, namely the seabed beyond the state limits.

In order to facilitate communication and cooperation, the Arctic Council was established in 1996 (Ottawa Declaration) as an intergovernmental forum for the Arctic governments and peoples. Currently, it has permanent members, namely the five coastal states, in addition to Sweden, Finland and Iceland that are considered to be Arctic states and to other states endowed with a permanent or ad hoc observer status. The main agenda of this scheme revolves around the topics of environment, sustainable development, know-how exchange, accident management, search and rescue operations etc. An interesting point is that security issues were not included in its mandate, following an objection of the USA, which almost all members shared. It is to signalize that four out of the five coastal states are NATO members and that NATO is ruled by the consensus principle of all members for decision-making. After all, security and defence issues are much more sensitive for a sovereign state and therefore they are issues upon which it is extremely hard to reach to an agreement.

Our attention is caught by the number of the countries which signed the Svalbard Treaty in 1920, an early indication of the persisting interest for the region and the involvement of third countries. As expected, neighboring states of the broader region share common interests, i.e. economic ones (natural resources e.g. fisheries), energy ones (energy safety), transport ones (new global maritime transport, search and rescue), scientific ones as well as environmental concerns (climate change, biodiversity). Nevertheless, there are also some third actors wishing to gain benefits from the regional dynamic, such as the E.U. and China. The European Parliament considers the Arctic to be pivotal for the European (and energy) security and is trying to increase its presence in the region as well as to make up for the fragmented legal framework (The High Representative and the European Commission, 2008). New Arctic routes sound appealing to Japan, South Korea (shipbuilders specializing on ice conditions), Taiwan and India. In fact, some of them have already financed scientific expeditions to the Arctic. However, a solid legal and regulatory regime is vital in order to attract international investments.

The importance of a lucid legal regime in the region becomes evident when we think of ecosystem protection (pollution cleaning), search and rescue (increased Arctic tourism and commercial traffic) and navigation regulation as the ship traffic increases (danger of drug or weapon smuggling, illegal migration, terrorism). The protection of international commercial transit has great importance for the
secure transport - an issue that would acquire a hardcore position once commercial and technological change would enable regular maritime use and large scale resource extraction.

**CASES OF RUSSIA’S EXPANSIONISM AND INTERNATIONAL LAW**

It is to pay special attention to the strategic role of the successor of the superpower Soviet Union. Russia symbolically staked its claim to billions of dollars’ worth of oil and gas reserves in the Arctic Ocean on August 2\(^{nd}\) 2007 when two submarines reached the seabed more than two and a half miles beneath the North Pole. A one-metre-high Russian flag was planted on the Lomonosov ridge, a motion that illustrated the new strategic interests of the states involved (The High Representative and the European Commission, 2008). The ridge is an underwater mountain crest that runs 1.240 miles across the polar region. In 2001, Russia submitted research findings to that effect to the UN, but they were turned down.

The current study has become particularly actual, on account of the very recent development in the Black Sea. The Crimean Peninsula, on a basis of a referendum, held in 16.03.2014, became a territory of the Russian Federation. This peaceful revolution of the majority of the inhabitants of the Peninsula, belonging to the sovereign state of Ukraine, has not been officially recognized; but it has highlighted the strategic role of Russia. So, a new important parameter has been added in international relations, the expansionism of the Russian superpower, even against International Public Law. This expansionism is bipolar and to a great extent sea-centred, exemplified by the developments in the Arctic and in the South (invasion in Ossetia and creation of a non-sovereign state there, in 2008, incorporation of the Crimean Peninsula and shortly afterwards the civil war in Eastern Ukraine, in 2014).

**ARCTIC SHIPPING ROUTES AND PIRACY LAW**

Everything has two sides; despite the somber environmental and sinuous political situation, the Arctic is being converted from a region of mainly scientific interest into one of significant commercial and national interest. Ice melting raises sovereignty questions but it also permits the transit of passages (though they remain dangerous due to adrift ice). At present, 4/5 of international trade is carried out by sea (International Transport Forum, 2012) and for a planet composed of water by 70% this is translated into passenger and freight access at any part of the globe. Long-distance maritime routes use “traditional” routes, the main of which go through the Panama Canal, the Suez Canal and the Malacca Straits that are heavily congested. The time required is long and increases the cost respectively. For instance, travelling from Murmansk to Ulsan, Korea through the Cape of Good Hope is 102 days long. Through the Suez it would be 80 days, while via the Northwest Passage, just 55. Besides that, the
danger of piracy, which main routes face, is present and despite the great efforts to eliminate it, it has not ceased to exist. Just the opposite, the “crime against humanity” according UNCLOS, piracy at high seas, has been dramatically come to actuality, the last two decades.

With the Arctic Ocean turning into a bridge of communication for distant regions of the globe, its use could also mean the bypassing of piracy prone locations. Incidents where cargo and crew are captured to be exchanged for ransom are not rare, causing fear for the seafarers and increased cost for the shipping companies. The toll is high, given that fatalities are also known to happen. Should the use of an Arctic route offer the possibility to avoid such mishaps, it could alter the main maritime routes currently in use.

The opening of the ever frozen North Passage and the shorter shipping routes by thousands of nautical miles bring the Arctic to the forefront. Following the example of the Norwegian explorer Amundsen, who sailed first through the North West Passage (1903-1906), and the S/S “Manhattan” (a specially reinforced supertanker) in 1969, the first ship able to follow a route suitable for commercial traffic and carry cargo (accompanied by a Canadian icebreaker), an Open Passage -the ardent passion of shipping since the 15th century- will become a reality. According to estimates, this will be feasible within just two or three decades, adding high value to a formerly inhospitable or even forsaken part of the world. The passage through Arctic waters offers the possibility to detour dangerous passages, it thus offers strategic alternatives to countries like Japan, which would greatly benefit in case it could bypass the Malacca Straits, on which it is currently dependent for its energy supply. Important states, such as China and Japan, which wish to use the Arctic passages, have been attracted, taking under

Figure 3: Piracy prone areas
consideration that nautical miles and fuels are saved, thus cost is saved in comparison to traditional shipping routes.

![Figure 4: Shipping Trade Routes](http://www.grida.no)

When it comes to Arctic Routes, there are two that are currently in use and one which will become a reality, should the climate change proceed in the same pattern.

- **The Northeast Passage or Northern Sea Route (NRS):** It connects the Atlantic Ocean with the Pacific and can serve as a transit corridor for Europe and East Asia, an alternative to the Suez Channel and can reduce the distance by 40% compared to the route through the Indian Ocean. It is a maritime corridor adjacent for most of its part to the Russian Federation. Roughly described as running through the Norwegian, Barents, Kara, Laptev, East Siberian, and Chukchi seas to the Bering Strait.

- **The Northwest Passage:** This route links the Atlantic and the Pacific Oceans through the Canadian Arctic Archipelago and more specifically, starting from Baffin Bay through the archipelago to the Beaufort Sea through the Chukchi Sea to the Bering Sea. This can be an alternative for the Panama Canal, though it can be less predictable due to adrift floes which may block parts of the route. The use of this passage yields significant gains considering that the travel distance from Europe to the Asian markets would be shortened significantly and resources from Alaska or Northern Canada could reach North American and European markets much faster. It needs to be noted that there is a pending issue between Canada and the United States. Canada claims that the Canadian archipelago consists in internal waters, so
ships should comply with innocent passage rules whereas the USA (as the EU) maintain that this region should fall under the international strait regime, implicating free navigation.

• The Central Arctic Route: Should the climate change proceed, it is possible that there would be a point when ships would be able to cross the Arctic Ocean following a straight line. This is far from feasible at the moment and will only become a reality if the entire Arctic ice melts away.

Ice is a definitive factor regarding navigation and time needed for the passing. Although the Arctic routes are not consistently ice-free and often require the escort of icebreakers, ice tends to be thinner, facilitating the carving of channels. Ships are able to sail through starting early July to late November. In summer of 2012, 46 ships sailed through Arctic waters, according to Arctis research group (ARCTIS, 2013) carrying significantly more cargo compared to 2011. In case there is no radical shift in the climatic reality, more traffic is expected for the Arctic routes, a development that could dramatically change the current global shipping hubs.

Figure 5: Arctic routes

Source: http://agmetalminer.com
It is notable that these routes are not expected to become a part of regular shipping any time soon, given that weather conditions not only vary, but they also remain extremely challenging. Even when the passages are free, they are navigable for a limited time frame for shipments and exploitation. Ships with no icebreaking capacity can only use them in summer months and polar class ships are not yet very common. Similarly, the exploitation of the natural resources, although discussed, faces severe hindrances and many prerequisites need to be met before there is easy access and therefore ability to exploit the region’s energy resources. The existing dangers, even when no legal settlement is needed, cannot be downgraded and the retraction of Shell in Kulluk due to extreme environmental conditions causing severe operational hindrances is indicative of the demanding conditions and the thorough programming needed to carry out such projects. The lack of adequate maritime traffic management poses further challenges, in addition to the environmental concerns.

An oil spill in the Arctic would have immense consequences for the regional and global seas, let alone the fact that cleaning operations would need to take place in extremely harsh conditions. High insurance rates, working dangers, uncertainty which discourages commercial shipments due to the extra (insurance) charges involved, big investments needed in the region (infrastructure, icebreaker construction) are found among the challenges. The abovementioned hurdles can easily nullify the advantages offered by shorter routes. Nonetheless, from a geographical viewpoint, sailing through the Arctic would imply great economic profit, given that the travel time is shorter, fuel is saved, the cost of transport is reduced and therefore the final price of the product for the consumer is also reduced along with fewer emissions for the environment.
REGIONAL ACTORS: NORWAY

The 2010 agreement between Norway and Russia, which delimited maritime zones and settled a long-lasting dispute at the Barents Sea, allows the unimpeded use of the waters in question. An unambiguous legal status can not only encourage investment activities but also be considered as a prerequisite, having in mind that precarious environments cause flee of capitals.

Norway is a coastal state with a significant maritime activity. Given that the vast majority of international commerce is carried out by sea, as already signalized, and 80% of the global industrial production takes place at the northern part of the globe, one can easily understand the importance of being at the geographic forefront. Norway has a vested and demonstrated interest in this sub-region.

Although Norway is not a member of EU, it is closely associated (European Economic Area, European Free Trade Association). Its economy is based on oil and natural gas and it is currently among the top energy producers worldwide and the second natural gas exporter (Russia being the first). In the same time, it is not a big consumer and therefore exports the majority of its production, providing among others, the EU with natural gas. The larger amount of the exported oil comes from platforms operating on the Norwegian Continental Shelf (NCS) and there are estimates about substantial reserves in the same region, to be exploited.

The Arctic, being an area of extreme climate conditions, is in need of a different approach in comparison to the traditional maritime routes. Ice conditions and lack of daylight during a long period of time, dictate that states need to cooperate for search and rescue issues, environmental protection etc. Norwegian authorities have opened the NCS to a wider range of enterprises whilst the local reserves attract big international companies. Today, there are around sixty oil companies involved in the Norwegian oil industry, with Statoil carrying out the majority of the activities on NCS.

Given the long coastline, Norway has numerous ports across the country serving as main transport centers. Mongstad, home of the principal refinery of the country, is also a port included in the aforementioned NSR passing. According to recordings (Northern Sea Route Information Office, 2011-2013), the ports of Alesund, Mongstad and Larvik in the South, as well as the ports of Kirkenes, Honningsvåg and Hammerfest in the North, are either start-ports or end-ports for ships crossing the NSR.

PPP AND CONCESSIONS PARTICULARLY IN NORWAY

PPP constitutes an important variation of the concession model, mainly for non-reciprocal projects, exemplified by jails, schools and hospitals (the three categories of scopes of the initial version of PPP, called PFI in the UK). However, concession is still in use, for reciprocal scopes, such as highways, ports and airports. Of course, in legal orders of the UK and the USA and according to a part of the scientific
theory, concessions are considered along with the PPP alternative. Anyway, both types of public contracts constitute the so-called “alternative contracting out” phenomenon. The main advantage of PPP method against the traditional method for public works consists in the fact that the public partner takes advantage from the involvement of the private partner for a long-term or at least mid-term period, having to do with the operation of the (usually non-reciprocal) project.

For the time being, in Europe PPP are most common in certain geographic regions (UK, Spain, Portugal, Italy, Germany, France), not having expanded as much as expected in the 1990s when the term was first put forth. Even today, that there is not one accepted model or even definition besides the loose definition of a cooperation between public authorities and the world of business (European Commission, 2004), the advantages are unequivocal; know-how, experience and practice sharing; maximization of the use of skills belonging to the private partner; optimizing the outcome given the funds or ensuring more funds through the participation of the private sector; increasing the transparency of public spending or even releasing state funds for other purposes; risks allocation.

Among the negative aspects of PPPs are cited the time needed to assess the final outcome, any legal or accounting impediments, the relatively inflexible character of the model in time, and most importantly the compatibility of the sectors involved in each project.

Governments have limited financial resources to allocate for improving public services and infrastructures and this is what led to the PPP model. Currently, PPP activity is not particularly high in Norway; nevertheless, this model is spreading geographically, across Europe, as well as thematically, over new sectors, giving a push to the development and completion of necessary infrastructure, while it releases state funds for social uses.

Commercial growth, continued rise of demand by Asian markets and the subsequent need for faster transport, combined with the environmental conditions and the progress of “ice technology”, may constitute an incentive for the wider use of PPPs in Norway in the hinterland, the coastal regions (upgrading, expansion, construction of ports) or for activities at sea (e.g. extraction platforms). More generally, the European Investment Bank expects investments in the fields of environment, transport, energy and research infrastructure for the years to follow.

It is very important that Norway is nowadays endowed with another region (Barents) for its activities, besides the North Sea and the Norwegian Sea. Should natural resources extraction start systematically and in a wider region by more countries, there will be a need for LNG carriers or even tankers, in addition to the development of the region, which would in turn create more traffic. Infrastructure is a necessary prerequisite for economic growth and will play a key role in maintaining competitiveness vis-à-vis the dynamically emerging economies.
Norway has proved its efficiency in investments and infrastructure with the long-term commitment to the hydrocarbon production. Its economy is successfully a mixed one, with important sectors being controlled by the state. In order to cope, however, with the increasing competitiveness in the region, more steps should be made in this direction. PPPs’ future depends on the evaluation which is yet to follow (positive feedback). Nevertheless, the environment is friendly, also taking under consideration the ranking of the state at the corruption classification (Transparency International, 2013). So, participation of private capitals can therefore be encouraged.

CONCLUSION: THE ARCTIC, A “CENTRAL” OCEAN?

The Arctic is a delicate ecosystem and a complex environment. Until quite recently the resolution of issues concerning this region was definitely not among the priorities of the coastal states, given that the region was permanently frozen and thus unapproachable. However, climatic data have changed what was taken for granted and the Arctic has been gaining importance due to its shipping routes and natural reserves (oil and gas exploration), mining operations, hydropower development, military advantages etc. Development attracts tourism at this remote part of the globe. High demand and carbon prices along with energy security unrest during some time period would justify the need to explore new energy sources and the costly and time consuming infrastructure the Arctic needs. Due to these new routes, maritime traffic is expected to increase in the region, making the passages significantly more important in economic terms. Radical changes are not expected any time soon, but the motives of lower transportation costs in combination with exemption from piracy high risks, of less time and of fewer emissions are far from negligible, therefore coastal states need to be able to host this traffic and reap benefits. Norway, a state with a strong presence in the European market and at the top rankings of the exporting countries, can use the PPP method to exploit the opportunity of attracting ships to its ports to become an Arctic hub. Despite the difficulties and the challenges of cooperation between such diverse partners, the expected benefit is too great to ignore. In the years to come, the Arctic may become a “central” ocean, given the geopolitical, environmental and economic stakes. Directly concerned countries, like Norway, need to plan ahead so that they won’t be left to follow puffing the leading actors, either state or business ones.

***

The Greek word for Freedom (“Ελευθερία”) etymologically signifies the coming motion, so the faculty of moving from place to place. So, the physical faculty of transport ties in with the legal faculty, namely the fundamental right, of Freedom. As a result, a “new” Ocean emerges, the Ocean of Freedom, historically exempted from international law crimes against humanity, such as piracy attacks. The great challenge for international community is to promote the Ocean of Freedom, being anyway a spot of
“high seas” according to the International Law, even against the five nearby states, to the “Bridge” (“Pons” in Latin) of Safety and Sustainable Development. All states involved, let alone the superpower of Russia with recent cases of bipolar expansionism, should comply with this diachronic rule.

Last, but not least, Norway, a country ruled by Nazi empire for its potential use for nuclear energy in the Second World War, has a major motive to contribute to an environmentally friendly, peaceful use of the Arctic. Ice melts, do friendships emerge?

WEBRELATED BUSINESS COMPANIES STRATEGY FOR NEW CUSTOMERS

Marsiglia, Bruno; Evangelista, Federica; Celenza, Domenico; Palumbo, Emanuela

Department of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT

This paper provides a study on web related B2B (Business to Business), B2C (Business to Customer) evaluation of strategy and methods for maximizing (expanding) the number of customer among the people (i.e. internet population), using cycling process externally for internal process of strategy which explains business exploration and agility, and online consumers their compulsive buying behaviour with a new strategy to capture them in large number. The web based industries are web based companies and web related companies, we concentrated on web related company through new innovative method called B2P (Business to People/Public) a schematic approach strategy diagram of B2P, and with external Process of strategy.

The B2B and B2C (Business to Customer) used by enterprises in peer to peer process is based on a qualitative approach, our sourcing of data has been carried out through secondary sources (paper, articles, open source).

The findings are with new schematic diagrams designed and drawn by us with an idea and proposal and approach strategy for attaining people interest in the online industry specially concentrated as example on online book selling company.

The originality of this paper called concept B2P is from different sources, examples, online articles and built on industry leaders advice through "linkedin.com" and web blogs.

Keywords: strategy, B2P, branding, internal process, online book company or industry, web related, web based, customers, external cyclic process (data collection).

INTRODUCTION

This article attempts to evaluate and investigate the steps of technology strategy in online industry trends to attract people to become a customer, especially in the area of online business (Vrontis and Thrassou, 2007) web related and web based companies, technically so called e-commerce firms, and in their new strategies in the changing (Sia and Lee, 2006; Mandelli, 2000) the idea world for better
future business. The web based and web related companies generates each years on average 1.2 million jobs, they are small and medium enterprises with much high field business in different sectors.

After the invention of internet, day by day, the number of user are increasing as per the reports till 30th June 2012 the population 2.405.518.376 (http://www.internetworldstats.com/stats.htm) and business expands in to multi domain sectors. The enterprises use today a web technology and sites for better feasibility of business, we would like to introduce B2P (People/Public) concept in a highly regulated industry is the web related technology industry by innovators and risk takers who understand that tomorrow's success relies on today's relentless challenge of the status for future business based on B2B and B2C. We are introducing a bivariante broad perspective B2P concept, which evaluate and invent a new strategy on cyclic process which explains business exploration and agility and online consumers their compulsive buying behaviour with a new strategy of capturing costumers in large number.

The web based enabling technology helps the web related companies to generate most of the percentage in the business online, we will discuss the credibility and trust in online companies and new strategy to brand making like Amazon.com. The e-commerce industry is widespread importance of e-branding, prevalence of collaborative and customer-centric e-brand building strategies including co-branding and affiliating with established online and offline brands, distribution partnerships, content alliances and personalized e-mail contacts. The internet companies (Eisenmann, 2006) also seems to have employed a variety of traditional techniques.

The proposal is provided with idea of new concept called B2P (People/Public) which would support the expansion in numbers through cycling process of data analysis and by new strategies, and attracts the people to become a customer in web based and related companies, when it comes to web base they more into technology and transfers in to business for web related companies (i.e. we based companies enables, platform for new business enterprise), so, we would like to concentrate more on web related companies example online book seller and document article business, we are trying to focus what inspired to shift in strategy from B2C, B2B a new trend approach B2P with schematic diagram and strategies.

The research approach is based on qualitative methods, starting from a single method approach. The research is developed according to the study of international literature and from blogs of industry leaders.

This article has the following structure, from introduction, the section one provides a literary review of methods used to evaluate web based and web related companies, particularly, the study focuses on B2P (People/Public), it discuss in later section about what measure and data collected as empirical
evidence how the literature are, then the research approach explains what are the steps we gone through to write a finding with schematic diagrams with new concept of strategy B2P and the last section includes conclusion with the limitations of the study and suggests future research.

LITERATURE REVIEW

Many authors wrote about the internet based companies and strategies, after careful review of articles in the internet and few authors statement, unfortunately, first-generation e-commerce strategy (Vulkan, 2003) books were long on vision but short on detail. If the customers are moving online whole information technology (Warner, 1987) investment paradigm must shift, we tried to structure this widespread strategy problem for attracting people, to become a customer (with example of online book selling company development). Hence, the proposal is to provide a study and new way of categorizing the conceptual customer and other people to expand the business with strategy. The concept called as B2P (Business to People/Public).

The “Bill McChesney” IT Executive, from Large federal systems integration firm says while online consumers are less concerned like “sending your clone to work” or “outsourcing your exercise” people voted for cloud because of it possess shift to infrastructure transparency in which not to think about servers and storage give perfect solutions. And the traditional consumers about firm location maybe more concerned about unobservable quality, and to signal this, online retailers rely more on advertising than traditional retailers, the imperfect price competition may arise because of vertical product differentiation, incomplete consumer awareness and near‐perfect information exchange between retailers.

In online book industry the 100% profit per customer /consumer electronics/appliances Books Groceries Apparel Amazon trumped its rival once more by providing ratings of individual book reviews, so, yet everything they do in a virtual store cannot tell the online retailer, then how to trust online money transfer and company credibility, and if so, people buy books, but these questions always raised to the online company amazon.com. The past case studies and reports posed a notion of fraudulence in the transaction in the sense of money and data management.

The revenue data for the online book market reveal that consumers respond to advertising and website spending rather than low prices (Zott et al., 2005). Lim et al. (2006) says the trust in the online trading is based on quality of service, and if so, the customer will buy the goods evaluated through an empirical study of trust-building strategies. And the Greenfield (2001) explained posing approaches toward the business online in the prostration, the gaining is important, people are in N number it is ocean how much you grab, how much you gain in end of day is branding.
The leading-edge online tools in communicating their key to e-brand values and promoting their online platforms, considering for example in the case of online book selling company, what few people know is that the first online book selling is not amazon.com, the other was started before, but failed in reaching potential customers or not into globally and stacked only to the regions, where trend and strategy missed led them to be behind the competitors.

RESEARCH APPROACH

This qualitative research approach (Myers, 2013) is centred on the structural management of web related companies and web based companies for gaining customers with B2B and B2C strategy. The international literature on this topic is analysed.

Starting from the general understanding and data collection approach and strategy, data acquisition (Yin, 1994) was achieved through secondary research sources specified as follow:
- scientific books and articles;
- database such as Google scholar and e-marketing companies;
- schematic diagram’s (internal and external process).

The application of new B2P concept and schematics diagram’s for representation as well for strategy to attract People/Public to become a customer by internal and external process. The proposed research findings coming from a schematic diagram and references form the scholars article empirical application a new idea of B2P (continues cyclic process for customer gaining) strategy, marketing (Mandelli, 1998) utilizing methods through schematics diagrams.

FINDINGS AND DISCUSSION

The concept of B2P generates a coherence and brought up base form B2B, B2C, and the key point for webs based companies and web related companies business established competitors to remember that innovation involves two essentially different activities coming up with a new technological, strategic (Burgelman and Maidique, 1988) or productive idea and then creating a market out of it. For an innovation to be successful, both activities have to be effectively coupled, but there is no need for the same organization to do both, one company may come up with a new and disruptive way of playing the game and another may take the idea and run with it. The findings section would explain how the strategy utilities and options are explored to grab most (Public) of attention.

The web based companies are crucial role in advancements, the online enabling tools makes user to be free moving and hassle free surfing with more optional and fast process obviously the big dealt in the online market in web based organization is "Cloud Technology".
We consider the next big trend after cloud computing might be PAAS is a Platform as a service, enables to consumers more on controlling of what and where they publish their info, and businesses want to manage subscribers and advertising recipients as discrete persons, rather than as a set of email and phone contacts that might be overlapping, and might be peerclinc, is next big revolution "P2P plus Cloud " once we move all critical systems to the cloud, we will be totally dependent on having network connectivity that would lead business for longer motion and time.

This paper concentrate much on web related companies, we would like to present an example of online book industry who sell and market for publishers, the trend, theoretical strategies are meant to be common for most of domains.

The revenue data for the online book market reveal that consumers respond to advertising and website spending rather than low prices as the market size expanded during 1997–2001, these endogenous sunk costs escalated, advertising-to-sales ratios and market-concentration ratios are much higher than for traditional book selling, using price and demand information for individual books over a number of weeks, we can find counter cyclical and cross-sectional price variation inconsistent with perfect price competition.

The two conflicting predictions have emerged regarding the effect of low cost information on price, first one states that all internet retailers will charge the same low price for mass produced goods. The second states that internet retailers will differentiate to avoid intense price competition (data collected in April 1999 on the prices of 107 books) in thirteen online and two physical bookstores, we find similar average prices online and in physical stores and substantial price dispersion online.

The best formula of the buyer always values in the result of benefits which mines from costs, since methods explains how the customer are, we started to concentrate on broad prospective in N (infinitive) number of people, then we come across a new split of people who are customers and might be customers and visitors by category, in order to increase number of selling irrespective of ages, considering the book online store with different category book from arts to technology (end to end type).

The internal process split diagram 1 explains the basic split of people for business and parallel the external life cycle with measurement analysis regularize and make understand for change strategy (in order to gain more customers) in the diagram 3.
Diagram 1. *Internal Process Split (Methodology) B2P*

The B2P internal diagram (predicted split diagram.1) for future strategy split into A, B from people, where the A split line represents who are already a customer (all the existing customer comes from people he/she might be a enterprise/institution representative or a small book shop for bulk order or individual customer) in A category. By keeping up offers and long-term subscription, coupons with special delivery package would benefit to sustain customers long time. The category B represents NC (not a customer's) but the they can be active as register user and visitors.

The registered users are from the non customer in terms of buying books online, we have sub clarified registered users as news letter subscribers and subscribers for offers who do occasional transactions. The news letter subscriptions are a good idea which intended to be part of companies announcement and latest deal and but the not interested buyers are 50 percent, and since the subscribers of offers and newsletter subscribers are similar in theory but they are different in action, the subscribers for offers are people who tend to be potential buyer, when they are need of a rebates and coupons issued on purchase.

In the category of visitors, the people are, who impressed by variety of books in online store always wanted to be up-to-date about their favorite book, then after sub category are visitors sub classified as...
observers (might be general people or competitors) and people who want to keep in comparing the books published and who wish to be future subscriber a slow and study mood people fall in to this category.

The unexpected visitors and others are directed through adds (or) unintentional clicks, or people who are academic researchers and students searching through Google or Yahoo search engines, and who don't check the site ever ideal people large in percentage category "F", we try to evaluate and capture the people through cycling process and schematic diagram and we are going to evaluate these people under objectives, in order to make them as online buyer.

Let us assume by taking few indicator, the registered user are sub category register, the inbound marketing strategy an effective website strategy includes several components beyond the obvious. Like lead nurturing email campaigns, downloadable white papers, targeted ads based on visitor engagement, segmented newsletters, and more. Each strategy should be carefully considered based on the complexity of your sales cycle.

We understand how much education is required to reach close a potential customer likely to depends on education and the marketing plan. The product relatively simple and volume based, the customer likes product. The product require complex integration (or) contact from a sales associate and has to check customer care standards and antiquities; always better to checking the numbers of consumer segments does company target.

Writing a book online is a business which is reviewing the articles or books by others and increasing number of hits resultant in to sponsorship, branding for future, increasing brand value even by not selling or not served the direct service (net work sites, knowledge sites) might have a chance to result business mind run and long runs by turning the non customers in to potential clients. The Europeans (Zott et al, 2000), buying on-line to continue exponentially from 13.5 per cent of the online population.

Through the book reviews and discussion forums which are a form of virtual community a relatively new online bookstore called iBook, and how web based markets online auctions and electronic exchanges can overcome debacle calls trust with unknown people for trading money and for books and parallely gaining the customer through the strategy we would see in the predicted strategy diagram.2.
Literally we are presenting above an indirect form of 4'Ps for our business strategy, which are Product, Place, Price, Promotion, but by preference order according to the category of people fall in. We are going to discuss the resulting solution and topics motioned in diagram 2 from D and E step by step strategy in different order.

The wishes on occasions and book review information attract subscribers and make them feel comfort and trusted in relations with customer by wishing in every accession, and special movement sharing a review will bring the companies to transfer registered customer in to buyer "customer comfort is money".

Diagram 2. The solution of Diagram 1
Then the logistic channels of the distribution, "Scribnet" is the example for review in book stores, permit to people to upload their documents and spread a word across about customer books and articles, reporting a performance of the new product (books) and company policies to reach higher customer satisfaction and new launches would increase the satisfaction and trusted level and another step would be subscription offers and book offers with low cost like offering a lifestyle membership, by providing the highest form of maturity membership that gives access to many different products and experience beyond own product. And the next is contracting with companies who want to extend beyond their core product offering like offer an ecosystem of suites and products companies in tenuous markets, example Peugeot’s Mu program gives consumers access to cars, bikes, buses, vans and more for rent on deduction through the online book store, and announcing an offer on separate mailing list who are in contact with the company longer than a year and encourage for feedback and blogger updates.

The user friendly web design and cost comparison is the best idea of attracting people, most of website in the web related companies like online book selling company don't concentrate on friendliness of website and maximum percentage chances for user satisfaction to word custom web environment is unsatisfied need to utilize latest technology pro dynamic website design, and the cost comparison of on line book aligned with the rate of current company and with competitors would be the better option for new orders and increase in the sales.

The after contracting and offers would pass-on to the availability of realization of on demand goods, if you have a high-cost, or high-consideration product, low usage product, considering offering it on demand, through a shared access model like amazon.com. The legitimate offer always be pricing of books and term subscription offers change by time under competition are fixed pricing, dynamic pricing, bartering but always the buyers principle falls under value is benefits minus costs.

After pricing and designing the customer care experience is the most important part of query transaction, information purpose about books derives most efficient, and TAT (turnaround time) generated customer care companies appreciates with the higher inflow of people to the company for business (whether is maybe through e-mail or tail call) all about the antiquities.

Always the first step to gain a customer from people is tell them an incredible story, no one cares about features until they understand the solution, whether company creates software (or) sells books online, or point of sale terminals for retail outlets it's the results that matter, but delivering truth and realistic things important and making a blog for the people who want to visit and update and discuss about technologies authors, anything which would gives a scope to communicate with other users is a better option of branding the business.
The one more option explained in diagram is SEO tracking and by third party, the search engine optimization is a new way of business by number of hits and first in first out formula believing system, how many clicks and how many times searched in the search engine makes the company to appear in the top list for reputation and for more opportunities to advertise optimizing the website more feasible standards. However, in the companies the idea of giving contract to the third party depend on the revenue and market share of the online book company. The attractive website may appeal to a broad audience, it's critical to test, and re-test website pages in an effort to optimize user experience and results.

The quality expressions is one of the factor that focus on quality of service and books, we know teams used to spend thousands of hours writing pages of website content going into excruciating detail about every feature available, sadly this instinct will dilute value proposition, and slow the buying process dramatically, keeping things simple will build trust and understanding early in the buying process.

The last section but not least important option creating people as customer from ideal people "F" category, the ideal people are most important to the market, where a need of bringing these potential buyer from physical to online, we choose traditional and few programmatic step to attract and make them internet friendly for purchasing books online and store canvassing and general digital marketing, the example canvassing in the electronics shop about electronics book on free touch screen display and encourage offers on buy. A lot of careful thought goes into the planning phase of digital projects prior to the design, or development work begins, this process is essential for strategic design that achieves business objectives, and follows optimal user experience, marketing is the predominant part of strategy (Rappart, 1979), the past writer missed posing a strategy where online book company can make a contract, to the different filed related shops and libraries, beauty salons and gaming points with setting up of touch screen web panel for people.

This experiment results into huge number of customer and generation of money by selling books, then the user starts to equate with internet and screen environment, slowly attracts toward to the ads on the screen and book display, online RSS (Really Simple Syndication) feeds cookies tracking, placing add in institutions commune's, libraries, advertise in gaming area, beauty sites.

This kind of tools help to improve performance and increase the satisfaction internally which would result into external customer increase to the company, both consumers and service providers take advantage of the many benefits it has offered. The adoption of virtual applications, architecture and service orientation computing are some of the factors that should be considered when thinking of cloud computing. We predicted and drawn a external cyclic process diagram. 3 which dealt with the market research on public data and behavioral analysis to find potential consumer form people, it's a continuous process irrespective of time.
Diagram 3. External life-cycle process

The cyclic process fallow and support the internal process to gain new customers from the N number of people. External process starts with collecting market data of people who are internet users and Ideal non internet users using tools and market research, human resource and building documentation, structuring appropriate data from bulk according to objective set for first cycle and to transfer in to decode an transfer process where data into strategy, reaching to people of specific slot or set area compiling to measure for approach, where the strategy measured with regression models, into pure graphical representation, after approach with plan on line marketing through tools and agencies, until reaching objective to hold on more people, further migration of process to the Internal Process, it makes a new strategy based on external results.

CONCLUSIONS

If we want to sell toilet paper then we could start a toilet paper business right now online and if we truly kicked on to notch could make a living. My point is it's not what you sell as much as you believing that it will work, work hard, and work very smart to make it happen.

In the paper we tried to evaluate online business growth on base of new strategy gaining in long term by cyclic order and with collective analysis of data with management. We gave notions how the strategy can be further divided and evaluated for trade in the results to the business. The strategy,
exploration and agility discussed how the people are and how to capture them from different platforms, and the online consumer compulsive buying behavior analyzed.

But the paper provides enough notions and sub categories for the idea purpose, more incite work can be possible in future with web related industries connecting with B2P (people, that means increasing the number irrespective of age and specific area of interest) expanding till to end through step by step evaluation.

In light of the consideration made, it is appropriate to point out that this research is based for further that will address current trends in the field of web related companies strategy for gaining people as customers with a new concept called B2P (Business to People/Public) under cyclic process.

The example internet based strategic idea of business, we have noticed a company for knowledge sharing on consultation who are joint experts in the field and employees of other organization, through money grows in parallel and on form of KPO (knowledge processing outsourcing) competitor without. hug set up as KPO. Example “Mavan” (www.mavan.com).

UPDATING ENVIRONMENTAL KNOWLEDGE THROUGH A KNOWLEDGE MANAGEMENT MODEL

Martinez-Martinez, Aurora¹; Cegarra-Navarro, Juan-Gabriel¹; Garcia-Perez, Alexeis²

¹Universidad Politécnica de Cartagena, Facultad de Ciencias de la Empresa, Cartagena (Murcia), Spain
²Faculty of Engineering and Computing, Coventry University, UK

ABSTRACT

A review of the literature confirms that a knowledge management framework which supports knowledge creation is required, particularly in those organisations having to deal with a changing environment. Socialisation, externalisation, combination and internalisation continue to be key processes for the creation of knowledge which enables organisations to successfully address environmental challenges. This paper examines the relevance and importance of a SECI model as an enabler of the processes of reusing and updating of environmental knowledge of an organisation. The research reported has confirmed that time is a key component of the implementation of a SECI model in organisations operating in a changing environment. It has been confirmed that such a strategy should focus on the reuse of prior environmental knowledge as a mechanism to establish within the organisation a context where new knowledge management processes are understood and adopted by employees. The paper also examines the relationship between environmental knowledge and organisational performance indicators. These relationships are examined through an empirical study of 87 companies in the Spanish hospitality sector. The results indicate that environmental knowledge at a given time (T) is found to be significant in predicting the knowledge management processes at a later point in time (T+6).

Keywords: SECI model, environmental knowledge, hospitality industry, performances and time.

INTRODUCTION

Environmental knowledge has become one of the most important intangible assets for organisations in the current competitive environment (Po-Shin & Li-Hsing, 2009). Environmental knowledge can be defined as the degree to which an individual or organisation becomes aware of and concerned with ecological issues (Amyx et al., 1994). Environmental knowledge may be thought of as comprising stocks of data, information and knowledge resources (environmental memories) that have been gathered and accumulated by an organisation by virtue of its knowledge structures (Chou et al., 2005). While the relationship between environmental knowledge and organisational performance has been
addressed by several authors (e.g. Boiral, 2002; Boiral, 2009; Cegarra & Martinez, 2010), there has been surprisingly little empirical investigation of the effects that environmental knowledge can have on knowledge management process (and vice versa) over a period of time.

Time has traditionally been considered in the management literature as a constant rather than a variable, a belief Bluedorn (2000) ascribes to people in general. Furthermore, as Bluedorn notes, the understanding of time as a constant is deeply institutionalised, which suggests that most people, most of the time, do not even consider the possibility that time may vary. This suggests that one should speak of ‘times’ rather than ‘time’ (Purser et al., 2005). In this study it is assumed that ‘times’ are sequential and enable first creating an environmental knowledge and then putting the upcoming environmental processes into a familiar context for members of the organisation. The question that arises is whether a knowledge management framework is needed to reuse and update prior knowledge of the environment and if so what can be done to face environmental challenges in the coming years (Cegarra et al., 2013).

In this regard, the SECI model (socialisation, externalisation, combination and internalisation) provides a good basis to explain the adoption of new environmental knowledge (Nonaka & Takeuchi, 1995; Nonaka et al., 2000). This paper aims to offer an empirically tested SECI model which helps identify how prior environmental knowledge in the Spanish hospitality sector may be reviewed and updated through the development of knowledge processes at a later time. In the conduct of this research, we have addressed the following questions: Does availability of environmental knowledge at a given time necessarily mean the use of environmental knowledge at a later time? How can hospitality companies update environmental knowledge resources? By addressing these questions this paper demonstrates that the availability of environmental knowledge at a given time does not necessarily guarantee the effectiveness of environmental knowledge at a later point in time.

The longitudinal study described in this paper involved two observations of the same variables over a period of six years (2008 and 2014). The proposed theoretical framework is presented in the following section. Details of the survey which was used to collect appropriate data to test the model is presented in section 3 and the results of testing the models are detailed in section 4. The results and managerial implications are discussed in section 5 which is followed by our general conclusions in section 6.

THE PROPOSED RESEARCH MODEL

*Connecting the SECI model to environmental knowledge*

Sustainable development is one of the world’s most important priorities in order to attain the well-being of mankind (Nouri et al., 2008). In the Spanish hospitality industry the growing interest of tourists in the environment has led to the promotion of ecotourism, and with it the efforts to develop
strategies that focus on the environment (Brockhoff et al., 1999). The concept of environmental knowledge has been invoked to characterise the way in which organizations align their strategic goals to sustainable development (Wernick, 2003). This means that organisations with environmental knowledge will know what can be done about environmental problems and they understand the benefits of environmentally responsible goals (Frick et al., 2004). As Po-Shin and Li-Hsing (2009) suggest, environmental knowledge involves what people know and are concerned about regarding the natural environment, their responsibilities towards environmental protection and the relationship between the economy and sustainable development.

One way to gain environmental knowledge consists of developing a continuous process of dynamic interactions between strategic goals and environmental challenges. As Martelo and Cegarra (2014) noted, knowledge in a firm emerges both from inside and outside the firm. By doing so, the SECI model may play an important role in the creation of environmental knowledge since it is a way of transferring knowledge to refine the knowledge existing within the organisation while also improving the effectiveness of its search and retrieval strategies. A key argument supporting the SECI model is that knowledge held by individuals is shared with other individuals so it interconnects to a new knowledge (Nonaka et al., 2000).

Nonaka and Takeuchi (1995) suggest four dimensions of the SECI model, each playing different but complementary roles in explaining how knowledge can be created in organisations. While sharing tacit knowledge between actors is considered a socialisation process, tacit knowledge becomes explicit through an externalisation process. This conversion is due to a social process between groups and individuals (Nonaka & Takeuchi, 1995). While the ability to maintain the explicit knowledge within the organisation is defined as combination, internalisation happens when explicit knowledge transforms into tacit and thus becomes part of an individual’s expertise. Therefore, internalisation means understanding explicit knowledge.

The creation of environmental knowledge supposes, in this case, the reactivation and development of new information about events, trends, and relationships in the external environment of the organisation. For example, if there is no prior knowledge or history associated with environmental issues, then a failure to act towards achieving the strategic goals of the organisation may result in a search for environmental knowledge at a given time (T). This, in turn, fosters learning and therefore the absorption of new knowledge by employees (Choo & Aust, 1993). As Boiral (2002) points out, this knowledge includes employee compliance with new practices. Some of these new practices include the exchange of information and sharing of environmental concerns (Fryxel & Lo, 2003), the acceptance of constraints related to the prevention of pollution (Cordano & Frieze, 2000), and collaboration with technical services to develop cleaner processes (Aggeri, 1999).
The above considerations have led us to frame the first hypothesis of our study as follows:

**H1**: The SECI model at moment \((t_0)\) has a positive effect on environmental knowledge at moment \((t_0)\).

**Connecting environmental knowledge to the SECI model over time**

As competition intensifies and the pace of change accelerates, it is likely that aspects of environmental knowledge (e.g. environmental routines and procedures) will change over time, requiring the modification of some knowledge structures (Aggeri, 1999; Brockhoff et al., 1999). Prior research has also shown that the effect of environmental initiatives on business performances can vary substantially in a turbulent context (Cegarra et al., 2013), such as the Spanish hospitality sector during the period we have examined, under this framework it is necessary for hospitality companies to update what they know about environmental issues (Cegarra et al., 2013). It should also be noted that a set of authors are focused on time as variable to be taken into account. For Gist and Mitchell, (1992) an individual’s level of self-efficacy can be expected to change over time as new information and experience are acquired through direct experience with the task, performance feedback, and other factors. In this vein, Adam’s (1990) work shows, that “causal time” is seen as one-dimensional, structured in terms of past \((t_0)\), present \((t_1)\), and future \((t_n)\).

The above considerations lead us to argue that once prior knowledge and skill are assessed at a given time \((T)\), there is a range of potential responses by employees, which are determined by the type and characteristics of the challenges. In addition, impact and importance of environmental knowledge varies over time and prior environmental knowledge can soon become outdated or obsolete at a different point in time. There may be a number of different ways of understanding the concept of ‘time’. In this regard, Crossan et al. (2005) focus on three characteristics of time, namely:

a) Time as a trigger for change. As Gersick’s (1991) work shows, groups with very different characteristics change their behaviour when approaching the middle of the span of time they have to perform a task;

b) Time acts as a coordination mechanism for change. Time creates a shared calendar for change and, thus, serves to schedule activities and to maximise their synchronisation (Hedberg et al., 1976); and

c) Time as a resource for change. These considerations lead us to argue that ‘time’ provides organisational members with the temporal space they need to reflect on and conceive prior environmental knowledge (Tyre et al., 1996; Eisenhardt & Brown, 1998).

Our focus is the relationship between casual time and environmental knowledge. For the purposes of this paper, we suggest that environmental knowledge is a process that happens over time, and takes time to update it (Lei et al., 1999; Purser et al., 2005). In this ‘from-to’ causal structure, whatever arises in the future has its origin in the past (Tulku, 1994), that means that hospitality companies which are responding to a series of new environmental challenges are forced to ‘think and act over time’
(McKenna, 1997), and demands for instant responses frequently means relying on prior environmental knowledge (Purser et al., 1992). Therefore, when the rate of change itself is steadily accelerating, this means that it becomes highly problematic whether the environmental knowledge needed to increase company benefits can be accessed in a timely manner (e.g., Rondinelli & Vastag 2000; Zhang et al., 2000).

Over time environmental issues and management challenges are likely to change (Bohdanowicz, 2005). An example of this is the emergence of new environmental regulations which may go far beyond the current company’s plans to issue new standards for greenhouse gas emissions. As these environmental regulations change, it may become necessary for the organisation not only to exploit their prior environmental knowledge about these regulations but also to update (i.e. replace) such knowledge. Hence the ability of a firm to combine prior environmental knowledge with new one over time is therefore essential if a business is to align its processes, products and services with new challenges to face changing environmental issues. This is where a good knowledge management program such as a SECI program should distribute the new acquired information amongst all the employees involved in environment-related activities, codifying and storing such information for future uses, retrieving past successful environmental experiences, but also being able to continuously renovate past environmental experience with new acquired knowledge (Carmona-Moreno et al., 2004). As a consequence, the SECI program at a later point in time acts as a facilitator in the relationship between EK at a given moment and EK at a later point, since it means that new environmental knowledge can be socialised, externalised, combined and internationalised using past knowledge and also used in the innovation process.

Therefore, we propose the following hypothesis:

H2: The impact of environmental knowledge at moment (EK_{t}) on environmental knowledge at a later moment (EK_{t+n}) is positively mediated through a knowledge management program (SECI_{t+n}).

Connecting environmental knowledge to organizational performance

The Spanish hospitality industry is a very complex one and requires intensive use of knowledge resources to successfully operate in a competitive market meeting the increasing needs of it customer (Claver-Cortés et al., 2006). In hospitality institutions, staff need appropriate and up-to-date knowledge to face a number of environmental challenges, including the need to implement new customer engagement strategies such as those based on social networks), increasing customer demands and global competition to reach and recruit customers (Chandana, 2001). These considerations lead us to argue that updated environmental knowledge plays an important role in the improvement of organisational performance since it facilitates a situation which, when something is being done wrong, the organisation can change to quickly resolve it (King & Lenox, 2001), which in
turn may help hotels achieve their operational full potential (Cegarra et al., 2010).

As the customer profile changes (e.g. physical location, behaviour, environmental preferences etc.), it becomes an imperative for hospitality companies not only to revise and update the environmental knowledge but also to effectively use such knowledge. Using up to date environmental knowledge have a positive effect in the public’s perception, which is likely to result on more visits to the hotels and benefitting from the use of their installations and services (Carmona-Moreno et al., 2004). As Boiral (2002) noted, the existence of environmental knowledge helps both companies and customers obtain beneficial results. For example, hotel operators encourage their guests to participate in new programmes to reuse their towels, which benefits the environment but also help reducing laundry expenses. Therefore, hotels equipped with up to date environmental knowledge can provide a more competitive way to deliver services, which could enhance the public perception as the company is seen to be socially responsible (Erdoğan & Tosun, 2009).

Hence, we state that:

\[
H3: \text{The existence of environmental knowledge will determine the extent to which the company achieves better organizational performance}
\]

Taking into account all of the above, this study proposes the structural model shown in Figure 1. In summary, a firm with a SECI program possesses a key capability for the updating of environmental knowledge. To manage prior environmental knowledge effectively, firms must put in place a SECI program at a later moment that enables employees to update their assumptions and then replace new or modified environmental knowledge. Finally, firms with a SECI program will be able to use up to date environmental knowledge in order to improve organisational performance.

![Figure 1: Theoretical model](image)

**RESEARCH METHOD**

*Data collection*

The focus of the data collection process was the Spanish hospitality industry, in particular the section dealing with hotel operation and management. Hotel operation and management is a very relevant sector within the Spanish economy (Cadarso, 2005). Spain ranks second in the world in this sector, both in terms of the number of travellers (behind France) and in terms of income from tourism.
This industry reported 11.8% of the Spanish gross domestic product (GDP) in 2002 and 12.1% in 2001 (Claver-Cortés et al., 2006). Regarding the employment generated by the tourism sector, estimates indicate that it usually absorbs 10% of the total employment available in Spain. From the total Spanish population, over two hundred thousand people worked in hotels and guesthouses in August 2003 (National Statistics Institute Information Bulletin, 2003).

The reasons for choosing the Spanish hotel operation and management industry were twofold: on the one hand it is very important for the economy; on the other hand, it is a sector facing an increasing level of environmental challenges. For example, hotels have to operate in an environment dominated by high fixed costs. The management often has to deal with issues related to staff wages, significant utility bills and the expenses derived from maintenance of rooms and facilities. Managing a profitable hotel becomes a challenging endeavour, particularly in a period of recession. In this regard, 2008 was the year when the tourist industry did not contribute to the growth of the Spanish economy for the first time ever. Just the opposite, the income generated by the tourist industry in Spain decreased in 1.1% with respect to 2007 (National Statistics Institute Information Bulletin, 2008). Also, the Spanish hotel operator industry is an appropriate setting for an investigation of knowledge management practices and their impact on environmental knowledge. This is because companies within this sector have to face up to highly dynamic environments, strong competition and rapid advances in technology. As Carmona-Moreno et al. (2004) state, the environmental policy in hotels is fundamental for their results, as these depend, essentially, on the environment in which hotels are located. Thus, the preservation of the environment becomes a crucial factor influencing hotel operations. This preservation therefore requires an intensive use of new beliefs, norms, values, procedures, and routines.

The unit of analysis for this study was the company, on the assumption that aspects relating to the creation of environmental knowledge affect the entire organisation. Relevant data sets were collected through telephone interviews with the CEO or owner of the business using a simple structured questionnaire. We made use of a list of 560 Hotel Operators provided by the SABI1 database (from the SABI Database based on the statistics for the year 2006) as an initial sampling frame. All companies were included in the CNAE-552 (The Spanish National Classification of Economic Activities 552) and had more than ten employees. Before conducting the surveys, the businesses were contacted by telephone by our team and invited to participate in the study. Potential participants were informed of the objectives of the research and reassured of its strictly scientific and confidential nature, as well as the global and anonymous treatment to be given to any data collected. In total, 560 companies were

---

1 Sistema de Análisis de Balances Ibéricos (SABI database) contains financial information for 520,000 companies (480,000 from Spain and 40,000 from Portugal). This includes public and private, Spanish and Portuguese companies, with up to 10 years of data, updated daily.
contacted by telephone and invited to participate in the study. A total of 245 companies agreed to participate in the first instance. These 245 companies were then contacted again for the purpose of data collection. Participants were asked questions about environmental activities carried out by their hotels and the learning processes implemented to create environmental knowledge in a context of intensive innovation.

Data sets were gathered in two phases, the first of which lasted two months, from early September to the end of October 2008. From a sample of 245 companies, 127 companies responded to the survey. The size of these organisations (in terms of number of employees) can be described as follows:

- 41 of these companies have 10-49 employees,
- 59 companies have 50-249 employees,
- 18 companies have 250-499 employees, and
- 9 companies have more than 500 employees

This produces a response rate of 22.67% of the total number of companies invited to participate in the study and 51.83% response rate when we consider the companies which agreed to participate.

A comparison between companies which had provided a response and those that had not done so yielded no significant differences in relation to turnover, total assets or the number of employees, which suggests that non-response bias does not constitute a significant problem (Armstrong & Overton, 1977).

The second stage in the data collection process within this research was conducted six years after the completion of the first phase. For approximately two months, between January and February 2014, the same companies that had completed the survey six years earlier were contacted by the researcher. A survey was conducted and a total of 87 responses were collected, for a response rate of 15.53% of the total.

**Measures**

Churchill’s (1979) approach to questionnaire development was used. Scales were combined from several other relevant empirical studies with new items to make an initial list of 19 items distributed as follows: 4x3=12 of these measuring knowledge management processes, 3 focused on measurement of environmental knowledge and 4 items measuring organisational performance. The survey was initially validated by academics with expertise in organisational learning from Universities of Murcia and Cartagena (Spain) during the period of June – July 2008.

A series of telephone interviews were then conducted involving managers from a pilot sample of 2 leading Spanish hotels. These respondents were asked to indicate the reasons why they implement
environmental initiatives. All responses were related to economic reasons, e.g. conservation of materials or energy, adherence to industry codes or legislative requirements, decreased costs, process and product innovation. In fact, such initiatives were being used by businesses as communication tools to demonstrate their commitment to preventing issues which could have a negative impact on the environment. As a result of this pre-testing, we made some minor modifications based on the suggestions received. Specific issues relating to the development of the questionnaire and its related constructs are elaborated on below (see Appendix for a list of items).

- The final measures relating to the existence of knowledge management processes consisted of 4 items adapted from a scale designed by Lee and Choi (2003) to measure the constructs of knowledge socialisation, externalisation, combination and internalisation. Consistent with the findings of Lee and Choi (2003), items that addressed knowledge socialisation were interwoven with issues related to encouraging individuals in the organisation to track changing markets and share market intelligence with external agents. Also consistent with Lee and Choi’s (2003) findings, items that addressed knowledge externalisation were interwoven with issues related to the encouragement of selected individuals in the organisation to transform their tacit knowledge of customers or experts into easily understandable forms. Knowledge combination items described the process of formalising and storing concepts into a knowledge system, such as databases and knowledge bases so that reconfiguration of existing information through sorting, adding, combining, and categorising explicit knowledge could be used to create new knowledge. Knowledge internalisation items were focused on the use of knowledge about environmental issues to develop plans and to the implementation of such plans.

- Previous studies by Boiral (2002) provide guidance in developing items to measure environmental knowledge. The importance of ‘environmental knowledge’ to cognitively diverse teams relates to enhancement of technical, administrative and social strategies through the accurate understanding of the information available to groups and where such information is located in relation to environmental initiatives. This acknowledges the importance of supporting policies, rules, reporting structures and decision-making protocols that encourage the introduction of clean technologies and approaches to reduce pollution that often leads to substantial savings of materials and energy.

- As the use of objective measures may pose some challenges to researchers while making causal inference from the historical data (March & Sutton, 1997), this study adopts subjective measures to achieve a more comprehensive evaluation of performance of the firm. In this
regard, several measures of business performance have appeared in literature and we adopt the growth-based measures proposed by Kaplan and Norton (1992), and Klassen and McLaughlin (1999) for sales, profits and profitability on total assets.

Data analysis
This study uses PLS-Graph software version 03.00 Build 1058 (Chin, 2003) to conduct an analysis of the data collected. Using PLS involves following a two-stage approach (Barclay et al., 1995). The first step requires the assessment of the measurement model. This allows the relationships between the observable variables and theoretical concepts to be specified. This analysis is performed in relation to the attributes of individual item reliability, construct reliability, average variance extracted (AVE), and discriminant validity of the indicators of latent variables. In the second step, the structural model is evaluated. The objective of this is to test the extent to which the causal relationships specified by the proposed model are consistent with the available data. For hypothesis testing, we used the bootstrapping procedure recommended by Chin (1998).

In order to analyse the relationships between the different constructs and their indicators, we adopted the latent model perspective in which the latent variable is understood to be the cause of the indicators. We therefore refer to reflective indicators for first-order constructs or dimensions. Three constructs in the model are operationalised as first-order reflective constructs (i.e. environmental knowledge 2008, environmental knowledge 2014 and business performance 2014), while knowledge management practices on 2008 (SECI 08) and knowledge management practices on 2014 (SECI 14) are modelled as second-order reflective constructs. With regard to the measurement model, we began by assessing the individual item reliability (Table 1). The indicators exceed the accepted threshold of 0.7 for each factor loading (Carmines & Zeller, 1979).
From an examination of the results shown in Table 2 we can argue that all of the constructs are reliable. The values for both the Cronbach’s alpha coefficient and composite reliability are greater than the 0.7 required in the early stages of research and the stricter value of 0.8 for basic research (Nunnally, 1978). The AVE should be greater than 0.5. Meaning that 50% or more variance of the indicators should be accounted for (Fornell & Larcker, 1981). All the constructs of our model exceed this condition (Table 2). To assess the discriminant validity, we compared the square root of the AVE (the diagonal in Table 2) with the correlations between constructs (the off-diagonal elements in Table 2). On average, each construct relates more strongly to its own measures than to others.

As noted above, a second-order confirmatory factor analysis was conducted of a model depicting the constructs of knowledge socialisation, externalisation, combination and internalisation. From an examination of the results shown in Table 3 and Table 4, all first-order and second-order factor loadings were significant. In addition to this, all the knowledge creation constructs involving two organisations (i.e. SECI 08 and SECI 14) explain a high amount of variance in their respective knowledge processes (i.e. socialisation, externalisation, combination and internalisation), thereby providing evidence that SECI 2008 and SECI 2014 are multifaceted constructs, construed from four dimensions (i.e. socialisation, externalisation, combination and internalisation).
RESULTS

The structural model resulting from the PLS analysis is summarised in Table 5, where the variance of endogenous variables (R2) and the standardised path coefficients (β) are shown. As it can be noticed, all the hypothesised relationships have shown to be significant, and therefore, the hypotheses leading this research have been confirmed to be valid. Since PLS makes no distributional assumptions in its parameter estimation, traditional parameter-based techniques for significance testing and modelling were used for this study (Chin, 1998). One significant consequence of the comparison between covariance structure analysis modelling approaches and PLS is that no proper overall goodness-of-fit measures exist for models using the latter (Hulland, 1999).
The structural model is evaluated by examining the $R^2$ values and the size of the structural path coefficients. Adopting the approach used by Tippins and Sohi (2003), we looked for the presence of the mediating effect by comparing the direct effect between variables and the competing links where the mediated variable is inserted, whereby two significant links are estimated and evaluated in a search for significant differences. Table 5 shows the results of the two competing links. The proportion variance explained in ‘BP 14’ was 42 per cent. With regard to hypothesis H1, the influence of ‘SECI 08’ on ‘EK 08’ was evident ($\beta = 0.71, p < 0.001$).

With regard to hypothesis H2, we explored the presence of a mediating effect by comparing the relationship between ‘EK 08’ and ‘EK 14’, as well as the competing link where ‘SECI 14’ is included. Table 5 shows the results of these two competing links. The first link (direct effect) examined the direct relationship between ‘EK 08’ and ‘EK 14’, whilst the second link (partial mediation) examined the same relationship with ‘SECI 2014’ by acting as a mediator. The results of the partial mediation link support our hypothesis. Firstly, the partial mediation model explains more variance in ‘EK 14’ than the direct effect model (0.79 vs. 0.75). Secondly, positive relationships exist between ‘EK 08’ and ‘SECI 2014’ ($\beta = 0.63, p < 0.001$) and between ‘SECI 2014’ and ‘EK 14’ ($\beta = 0.18, p < 0.05$). Finally, the significant relationship between ‘EK 08’ and ‘EK 14’in the direct effect model ($\beta = 0.86, p < 0.001$) diminishes in the partial mediation model ($\beta = 0.69, p < 0.001$). We also estimated the ratio $F^2$ suggested by Chin (1998), to understand the significance of the improvement of the partial mediation model over the direct effect model, whereby such an improvement is considered significant in those cases where $F^2$ is greater than 0.02. In our study, $F^2$ was found to be 0.19, and therefore we conclude that there has been a significant improvement. Together, these three areas provide significant evidence that there is a discernible mediating effect of ‘SECI 2014’ and that the partial mediation model represents a significant improvement over the direct effect model. With regard to hypothesis H3, the effects of ‘EK 14’ on ‘BP 14’ were fully verified ($\beta = 0.64, p < 0.001$). Consequently, the findings provided full support for H1, H2 and H3.

DISCUSSION

The first contribution made by this research is the questioning of the existing models of the relationship between knowledge management processes and environmental knowledge over time. In doing so, the authors have included time as a variable in the analysis and, have focused on the need to create environmental knowledge at a given time (T) in order for a more efficient learning to take place at a later time (T+6). The concept of knowledge management processes was explored by studying the processes behind the organisational knowledge creation construct (i.e. socialisation, externalisation, combination, and internalisation) and then studying its impact on environmental knowledge. In summary, a null hypothesis [that environmental knowledge at a given time T is a prior step in the SECI program at a later point in time (T+6)] was tested against the alternative hypothesis [that environmental knowledge at time (T) is not a required prior step in the implementation of knowledge management processes] through an empirical study of 87 companies in the Spanish hospitality sector through PLS.

The second contribution of this research is derived from the results of testing the hypotheses in a real context. Environmental knowledge at time (T) is found to be significant in predicting the knowledge management processes. The managerial implications of the relationships observed between the factors that constitute the conceptual framework shown in Figure 1 are discussed in more detail below.

The analysis of the data collected provided full support for H1: (SECI 08 → EK 08). This finding corroborates the notion that specific knowledge management processes have to be used to create environmental knowledge and thereby contribute to its dissemination and retention within a company (Boiral, 2009). A possible explanation for the significance of such an effect may be related to the fact that before environmental knowledge can be created specific assumptions should be established and shared. Otherwise, only a few individuals within the organisation will have access to this relevant knowledge, which in turn may lead to the under-utilisation of relevant knowledge or the utilisation of knowledge which is not relevant, both of which cases are likely to lead to a degradation of environmental knowledge (Cegarra et al., 2013). One interpretation of this relationship is that through the knowledge management processes, a company can allow individuals to adjust their mental models and the nature of their assumptions to highlight some of the environmental issues and concerns that may have a direct effect on the entire company, its operation and results.

Regarding H2, the results support the position that if the organisation considers establishing an environmental knowledge at a given point in time, then this knowledge is likely to have a positive influence on the conditions that stimulate knowledge management processes for the creation of new environmental knowledge in the future, which may have a significant impact on the organisation and
its performance. A possible explanation for this result would be the fact that reusing prior environmental knowledge puts the upcoming knowledge management processes into a familiar context for members of the organisation. In other words, knowledge management processes provide a path which activates environmental knowledge which was previously created. We believe that this is an important finding which provides the basis for a hotel to develop, as such a development relies on the hotel’s ability to reuse and update the relevant knowledge of its workforce.

However, many hotel managers are cutting back on knowledge management programs by simply using prior environmental knowledge instead of implementing more innovative programs which are supported by knowledge of new environmental challenges (Aggeri, 1999). If this is the case it is possible that hotel managers are over-investing in the exploitation of prior environmental knowledge, and under-investing in (or underestimating the value of) mechanisms and aspects to develop and update existing environmental knowledge. This confirms the position adopted by Cegarra and Martinez (2010) when they argued that the use of environmental knowledge also needs to involve changes in the organisational knowledge structures. One way of doing this would be for senior management to set up a knowledge management program to embrace change and encourage new ideas and insights, which often lead to the creation of environmental knowledge. Our results show that a knowledge management program is a required step for the enhancement of environmental knowledge. In this respect, socialisation, externalisation, combination, and internalisation processes can be viewed as a mechanism for improving environmental knowledge as this may involve a process of replacing existing outdated environmental knowledge with new knowledge structures. SECI 14 enhances the effectiveness and efficiency of EK 08 which potentially leads to improved EK 14.

Regarding H3 (EK 14 → BP 14), the results support the position that, in order to improve the performance of business operations, companies need to provide and support updated environmental knowledge. These findings are important in the ongoing debate surrounding the relationship between environmental knowledge and business performance, and reinforce the views that environmental knowledge may lead to increased company benefits (e.g. Rondinelli & Vastag 2000; Zhang et al., 2000). A possible explanation for these findings is determined by the fact that when information or knowledge is updated and is not fragmented within a company, customer feedback is easy to obtain and, as a result, performance improves. As Erdogana and Baris (2007) noted, environmental knowledge will lead to a reduced consumption of energy, water, and materials, thus improving organisational performance. Thus, the easy retrieval of environmental knowledge is a critical aspect in responding to the growing customer demand for environmentally friendly programs and hence improving organisational performance (Bohdanowicz, 2005).
Managerial implications

There are different methods for managing environmental issues. However, companies still show some resistance to change their current environmental programs. The general notion among many businesses is that once they have an environmental program in place, they should not change it. The results from this study contradict such a view. As competition intensifies and the pace of change accelerates, aspects of environmental knowledge (e.g., routines and procedures) are likely to change over time, requiring the modification of some of the contents of this knowledge. Our findings support the need for managers to become more aware of the need to consider time when they drive the conditions and/or context where environmental knowledge can be exploited to increase company benefits such as cost savings resulting from eco-efficiency. Time appears to be an interesting variable to understand how environmental knowledge emerges and how it can be updated to improve an organisation and its performance. With this notion in mind, we argue that traditional concepts of managing and leading change based on knowledge management processes need to consider methods which aim at deepening participation or immersion in the immediacy of the temporal flow.

CONCLUSIONS

The above findings suggest that the creation of environmental knowledge is an important factor for organisations to become competitive, but it is not sufficient for them to maintain such a competitive advantage over time. We would further observe that the creation of environmental knowledge strongly depends on environmental knowledge which was previously created and the previous implementation of a knowledge management program facilitating socialisation, externalisation, combination, and internalisation. Through this program, individuals will be able to update their mental models by focusing their efforts on problems that are more important for the organisation and its customers, which in turn facilitates the retrieval of prior environmental knowledge.

This study has some limitations. First, national cultural issues might influence the way organisations create and update environmental knowledge. Therefore, it would be interesting to extend the study to other countries, since national cultural issues might influence the results. Secondly, this study relies on the assumption that the CEO or general director of each of the organisation possesses key knowledge of the company and therefore our emphasis here is on finding commonalities among firms in terms of the critical knowledge areas they consider important and had access to. Although this subjective information is commonly used in studies (Glaister et al., 2008), future research using more than one individual who hold key knowledge within a firm (including managers, employees and even customers) will be a useful mechanism for the study to improve the internal validity of the SECI model and environmental knowledge. Thirdly, we would consider a further research into how other
organisational factors (e.g. organisations’ size and agility) which have not been included in this study are likely to affect the performance of the firm. Therefore, future research should investigate the potential links between different initiatives such as reducing waste production and resource and energy consumption by controlling and improving lighting, heating, ventilation, air conditioning, and water use, by making proper purchasing decisions on containers, use of returnable containers and recycling materials and the company goals. Finally, it may also be interesting to observe the change in the performance of companies after adopting environmental activities, through future case studies.

IMPLEMENTATION OF INNOVATION NETWORK: A CASE STUDY OF BIOTECH INDUSTRY IN CAMPANIA REGION

Matricano, Diego; Sorrentino, Mario
Department of Management, Second University of Naples, Italy

ABSTRACT
In order to achieve the economic and social development of specific contexts, entrepreneurial scholars suggest to leverage on the innovations networks that can be inspired by the triple helix model involving university-government-industry. The theoretical studies concerning this model have been addressed according to three main paths of research: the structure of innovation networks and the linkages established inside them; the external context; and the advantages and disadvantages deriving from being part of innovation networks.

The analysis of these three paths of research is useful to develop the case study of Campania Bioscience, an innovation network created in Campania, a Region in southern Italy, whose main goal is to create a system supporting innovation, research and competitiveness in the biotech industry.

The final aim of the paper is to verify if the theoretical results deriving from entrepreneurial literature have been considered when implementing Campania Bioscience.

Keywords: innovation network; triple helix model; university-government-industry; economic development; entrepreneurial university

INTRODUCTION
Generally speaking, policy makers are interested in defining and implementing specific actions and tools in order to support innovative processes and to achieve two main goals: to create wealth and occupation. Nowadays, in particular, policy makers are more and more interested in implementing innovation networks that are inspired by the triple helix model (involving university-government-industry) and that aim to:

- Achieve the economic development and growth of specific contexts;
- Exploit the innovations resulting from R&D activities carried out in the universities through the commercialization of new materials, new products or new processes;
- Support the small and medium enterprises (SMEs), which usually do not carry out research activities and risk to loose the market competition, by offering innovations to be exploited.
Implementation of innovation networks able to achieve the development of a context (the main goal of governments) by matching demand (by industries) and supply (by universities) of results of R&D activities is the main focus of the present paper. More precisely, the present paper tries to highlight the theoretical aspects concerning innovation networks and to verify if they have been considered and implemented in the biotech innovation network promoted by Campania Region, in the Southern Italy, and named “Distretto ad Alta Tecnologia Campania Bioscience”.

The present work is structured as it follows. In the following section, the concept of innovation network is presented and discussed. In particular, the passage from the closed innovation model to the open innovation model is underlined. After that, specific aspects of the innovation network are examined. In section three, after recalling the triple helix model involving university-government-industry, attention is paid to the structure that innovation networks can assume. In section four, attention is paid to the context in which innovation network can be settled. As known, synergies between university-government-industry are stronger if the subjects are geographically close. Then, in section five, since the innovation process assumes specific characteristics that cannot be generalized, attention is paid to the advantages and disadvantages that can derive from being part of a network. The theoretical aspects are instrumental to develop the case study of Campania Bioscience, an innovation network whose main goal is to create a system supporting innovation, research and competitiveness in the biotech industry by creating and developing strong collaborations between universities and industries (section six). Reflections on the start-of-the-art and on the possible implications evolutions of Campania Bioscience are included in the last section.

**INNOVATION NETWORK**

Nowadays, enterprises are moving from a closed innovation model, according to which innovation is secretly developed inside the enterprise itself, to an open innovation model, according to which innovations result from an exchange of knowledge and competences with external subjects who are part of their network (Aldrich and Zimmer, 1986; Dubini and Aldrich, 1991; Uzzi, 1997; Baum et al., 2000; Alvarez and Busenitz, 2001). The networks created in order to achieve the above goal are properly named innovation networks.

Even if the origins of this concept can be dated back to Nineties (Freeman, 1991; Lundgren, 1995; Osborn and Hagedoorn, 1997), recent contributions have tried to point out the main characteristics of innovation networks. According to Rycroft and Kash (2004), for example, “the innovation network is organized around constant learning. It is a set of linked organizations that create, acquire, and integrate the diverse knowledge and skills required to create and bring to the market complex technologies”. In the above case, the most important aspect that scholars try to underline is the constant learning by enterprises.
Very recent contributions, instead, have highlighted other aspects of the innovation network. Arranz and de Arroyabe (2012) maintain that “the innovation network is a socio-technical system formed by three interdependent subsystems: process, structure and governance” and so they highlight three aspects (process, structures and governance) that characterize each innovation network. According to Corsaro et al. (2012), instead, “the innovation network is the configuration of strategic entrepreneurial nets aimed at improving the effectiveness of innovation performance”. In this last case, the most important aspect of an innovation network is the final goal to achieve. Despite the differences emerging from the above definitions, innovation networks can be defined as a group of subjects involved in technology transfer processes useful to share resources (mainly intangible ones, like knowledge or competences) in order to support and to foster innovative processes (Powell et al., 1996) and to foster the discovery of new entrepreneurial opportunities (Matricano, 2011). According to the above definition, innovation networks are very relevant in science-based industries (Hagedoorn, 1993, 2002), like ICT, nanotechnologies, and biotechnologies (Sorrentino, 2009).

Since it is not easy to study an innovation network as a whole, because of the peculiarities of each network and of each industry they are in, three main paths of research that have been addressed. They deal with:
- The structure of innovation networks and the linkages established inside them;
- The external context;
- The advantages and disadvantages deriving from being part of innovation networks.

These three paths of research are revised and debated in the following sections in order to try to point out their main characteristics.

THE STRUCTURE OF INNOVATION NETWORKS

Before analyzing the structure that innovation networks can assume, it is necessary to start from a deep change that universities are facing (Chiesa and Piccalunga, 2000; Etzkowitz et al., 2000; Shane, 2004; Bramwell and Wolfe, 2008). Nowadays, universities are not only involved in research and educational activities but they try to achieve their third mission (Etzkowitz and Leydesdorff, 1999, 2000; Etzkowitz et al., 2000; Etzkowitz, 2003) consisting in the exploitation of the results of R&D activities in order to support the economic development of the context they are in (Johnson, 2008). Enterprises have accepted this change and, above all, they are trying to leverage on the results of R&D activities carried out by universities: high salaries, high entry barriers, and instability in the market competition are driving enterprises to ask for innovations and universities seem to be able to supply them. To match demand (by industries) and supply (by universities) of results of R&D activities is not
an easy task. This is the reason why governments (meant both at a national and at a regional level) play a crucial role in achieving this task.

Based on the close relationships between universities and industries and on the relevance that governments assume in implementing and supporting these relationships, the *triple helix model* comes out (Etzkowitz *et al.*, 2000). From a theoretical perspective, the convergence of universities’, industries’ and governments’ aims is easy to understand. From a practical perspective, instead, implementation of specific actions is more complex. Governments, in fact, have to:

- Drive academic R&D activities towards results exploitable by industries;
- Promote the achieved results in order to inform enterprises about the existence of exploitable results;
- Manage the exchanges between universities and industries and to match demand and supply.

Even if it is clear who are the subjects involved, it is not possible to clarify any typical structure of innovation networks (Pittaway *et al.*, 2004; Salavisa *et al.*, 2012). As noted by Ricciardi (2006), in fact, each innovation network assumes the structure most fitting with the established results. Thus, no generalization is allowed. However, it seems possible to find out some key aspects that can give information about the structure of innovation networks. According to Ricciardi (2006), there are two key aspects concerning: the relevance of the subjects and the evolving structure over time.

As for the former, it is important to define whether the subjects promote the innovation network or if they decide to join an already existing one. If they are the promoters, they are expected to be more involved and to occupy the centre of the network itself. Thus, they can shape the network according to their needs. On the contrary, if the subjects join an already existing network, they do no have the possibility to shape it and so they can only accept the structure as it is. As for the latter, it is important to notice that innovation networks are supposed to last even if their structure can change. The possibility that new members can join it or that old members can leave it necessarily implies that the structure of the innovation network can be modified and, by consequence, it implies the impossibility of any generalization about it.

Another approach (Salavisa *et al.*, 2012), instead, identifies four key aspects that can determine the structure of innovation networks:

- Size: since enterprises enter or create innovation network in order to get resources they do not have, the higher is the number of subjects involved, the higher is the chance to obtain additional resources (Burt, 2000). It means that enterprises try to involve other subjects by modifying the structure of the innovation network they are in;
- Type: when subjects involved carry out similar activities, there can be a problem of redundancy (Burt, 1992); on the contrary, when subjects involved carry out dissimilar
activities, new resources are easily obtained (Baum et al., 2000). There is a continuous search of subjects to be in contact with and so the structure can be modified;

- Positioning: relational position makes the exchange of resources much easier and this is a very important aspect to be considered in innovation networks (Powell et al., 1999). Subjects in innovation networks try to get closer to the centre since and so possible changes in the structure can derive;

- Links: kind, content and frequency of links determine the possible structure of innovation networks. The decision to leverage on strong or weak ties (Granovetter, 1973, 1985), on formal or informal ones (Birley, 1985), on additional or redundant ones (Burt, 1992, 2000), on direct or indirect ones (Podolny and Baron, 1997; Ahuja, 2000) affect the structure of innovation network and make it impossible to generalize it.

According to the above contributions (Ricciardi, 2006; Salavisa et al., 2012), it is possible to generalize neither the structure of an archetypal innovation networks nor the structure of a specific innovation network since it can always change in both the cases.

THE EXTERNAL CONTEXT

The external context plays a very important role in technology transfer processes, determining the success or failure of innovation networks (Bramwell and Wolfe, 2008; Dell’Anno, 2010). Some contexts, meant as geographical contexts, can be considered as knowledge innovation zones where it is possible to establish very strong connections and to stimulate new entrepreneurial activities. In particular, this can be due to the spillover effect and to technological brokers.

The spillover effect, which can be defined as a positive externality that a subject involved in R&D activities can get from the results of R&D activities carried out by others, is much stronger if the source and the recipient of knowledge are geographically close (Dell’Anno, 2010). This is particularly true when the transfer processes concern tacit knowledge that is not formalized. Of course, if the transfer process concerns codified knowledge, for example through patents citations, geographical proximity is not so relevant.

As already anticipated, technological brokers play an important role in innovation networks and so they can affect the success or failure of innovation networks. Efficacy in technology transfer processes depends on the competences and on the skills that dedicated offices have – these offices are properly named technology transfer offices or industrial liaison offices. They deal with the commercialization of research results and, in particular, they deal with the facilitation of internal and external information flows and the definition of incentives (Phan and Siegel, 2006).
In contexts where the spillover effect is greater and where technological brokers are more efficient, innovation networks are more expected to achieve the established results.

THE ADVANTAGES AND DISADVANTAGES DERIVING FROM BEING PART OF INNOVATION NETWORKS

As noted by several scholars (Ahuja, 2000; Dhanaraj and Parkhe, 2006; Gardet and Mothe, 2011), empirical studies able to describe and to analyze technology transfer process are very rare because of the so many difficulties to be faced. For this reason, scholars have paid more attention to the advantages and disadvantages deriving from being part of innovation networks (Ricciardi, 2006). The main advantages deal with: knowledge transfer, distinctive competences, financial resources, and exploitation of innovations. The main disadvantages, instead, deal with: opportunistic behavior and asymmetric contributions and different aims.

The first advantage is related to easiness in transfers of tacit knowledge. The fact of being part of the same innovation network suggests assuming that all the subjects involved have already developed the absorptive capacity (Cohen and Levinthal, 1990), i.e. the ability to apprehend knowledge transmitted by others. This happens because of the specific knowledge that subjects have accumulated in the past. Of course, the exchanges implemented in the innovation networks reinforce the absorptive capacity. The second advantage is linked to distinctive competences that can be developed. As noted by Parente (2008), enterprises can develop integrative competences (in order to mix internal and external knowledge), coordinative capabilities (able to synchronize new acquired knowledge) and generative capabilities (through which new knowledge is created). The third advantage reveals itself in reference to funding and to economies of scale and of learning, which derive from sharing the costs of R&D activities. Finally, the last advantage consists in the straight exploitation of technological innovations.

However, being part of innovation networks can cause some disadvantages as well. The first can derive from opportunistic behaviors (Williamson, 1975) that others can put into practice, both before and after the drafting of the contract ruling the partnership. This kind of disadvantage has been examined in the agency theory (Jensen and Meckling, 1976). The second disadvantage, then, can arise when the subjects involved in the network do not share the resources arranged or when they pursue different aims. In both the cases, the subjects are forced to proceed with the network activity or they could be interested in leaving the network.

Both the possible advantages and disadvantages are shown in table 1.

A CASE STUDY OF BIOTECH INDUSTRY IN CAMPANIA REGION

The results of the analysis carried out in previous sections (about the networks’ possible structure, the external context and the achievable advantages or disadvantages) are instrumental to test whether the implementation of Campania Bioscience has been properly carried out.

Since the Second University of Naples – which has funded this research project – is located in Campania Region, the choice to refer to a network implemented in the same Region sounds obvious. However, the choice of the network to refer to is not. For this reason, the choice is rooted in the entrepreneurial literature. Open innovation network are very frequent in knowledge-based industries (Hagedoorn, 1993, 2002) that mainly deal with biotech or aerospace industries in Campania Region. Between them, the most recent network implemented in the Region is related to the biotech industry and from this it derives the choice to focus on Campania Bioscience.

In order to understand the peculiarities of the biotech industry (Pisano et al., 1988; Arora and Gambardella, 1990; Powell et al., 1996; Ahuja, 2000; Baum et al., 2000; Audretsch and Feldman, 2003; Boardman, 2008), it is suitable to start from some data published in a report edited by Ernst & Young (2012) entitled “Rapporto sulle Biotecnologie in Italia - BioinItaly Report 2012”. According to the data, Italy has one of the highest amounts of biotech ventures. Across Europe, only Germany and United Kingdom show better results. Data about the distribution of the Italian biotech ventures are shown in table 2.

Table 2. DISTRIBUTION OF THE ITALIAN BIOTECH VENTURES BY REGION

<table>
<thead>
<tr>
<th>The Italian biotech ventures by Region</th>
<th>Number</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lombardia</td>
<td>129</td>
<td>32.74%</td>
</tr>
<tr>
<td>Piemonte</td>
<td>43</td>
<td>10.91%</td>
</tr>
<tr>
<td>Lazio</td>
<td>42</td>
<td>10.66%</td>
</tr>
<tr>
<td>Emilia Romagna</td>
<td>36</td>
<td>9.14%</td>
</tr>
<tr>
<td>Veneto</td>
<td>25</td>
<td>6.35%</td>
</tr>
<tr>
<td>Toscana</td>
<td>24</td>
<td>6.09%</td>
</tr>
</tbody>
</table>

Campania is at position number ten in the list and, according to specialists of the industry, it seems to be a promising context for future development of biotech industry.

The data about partnerships of Italian biotech ventures are of great interest too. While 54% out of all the biotech ventures is standing alone, 35% out of the total is located in scientific parks or in incubators, and the remaining 11% is located close to universities or research centers (table 3).

Source: “Rapporto sulle Biotecnologie in Italia - BioinItaly Report 2012”, Ernst & Young.

The above data, according to which 46% out of Italian biotech ventures is located in knowledge innovation zone, represent the starting point for the implementation of Campania Bioscience.

The project about the implementation of Campania Bioscience can be dated back to 22nd March 2011 when the feasibility study was presented. On 23rd April 2012 the Italian Ministry of University and Research (M.I.U.R.) has approved the above feasibility study and then, on 7th August 2012 the agreement between M.I.U.R. and Campania Region, properly named “Accordo di Programma Quadro”, has been signed.
All the partners involved in the network have shared the mutual-aid aim of the network so that the net gains will be reinvested in R&D activities. The social capital is nearly equal to 1.7 millions of euro (44% by research institutions, 44% by ventures, and 12% by technology transfer offices).

It is possible now to pay attention to the three paths of research presented above: the structure of the network, the context and the possible advantages/disadvantages.

As for the structure, Campania Bioscience is still *in fieri* and so it is not possible to study the possible evolutions of its structure. However, there are the three main subjects involved in the open innovation network. Campania Region has signed the agreement with M.I.U.R. and so the government plays an important role in this network. The research institutes (both universities and research centers) and the technology transfer offices involved are ten and the ventures involved are sixty-four. All the three main subject of the *triple helix model* are actively involved in the Campania Bioscience.

As for the context, the choice to involve only research institutes (both universities and research centers) and ventures that are located in Campania highlights the will to transform the Region in a *knowledge innovation zone*. Hopefully, this can support the process of *inventing around*, a process through which starting from a research result already achieved – like a patent – many other results can be achieved.

Finally, it is possible to analyze the possible advantages/disadvantages. The first advantage deals with knowledge transfer and distinctive competences (Powell *et al.*, 1996; Powell, 1998; Garraffo and Sorrentino, 2009). The heterogeneity of the subjects involved in *Campania Bioscience* – ten research institutions and sixty-four ventures – surely represents one of the main strengths. The shared competences vary across the subjects and so knowledge transfers are expected to be effective and productive. As for the economic advantages linked to be part of a network (Cunningham, 2002; Audretsch and Feldman, 2003; Pisano, 2006), the social capital of nearly 1.7 millions euro and the mutual-aid aim seem to be right promises to the proceeding of the research activities.

Of course, attention needs to be paid to the disadvantages too. Up to now, disadvantages in *Campania Bioscience* have not emerged yet mainly because the network is very recent. However, some actions in order to reduce them have been thought and implemented. All the subjects involved, in fact, have been divided into three main lines of interventions (shown in table 4). Hopefully, this should avoid the raising of disadvantages by creating small groups where the partnership should be much easier.
Table 4. **LINES OF INTERVENTION ESTABLISHED BY CAMPANIA BIOSCIENCE**

<table>
<thead>
<tr>
<th>The lines of intervention</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Line 1 – Industrial Research and Experimental Development</strong> – concerns three main fields of research:</td>
</tr>
<tr>
<td>A) Development and production of new biotech products</td>
</tr>
<tr>

</tr>
</tbody>
</table>

*Source: Report edited by Distretto ad Alta Tecnologia Campania Bioscience, 2012.*

**CONCLUSION**

As emerged from the literature review, it is not possible to define an archetypal type of innovation network. It is only possible to fix some key-aspects like the structure (and its evolution), the context and the possible advantages/disadvantages.

The present study has tried to verify if these key aspects have been considered when implementing Campania Bioscience, a biotech innovation network promoted in Campania, a Region in southern Italy. The fact that they have been taken into account seems very promising even if it seems premature to assume that these characteristics can take to long-run positive results. Very often, in fact, disadvantages can be more relevant than the expected advantages and so the ongoing of the innovation network does not seem so obvious: theoretical research can be helpful to fix some guidelines but to implement them is not so straight.

Unfortunately, Campania Bioscience is still in an embryonic phase and so it is not possible to evaluate if and to which extent the implementation of the innovation network matches the theoretical guidelines emerged above. However, by proceeding as already done – leveraging on the positive key aspects and trying to avoid the possible disadvantages – Campania Bioscience could aspire to be the driver of future economic development of Campania Region and, above all, it could legitimately aspire to be a good example of the *triple helix model*.

IMPACT OF PHENOMENON OF MONEY LAUNDERING ON MODERN GLOBAL ECONOMY

Matysiewicz, Justyna; Smyczek, Sławomir
University of Economics in Katowice, Poland

ABSTRACT
Within the last few years the structure, function and effectiveness of the market system of many countries have undergone radical transformations. Liberalization of commodity and service turnover as well as a free flow of technology, people and, above all, capital has had a stimulating effect on the development of economy of these countries. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to its money laundering. The development of the phenomenon of money laundering is mainly facilitated by differences existing between legal and financial systems of particular countries and international standards as well as by achievements of the scientific and technological revolution. The commonness of a fast and efficient information transfer combined with an unlimited possibility of global travelling brings about a situation where money laundering assumes new and more refined forms. Therefore, the harmfulness of the phenomenon can neither be treated as a one-facet problem nor considered in isolation from other elements of an economic and financial pathology. Money laundering can pose a serious threat both to individual firms and all market mechanisms on a regional and global scale. With respect to the above-presented problems, the goals of research were to define phenomenon of money laundering, its nature and evolution as well as mechanisms of its development, identification role of globalization of world economy on development the process of money laundering in the modern economy and assessment of a threat posed by the phenomenon to the functioning of firms, countries and the whole world economy.

Keywords: money laundering, determinants, global economy

INTRODUCTION
Globalization as result of expanding geographical range of interactions between different subjects of international relations has huge impact on market system in particular countries, regions and whole world. Within the last few years the structure, function and effectiveness of the market system of
many countries have undergone radical transformations. Liberalization of commodity and service turnover as well as a free flow of technology, people and, above all, capital has had a stimulating effect on the development of economy of these countries. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to it money laundering. The development of the phenomenon of money laundering is mainly facilitated by differences existing between legal and financial systems of particular countries and international standards as well as by achievements of the scientific and technological revolution. The commonness of a fast and efficient information transfer combined with an unlimited possibility of global travelling brings about a situation where money laundering assumes new and more refined forms. Therefore, the harmfulness of the phenomenon can neither be treated as a one-facet problem nor considered in isolation from other elements of an economic and financial pathology. Money laundering can pose a serious threat both to individual firms and all market mechanisms on a regional and global scale.

With respect to the above-presented problems, the goals of research were to define phenomenon of money laundering, its nature and evolution as well as mechanisms of its development, identification role of globalization of world economy on development the process of money laundering in the modern economy and assessment of a threat posed by the phenomenon to the functioning of firms, countries and the whole world economy.

Globalisation – notion and characteristics

The globalization can be also defined as a process where markets and production of different countries become more dependent on one another due to an increase in the volume of exchanged goods and services as well as due to the inflow of capital and technologies. Globalization can be perceived as a higher stage of internationalization, characterised by intense development of relations and interactions on a global scale. According to W. Anioł, nowadays, internationalization „evolves” into globalization as a result of expanding geographical range of interactions between different subjects of international relations, until it comprises the whole world. Hence, the internationalization can be treated as an initial concept of globalization. H. Chołaj describes globalization as the highest stage of internationalization, which constitutes multitude of processes and phenomena such as the international flow of goods, services, capital, technologies, information and human resources. The author also refers to it as a dominant orientation on the world’s market with respect to trade, investment and other transactions, as a territorial and institutional integration of markets and, finally, as global problem relating to ecological degradation which calls for international cooperation in providing adequate solutions (Berekoven, 1989). According to A.K. Koźmiński, in the economic sense, the main difference between the internationalization and globalization lies in their geographical range.
In case of internationalization, its range reaches several countries, whereas globalization comprises the whole global market. Internationalization is of gradable character where we can talk about less or more advanced stage of internationalization of companies, industries or the economy of a given country or region (Limanski, 2001). Globalization has mainly comprised the production and sales of modern goods which are scientifically and technologically advanced (electronic, motor or chemical industry). Globalization is most vividly demonstrated through international investments, production and inter-corporation exchange rather than through traditional foreign trade. Following the assumptions, the development of globalization will take place simultaneously with the spread of information, and therefore, the future society will be not only the society of information but, first of all, a global one (Meissener, 1991). The reasons for the acceleration of the globalization processes in the world, and especially their occurrence on a global scale, are connected with technological (technological and scientific revolution), political and socio-economic changes (Rymarczyk, 1996).

With respect to the first factor, its influence on the globalisation should be combined mainly with well-grounded interests of oligopolistic competitors and with huge investments made in research and development. Bearing the costs of investments, big corporations aim at their quick amortisation through selling which goes beyond the borders of domestic, or even neighbouring markets. The increase in sales volumes, and consequently, the extension of a production range, brings more benefits. The shortening of a product life cycle as a result of growing competition encourages countries to sell to the largest markets including the global one.

Another technological factor affecting the process of globalization relates to new inventions, mainly the Internet which facilitates and reduces the costs of transport and communication. The distance included in costs does not influence the price as much as before, and thus helps develop the international transfer of products and know-how.

The socio-economic factors, resulting from a homogenous character of consumers and their growing requirements, are also connected with technological changes. The development of transport and communication has facilitated not only the flow of goods and information, but also the movement of people whose tastes have become alike. The standardization of life styles and consumption patterns increases income levels and fosters educational development. As a result, there appear consumer groups whose buying behaviour with respect to goods and services is mainly conditioned by demoscopic or psychological factors, and not by the type of their nationality. This explains why the demand for these goods and services appear in different countries.

Another factor that has accelerated the process of globalization is the liberalization of the world trade combined with the policy of facilitating and supporting the flow of capital. This policy is advocated by
countries which send or receive the capital, and by organizations (e.g. World Bank) whose activity is crucial for supporting economic growth and for including Poland and other East-European countries in the process of globalization. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to it money laundering.

**MONEY LAUNDERING – EVOLUTION AND CHARACTERISTICS**

Money laundering appeared for the first time in the twenties of the previous century in the United States of America. The phenomenon did not appear in the course of the evolution of crimes and transgressions of economic nature, but occurred as a new type of criminal activity which evolved together with the development of modern organized crime. High proceeds from illegal business and criminal operations, as well as threats following the investigation process against Alphonse Capone\(^1\) forced the elites of the criminal world to legalize illicit funds (Bartosiak, 2003). The eighty-year-old history of money laundering, the history of an invasive character, can be divided into two stages of development. The first stage is characterized by the use of simple methods of funds legalization.\(^2\) In the second stage of its development, money laundering evolved into specialized international criminal activity organized in a regular business defined as “full-time criminals” (Lerbell, 1978).

The main direction of the phenomenon evolution has been influenced by existing correlations between:

- a) the process of transformation of small local criminal groups into organizations of a regional range, as well as the transposition of some of the groups into organizations of a distinct organizational structure,
- b) fast-developing professional methods of activity of criminal groups,
- c) new fields and areas of interest of criminal circles and new possibilities provided by ongoing geopolitical changes,
- d) achievements of the scientific-technical revolution.

The legalization of big sums of money has become a necessity for members of criminal groups, as it is the “laundered” money that can ensure the “consumption of fruits” of criminal activity and guarantees its further development. Illegal funds come from two main sources of criminal activities:

\(^1\) Al. Capone, the founder of a modern criminal organization whose activity involved corruption of politicians and police representatives, extortions, illegal gambling, and management of brothels. The gigantic annual proceeds of 60 mln dollars of that time (at present it equals about 2 billion dollars) were gained through illegal alcohol trafficking in the whole area of the State of Illinois. Al Capone was sentenced to 10 years in prison for evading tax on winnings gained in an illegal casino.

\(^2\) Al. Capone bought a chain of city laundries and introduced illegal money into the legal circulation through fictitious proceeds from fictitious services.
1) traditional activities,
2) activities which evolved with new trends, as a consequence of system transformations of Central and Eastern Europe countries and a new process of international integration within the European Union.

Traditional offences and crimes which constitute a source of illegal funds comprise:
1) All types of drug crimes.
2) Tax frauds.
3) Customs crimes.
4) Arms trading, especially nuclear materials.
5) Organized prostitution including children prostitution and procurements.
6) International terrorism and contract murders.
7) Extortions and ransoms.
8) Trading children, women and life body organs.
9) Forgery of money, securities and personal documents.
10) Theft, smuggling and fencing stolen arts, antiques and luxury items.
11) Illegal transfer of people over international borders.
12) Production and trading of illegal software and counterfeited CDs and DVDs.

The second group of crimes which have been evoked by geopolitical changes comprises:
1) Activities directly related to business and financial operations in the field of privatization being part of a system transformation of CEE countries.
2) Frauds connected with a structural policy, particularly the embezzlement of the EU funds (Jasiński, 2002).

The process of money laundering consists in the introduction of means of payment, securities or other currencies of unknown origin into the legal circulation (Pracki, 1995). The executive activities may differentiate depending on the country where the money is laundered and on the profile of criminal activity. Nevertheless, these activities are always subjected to goals which can guarantee effective legalization of financial means:
1) hiding a real source of funds and identity of their owner,
2) constant supervision and necessary safety of illegal money in the process of its legalization.
3) legalization of illegal proceeds through their introduction into the official financial system.

The process of money laundering has been based on a three-stage model (Gilmore, 1999) for the sake of a precise description of stages, characteristic features and rules of the process functioning. Thanks to this, it is possible to define the areas of operational activities of money laundering, and, above all, to
expose the weak points of the mechanism whereby the probability of identifying suspicious financial operations is bigger.

Table 1. Stages and main objectives of the process of money laundering

</table>

Source: Author’s elaboration based on Wąsowski and Wąsowski, 2001 and Bilmore, 1999.

The revealed and examined cases of the legalization of illicit funds show that the process of money laundering can be conducted with the omission of particular stages, the stages may exist simultaneously or else they may overlap (Gilmore 1999, p. 37). Nevertheless, the executive activities always demonstrate the following features:

1) Complex forms of operational activities.
2) The use of a perfect camouflage.
3) Character of participants of the process.
4) The main objective of the operation.
5) A cross-border strategy of the operation.

In view of the growing importance of globalization of the world economy, the cross-border character of the process of money laundering is gaining still more significance. The international character of money laundering is presented in Table 2.

---

1 The omission of the first stage may occur due to:
   1. Lack of possibility of purchasing financial assets: shares, bonds, banker’s and traveller’s cheques.
   2. The use of deposit services provided by banks and deposit institutions “…exceptional attractiveness of deposit institutions for criminal groups as a result of a wide range of services which give “launderers” a possibility to hide deposits and legitimize incomes, in other words, to launder money through the second and third stage.

<td><strong>A cross-border strategy of the operation</strong> pursued within the international criminal operation enables launderers to use all types of loopholes in order to facilitate the concealment of illegal funds and their origin.</td>
</tr>
</tbody>
</table>

Source: Author’s elaboration based on Lernell, 1978 and Jasiński, 2002.

The high adaptability of the process participants to new geopolitical conditions and their ability to use scientific and technological achievements contributes to the development of natural mechanisms which facilitate further evolution of money laundering.

**THE MODEL OF MONEY LAUNDERING PROCESS**

In order to precisely define the nature of particular stages of the process and existing relations between them, the model has been presented in block diagram as in Figure 1.

Figure 1. The classic process of money laundering

**Sources of origin of financial means**
Traditional crimes of primary nature.
Crimes being a consequence of new trends in organized criminal activity.

Anonymous entities participating in transactions.
Anonymous character of transactions.
Cash handling.

**Financial means appropriated for legalization**
Means of payment, securities

**Preparation of financial means**
The purifying or refining of money.
Transfer of money to the place of its allocation

The evasion of declarations or registration required for account deposits.

**Placement**
Disposal of funds gained from criminal activity
Blending legal and illegal money.
Deposits made into both fictitious and existing bank accounts.
Purchase of financial instruments.
Purchase of luxury items.
Money transfers.
Smurfing.
Purchase of foreign currencies.

Entering a system of financial disguise of money origin

Layering
Hiding the source and the owner of financial means.

The general rule of a fast money transfer.
SWIFT Society for Worldwide Interbank Financial Telecommunications.
EFT Electronic Funds Transfer.
Traditional ways of money transfers.
Purchase of financial assets such as shares, bonds, traveller’s or cashier’s cheques
Electronic transfers between accounts.
Simulation of a cash withdrawal.
Establishment of fictitious firms.
Purchase of companies in insolvency.

Return of clean money to the owner

Integration
Providing evidence of a legal character of financial means.

Transactions in tax havens.
Credit-deposit operations.
Purchase of expensive and luxury items.
Commercial transactions with foreign countries
Repayment of loans.

Source: Author’s elaboration based on Gilmore, 1999.

The process of money laundering is directly preceded by activities which aim at the adjustment of the money denomination to the most favourable value defined by one of the two procedures of further conduct:

1) The provision of funds to the place where attempts are made to introduce the funds into the banking system.

2) Placement – the first stage of the classic model of money laundering.

The provision consists in the transfer of illegal money from the place of illicit income to the place of money laundering. These are often tax havens where the focus is put on discretion and anonymity, regulations allow for cash deposits and the money exchange is not subject to monitoring. The provision is most frequently made through:
1) A physical transfer of money.
2) The change of money into luxury items which are most frequently sold at cut prices after transportation.

The main objective of activities undertaken within the first stage of money laundering, referred to as placement, is the introduction of means of payment into the financial system by virtue of three types of operations:
1) Physical deposits into accounts (transaction structuring).
2) Deposits made into accounts through smurfing (smurfing).
3) Blending legal and illegal money (blending).

Physical deposits made into accounts (a proper definition of transaction structuring) consist in making various financial operations at the stage of placement. Deposits are made into all types of accounts, including fictitious accounts of non-existent companies, organizations and natural persons. This method, however, is restricted by the obligation to identify the ordering party of an operation and to register transactions over the equivalent value of 15,000 euros. In order to evade the obligation, combined transactions are used, where series of deposits below a certain regulatory cash limit are made into definite accounts. Thus, the accumulated funds are wired into collective accounts (Kowalski, 2001).

“Smurfing” is a form of a physical deposit and constitutes one of the safest, the most developed and the best organized technique of money laundering. It is also the most difficult to divulge, but at the same time very laborious and time-consuming. The method is used on all continents, especially in Asia and Europe. “Smurfing” involves splitting and distributing illicit money among “smurfs” who either pay the money into bank accounts below some limit sum or buy traveller’s cheques.

“Blending”, in other words mixing illicit money with legal funds, constitutes the oldest and the simplest method of money laundering at the placement stage. The blending of financial means is performed within three methods:
1) Supporting criminal activity.
2) Company takeovers.
3) Cooperation defined by terms and provisions stipulated in the agreement between the management of a company and leaders of a criminal group.

The method of blending illicit funds with legal proceeds of service companies, where cash flow (turnover) is very big and its volume is hard to estimate by law enforcement agencies, is defined as “supporting criminal activity”. If a company belongs to a criminal organization, it serves an extra function of an official place of employment for members of such an organization. The history of money laundering has witnessed cases where contracts were signed between owners of companies...
and organizers of the process of money laundering. Such indicative data as high turnovers and due settlement of VAT and income taxes have made the procedure extremely safe. Only sudden appearance of big volume turnovers, which are incompatible with the company’s size and potential, and an in-depth analysis of the company’s business activity may raise some suspicions which are, however, extremely difficult to confirm (Czajkowski, 2002).

The main objective of undertaken activities within the second stage of money laundering, referred to as layering, is the separation of funds from a source of their origin. This is achieved through various fast banking operations. The duration and number of performed transactions are subjective and launderers must be absolutely sure that the establishment of a real source of money origin is not feasible. In order to achieve this, the following methods are employed:

1. Fast transfers with the use of electronic tools:
   a) SWIFT (Society for Worldwide Interbank Financial Telecommunication),
   b) EFT (Electronic Funds Transfer) and traditional methods of money transfer.
2. The purchase of financial assets and the change of their form.
3. Setting up fictitious companies - even for one financial transaction.

Very fast performance of electronic orders and easy access to SWIFT and EFT make these tools perfect for layering interdepartmental, inter-bank and international operations with a simultaneous change of their name and owner (Wójcik, 2002).

Another method of money laundering at the stage of layering involves the purchase of financial assets which could not be bought in the previous stage. In this case the separation of illicit funds from their source occurs at the moment of purchase or during the change of a deposit form. Every restructuring of invested capital poses a threat of capital loss or its value change. The process of money laundering also employs a method which involves setting up fictitious companies or saving insolvent businesses whose accounts are used to conduct previously discussed activities (Zadworny, 2002).

The main objective of activities at the stage of integration is to legitimize both the criminals’ wealth and their high incomes. This is achieved through the introduction of both illegal and legal money into the joint circulation by means of the following methods:

1) Purchase and sale of luxury items and tangibles.
2) Repayment of loans.
3) Saving companies in bankruptcy.
4) Foreign trade transactions and transactions using transfer prices.
5) Credit-deposit activity (Gilmore, 1999).
The mechanism of money laundering through the purchase and sale of luxury items and tangible assets below the market price works in the following way: the payment of financial liabilities resulted from the purchase is effected from two sources:

1) the legal source with respect to the official price defined by the purchase-sale agreement.
2) the illegal source, with respect to the difference between the market price and the prices stipulated in the agreement (Fijalek, 2001).

The sale legalizes and justifies the profit. The method engages all kinds of real estate agencies as well as companies involved in selling means of transport, even without their knowledge of the game which they are part of. The repayment of loans with illicit funds is another method of money laundering at the stage of integration. The means obtained from the loan are proved legal, whereas the repayment is effected with funds from secret sources. The method is extremely effective and difficult to reveal, particularly when institutions applying for a loan are managed or controlled by criminal groups.

Another technique of money laundering at the integration stage consists in the introduction of financial means from a criminal activity into an insolvent company with an apparent intention of saving it. The procedure is facilitated by some attitudes of managers who are in charge of an insolvent company or its assets. They usually do not scrutinize the origin of saving funds, or else deliberately enable their legalization (Zadworny, 2002).

Some other methods of money laundering at the integration stage comprise international commercial transactions which use:

1) Double sources of import financing.
2) Manipulative changes of prices of imported goods.
3) Deliberate and planned lack of correspondence of a declared value and volume of imported goods to the market price and volume of goods delivered by the exporter (Matusz, 2002).

Such actions allow for the manipulation of customs duties whose lowered value is a decisive factor during the identification of suspicious transactions.

The technique of a double source of financing involves the introduction of illegal money into the circulation at the stage of payment for imported goods. This is performed by means of two sources of money:

1) The legal source, used to pay for imported goods at reduced prices according to invoices.
2) The illegal source, used to pay the difference resulted from a real value of imported goods and the legal payment (Kęsicka, 1993).

The method of transfer price manipulation is based on a deliberate change of the price value and most frequently constitutes one of the elements of wider-range criminal activities. The planned change of transfer prices and the use of differences in particular areas of taxation, which are obligatory for
both importers and exporters, lead to the development of informal financial relations between institutions participating in the process. The relations are of informal and mutual character, and their existence is known exclusively to the authors of the process. All this ensures an increase of the value of illegitimate money transfer by means of higher and lower taxation within:

1) Mutual provision of fictitious services.
2) Fictitious complaints concerning quality of a product or service.
3) Licence fees (Matusz, 2002).

The credit-deposit method of funds legalization at the stage of integration involves the use of illicit money as long-term deposits or low-interest loans. Illegal money deposited mainly with foreign banks in the form of long-term deposits constitutes a perfect security or a source of repayment of a loan granted mostly in a home country. The second element of the strategy comprises granting long-term and low-interest loans either by institutions participating in money laundering or directly by criminal groups. The borrowers are companies which have been denied credit facilities by other banks due to lack of credibility with respect to sources of loan repayment and to their financial and economic standing.

Money laundering is a process comprising a series of financial activities undertaken by the same “work group” and for the same reasons, expressed through repeated correlations and producing definite socio-economic results. The authors of the process are top specialists in banking and vast areas of law who aim at creating more effective and better concealed methods of money legalization. Hence, it can be presumed that there exist other, so-far undiscovered methods reaching beyond the popular techniques of money laundering.

**FACTORS STIMULATING THE PROCESS OF MONEY LAUNDERING**

The development of the international process of money laundering as a specialized area of organized criminal activity is fostered by the following factors:

1) Different legal and financial systems of states or state unions.
2) The role of progress being a result of the scientific-technical revolution initiated in the second half of the previous century.

Differences between financial and legal systems of countries and international standards are the most significant factor stimulating the process of money laundering. The differences refer to four areas of the systems:

1) Competition – liberalization of regulations with respect to tax and banking law through implementation of governmental programmes concerning the creation of favourable conditions for entrepreneurship.
2) Legislation – lack of uniform international legal and financial standards with respect to what is banned and what is allowed in a country.

3) Prevention – lack of international cooperation of specialized national law enforcement agencies with respect to continuation of prosecution of transgressions and crimes committed abroad.

4) Jurisdiction – the application of the principle of territory, which hinders effective adjudication also with respect to some organized crime including money laundering (Bojarski, 2001).

The deliberate exploitation of the above-presented differences by state governments contributes to the creation of tax havens whose numerous sophisticated legal and economic mechanisms open the way to the development of private enterprises. The liberalization of tax regulations and lack of bureaucratic management barriers attract foreign investors who foster economic development through commercial and investment operations. All this leads to the establishment of agencies of specialized law and auditing companies, as well as world banks and insurance companies. The agencies, which represent transnational organizations managing multibillion deposits, offer the most sophisticated financial services and, at the same time, ensure total anonymity of participants of banking operations and discretion of conducted transactions. The nineties of the 20th century witnessed the greatest boom of tax havens. Business operations which intend to open their activity in tax havens or are already present on their territory are offered competences such as:

1) Tax savings - people who run their own legal business can be relieved from any forms of taxation.

2) Discretion and anonymity - most institutions rendering financial services conform to the legal norm according to which any disclosure of information about owners of a company is deemed a penal act.

3) Protection of assets - majority of jurisdictions of tax havens has many legal norms protecting company assets or owners. Any court executions or verdicts passed by organs of other jurisdictions are subject to objection (Niklewicz, 2002).

Whatever their geographical locations, tax haven share the same characteristic features.
Table 3. Features of tax haven share

<tbody>
<tr>
<td>Liberalization of banking law</td>
<td>Liberal regulations with respect to the banking law enable anonymous bank account openings. Banks of Luxemburg, for example, accept cash deposits without asking any questions, which is unthinkable in other countries of the European Union. The authorities argue that similar regulations are obligatory in the competitive Switzerland, and as long as they are in force there, Luxemburg will not change its own regulations.</td>
</tr>
<tr>
<td>The change of interest taxation into fees and taxes of a symbolic value.</td>
<td>Tax savings are a consequence of the following facilities: 1. Payment of small administrative charges. 2. The change of all kinds of interest taxes such as profit tax, capital tax, capital transfer tax, inheritance or vat tax into lump-sum tax.</td>
</tr>
<tr>
<td>Strict banking secrecy</td>
<td>Within the cooperation with the judiciary, the disclosure of the banking secret is restricted; the secret can be revealed in the case of the most serious crimes.</td>
</tr>
<tr>
<td>The guarantee of security</td>
<td>Tax havens are located in areas which are free of military operations and in the vicinity of big markets. They are characterized by great economic and political stability of an economic region or a country.</td>
</tr>
<tr>
<td>Excellent technical facilities</td>
<td>Excellent technical facilities enable to carry our transactions by means of the most advanced tools. Tax havens have excellent transport infrastructure including air connections with the most strategic places of the world.</td>
</tr>
<tr>
<td>Favourable law regulations for launderers of dirty money</td>
<td>The law regulations are so designed as to protect and obtain capital. The authorities consciously allow for regulations conducive to money laundering. In 1962 president Charles de Gaulle threatened to deprive Monaco of water and electricity and imposed customs union on the principality. In 2000 Monaco was threatened again with legal sanctions by the French Ministry of Finance.</td>

Source: Author’s elaboration based on Wąsowski and Wąsowski, 2001 and Wotava, 2000.

According to experts of International Monetary Fund, tax havens manage the deposit sum of over 5 thousand million dollars, which is half of the funds invested outside the states of the funds origin. It has been estimated that due to the existence of tax havens the third part of incomes of the global economy is not taxed. This does not mean, however, that tax havens are popular exclusively with criminal groups, as they provide a good place of investment for international corporations and people of high incomes, who want to optimize their tax expenses within legal regulations. Special Economic Zones created in Poland in order to attract foreign investors are also some kind of substitute for tax havens. Under the amendment of tax regulations of the year 2000, the Minister of Finance issued the order which classifies tax havens into:

1) Countries and territories recognized as tax havens due to their harmful competitive taxation.
2) Countries and territories considered tax havens with respect to transactions carried out within administrative services and other non-material services.
3) Countries and territories regarded as tax havens due to services of a financial character (Kościński, 1996).

The aim of the published order was to help tax offices deal with income tax issues concerning personal and corporate income tax payers who cooperate with businesses registered in tax havens.
The achievements of the scientific-technical revolution have stimulated the dynamic development of tools and technological means used to conduct criminal activity. The commonness of a fast and efficient information transfer combined with unlimited possibilities of global travelling has contributed to the emergence of cross-border organized crime. Electronic systems of money transfer have made money laundering an anonymous process, which is very difficult to identify. The phenomenon of legislative inertia has become a serious problem requiring some solutions in order to effectively prevent the process of money laundering. There are still no sufficient legal regulations concerning the issuance, circulation and purchase of electronic money (Wąsowski and Wąsowski, 2001), which is a virtual record on special SVC cards or on computer hard discs. According to the Bank of International Clearing in Basel, the electronic money should be “an untraceable and anonymous payment instrument to the bearer, allowing for an easy payment made to another person in any conditions and without participation of intermediary institutions.” The use of SVC cards with the microprocessor opens new possibilities for money launderers such as: payment for services and goods, transfer of money between accounts anywhere in the world and change of the money into classic means of payment without leaving any accounting trace. Unlike on-line transactions, the off-line ones preserve the anonymity of trading partners. In such cases the electronic money is usually issued for one transaction only. The so-far attempts of supervising the cyberspace have failed due to two reasons:

1) Technical limitations – the computing power of monitoring systems. According to some estimation by Interpol, the number of international transactions per day amounts to 70,000 and their total value equals 2 thousand million US dollars.

2) A protest of cyberspace users – an attack on the Internet users’ freedom (Kościelniak, 1999).

According to Bill Gates, the situation is dramatic, as the development of Internet techniques have annihilated the 25 year-old efforts of counteracting money laundering. The modern tools provided by the achievements of the scientific-technical revolution and the processes of the international integration have created possibility areas for organized crime.

**MONEY LAUNDERING AND GLOBAL ECONOMY – RELATIONS AND INFLUENCE**

It is impossible to provide an explicit definition of the negative influence of money laundering on market mechanisms, as the processes of funds legalization are one of the integral elements of organized criminal activity. No part of a finely created construction of organized crime, perfectly working in intricate mechanisms of the market games, can function in isolation. The neutralization of
at least one link of the relation chain of illegal operational activities will precipitate its failure. The denial of access to the consumption of illegitimate goods can render informal businesses insolvent, and thus cause their natural disappearance. Even a perfunctory analysis of the events in Columbia supports the thesis that the harmful influence of money laundering cannot be considered in isolation from other component pathologies of economic-financial character. The process of money laundering should be treated as a very serious threat to banking systems and market mechanisms on the macro-regional and global scale, especially when one takes into consideration the goals of organized criminal groups, the strategic significance of money laundering and the methods of its achievement.

</tbody>
</table>

The feedback between the closest environment of the process of money laundering and the process itself consists in stimulating the process in the first stage of the relation and counteracting it
through defensive mechanisms in the second one. A full definition of the feedback “paradox” requires some assessment of the process in three topic areas:

1) As a new mechanism which developed at the beginning of the 20th century, and which was not a consequence of the evolution of criminal activity. The mechanism was subject to transformations evoked by achievements of the scientific-technical revolution.

2) As a mechanism of appropriation defined through the infringement of narrow boundaries of lawful properties established by the socio-economic system.

3) Creation of new ethical and moral attitudes as a consequence of evolution of long-term development of the European cultural heritage (Jackson, 2004).

The human behaviour, which is determined by the process of evolution from the collecting era to the era of globalization, has been always expressed by a conflict between duties to the society and people’s individual needs. Money laundering as a process of the European heritage development requires some assessment with respect to: laws in force and motivation and justification of the human behaviour. This assessment should be made right at the turn of the centuries and at the moment of socio-geopolitical changes which are expressed through long-term trends characterized by revaluation.

CONCLUSIONS

The following paper present big influence of globalization on development the phenomenon on money laundering. It is necessary to underline that is not able to provide all objective and statistical presentation of the role and significance of particular factors stimulating the expansion and evolution of the process. This is due to the following reasons:

1) an interdisciplinary character of the research problems,

2) a short period of global and social recognition of the phenomenon as a threat to national and international systems.

Therefore, the following paper has focused on the presentation of the feedback nature in the following areas:

1) the influence of the scientific-technical revolution on the evolution of money laundering.

2) the role and importance of the interstate tax competition in the evolution of funds legalization.

3) threats posed by the process of money laundering to economic systems.

4) the concept range of the feedback assessment.

The achievement of the concept uniformity of international standards and regulations of organizational-legal systems of countries is an absolute necessity for the development and implementation of an effective system of preventing money laundering with respect to cooperation of
specialized institutions with the administration of justice. The turning point in each county system of combating the process of money laundering should be adoption of law preventing the introduction of money from illegal or unknown sources into the official circulation. The law should constitute a basis for the legal and organizational system with regard to counteracting legalization of financial means. The system should be composed of consistent penal, banking law and cautionary norms.

Summarizing the paper should underline that it is impossible to define explicitly the negative influence of money laundering on the functioning of particular financial institutions and on the market mechanism in a regional and global dimension. It is presumed, however, that managers of financial institutions regard the legalization of illegal funds as a threat mainly to the global economy. In their opinion, the phenomenon leads predominantly to wrong allocation of capital in global terms and to the weakening of the effectiveness of the market mechanism. Hence, the presumption can be made that managers overlook the threats of money laundering to the functioning of market mechanisms or financial institutions on a regional scale.

CHOICE OF LOCATION FOR SERVICE INTERNATIONALIZATION

STRATEGY FOR SMES

Meneses, Raquel; Teterevleva, Polina

Faculty of Economics, University of Porto, Porto, Portugal

ABSTRACT

Any company while going international faces several difficulties and limitations. A service company has some extra limitations due to the nature of the services it provides. Moreover, it is considered that the smaller and newer the company is, the more limitations it faces and the more difficult the process becomes. However, how can a small new service company internationalize?

The current study is a case analysis of a small Portuguese start-up company, which is working on the development, and implementation of a retail chain of cosmetics stores. The aim of the current study is to identify the key factors, which make the process of internationalization of such a company possible. The impact of the liability of foreignness, liability of outsidership, liability of smallness and newness, specifics of the process of the service internationalization and entrepreneurial aspect will be studied.

Keywords: Service Internationalization, Small and Medium Enterprises, Entrepreneurship, Location Choice, Networks, Entrepreneurial Experience.

INTRODUCTION

The rapid growth of globalisation, with the development of technology and service innovation going further every day, coupled with tough competition obliges companies to search for more sophisticated competitive advantages and develop international services. Besides, it is known that lately the economy has shifted towards services. About 75% of employment and gross national products are contributed by service activities in North America and Europe (Cicic et al, 1999, Lommelen et al., 2005). The process of service internationalization is also more complex than the process of goods internationalization.

Normally internationalization is connected with certain difficulties: liability of foreignness (Johanson & Vahlne, 1977; Zaheer, 1995, Hymer, 1960) and liability of outsidership (Johanson & Vahlne, 2009). Overcoming those liabilities requires a company to use many resources. If small companies do not have many resources available, they also face the liability of smallness (Aldrich & Audter, 1986) and the liability of newness (Singh et al 1986). How do they manage to go international? Do all
entrepreneurs manage the internationalization process the same way? Is entrepreneurial activity important for the process of internationalization?

There is not a wide variety of studies on service internationalization or the internationalization process for retail SMEs. When speaking about internationalization, some product supply for a foreign market is usually mentioned (Johanson & Vahlne, 1977, 2009; Oviatt & McDougall 1994, 2005), however the contemporary business world is providing us with far more opportunities. The existing theories and approaches will be analysed critically in order to find differences and similarities between the product and service internationalization processes. Within the framework of the current study a case of a PAR Company will be analysed. This company is working on opening retail chains of select cosmetics and perfumery stores. This company is a retail company which was created in February 2013 and which has already started the process of internationalization in Turkey, Brazil and Europe. This business case perfectly corresponds with our research question. The business case analysis was conducted using the Systematic Combining Approach (Dubois & Gadde 2002).

THEORETICAL BACKGROUND: INTERNATIONALIZATION CONSTRAINTS

Liability of Foreignness

In the academic literature there are studies describing the first constraint of internationalization – the liability of foreignness, which is connected with the fact that the new market entry is always facing a disadvantage of a lack of knowledge and the unprivileged position of the firm compared to local companies.

Hymer (1960) managed to identify several factors influencing a company when going international. The companies entering a foreign market have far less information about the market than the natives. Besides, local companies might have a different level of governmental support or the government might create additional barriers for foreign companies to enter. Finally, the currency rates fluctuation might create a currency risk, which in some cases might bring significant losses for the company. All these factors serve to accumulate an additional cost for the company in going international and might influence the success of such an initiative. Zaheer (1995) refers to the same factors defined by Hymer (1960), though he discovers that the firm might have several advantages, which compensate for the additional costs of doing business abroad. It is not always beneficial to copy local practices while doing business in another country since the company’s own practices might be more efficient and provide a competitive advantage over local companies.

According to the Uppsala model (Johanson & Vahlne, 1977), companies tend to formalize their entries incrementally – an establishment chain. They tend first to enter the psychically closest market because
the environment in those markets is easier to understand. Then companies tend to enter other markets gradually.

The basic assumptions of the Uppsala model are bounded by rationality and uncertainty. This model is dynamic: to be able to internationalize, the company has to acquire experiential knowledge, which in its turn can only be acquired while internationalizing. The firm, while making the decision regarding the location of the internationalization tends to undertake incremental commitment decisions, choosing the closest countries in terms of physic distance, in order to minimise the uncertainty of the market. Thus, the internationalization process necessarily requires many of the company’s resources in order to cover all the costs of doing business abroad and the time necessary for gaining experiential knowledge.

**Liability of Outsidership**

Twenty-two years later, Johanson and Vahlne (2009) consider outsidership in terms of a relevant network in the market rather than unfamiliarity, the main source of the uncertainty. Still considering knowledge creation as one of the fundamental processes and the biggest challenges for a company in the foreign market, they state that the company is using the network for searching and obtaining necessary information.

The growth of the level of knowledge might have a positive or negative impact on building trust and commitment. The reconsidered position of the authors states that the company, choosing the location for the internationalization, will go to the market where it and its partners see more opportunities. Moreover, in the situation where the company has no local partners yet, it will tend to choose the market where the opportunities for obtaining business connections are higher. The authors also argue that, while exploring the opportunity, such variables as trust, knowledge and commitment to the relationships should be taken into account.

Oviatt and McDougall in 1994 argue that “global start-ups” are not just uninteresting anomalies as was considered earlier, but new entities in the international market deserving detailed study. They define “… an international new venture as a business organization, that from inception, seeks to derive significant competitive advantage from the use of resources and the sale of outputs in multiple countries” (p. 49). The authors mention that the Uppsala Model is applicable for slowly internationalizing companies.

Oviatt and McDougall (2009) also pay attention to such elements as licensing and network alliances. They define International entrepreneurship as “the discovery, enactment, evaluation, and exploitation of opportunities - across national borders - to create future goods and services” (p.7). Oviatt and McDougall (1994, 2009) are moving us further towards understanding the nature of born global
companies; however, this article considers product internationalization and so does not answer our research question.

Schweizer, Vahlne and Johanson (2010) propose a more complex view of the internationalization process. They consider that internationalization should be seen as either a by-product of a firm’s attempt to improve its position within the network or because of entrepreneurial action. In the article the authors suggest improvements to Johanson and Vahlne’s (2009) business network internationalization process model, emphasising the entrepreneurial aspects of the process.

They consider the environment of the firm as dynamic, nonlinear and laced with networks. The model takes into account the importance of entrepreneurial activities, such as those needed for launching a born global company. Authors add such state variables as entrepreneurial capabilities as a supplement to knowledge and opportunities. Schweizer et al (2010) state that entrepreneurs operate under conditions of uncertainty and ambiguity, which causes entrepreneurial hesitation, but also allows the entrepreneur to choose more freely among the objectives that only become visible during the process.

Opportunity exploration and opportunity creation are basic entrepreneurial activities (Brito & Meneses, 2007). However, the way these activities are carried out, depends on each case. To go international, firms might use a relationship approach: they use personal and existing business relationships in order to gain information about the potential partnerships to be established and connections to be made.

The previous experience of the entrepreneur is also an important factor. Brockhaus and Horwitz (1986) argue that entrepreneurs do not just learn from their previous experience, but profit from it. Entrepreneurs managing their second enterprise, tend to do better than those with their first one, both in terms of sales and profits. This can also be applied to entrepreneurial internationalization experience: in their study, Reuber & Fischer (1997) have found evidence to support their hypothesis that the management team with previous international experience uses a strategic partnership to a greater extent, promoting faster and more efficient internationalization of the firm. In a study conducted by Spence & Crick (2007), the rapid and successful internationalization process of the companies studied is explained by the fact that those companies were “hiring an executive with relevant experience whose main role was to guide the firm to strategic international development” (Spence & Crick, 2007, p. 226). Moreover, Andersson (2011) argues that a company can go international in a very short period of time, using the entrepreneur’s prior knowledge and network. The strategy, which is “based on an entrepreneur’s knowledge, links to foreign markets and a cooperative arrangement with network partners, can be successful” (Andersson, 2011, p.638)

The research conducted by Andersson (2000), demonstrates that entrepreneurs are not all the same. They demonstrate different behavioural patterns, they are concerned with different aspects of the
business and they choose different strategies for their companies. There are three types of the entrepreneurs: Technical, Marketing and Structural:

- Technical Entrepreneur – his main concern is technology; the product and production development are his strategic priorities. Internationalization is not the key priority, however, a foreign order might lead to export internationalization or to a listening agreement, as long as this type of activities do not require many resources. The market choice depends on which countries are making the inquiries.

- Marketing Entrepreneur – the idea of the product/business for those entrepreneurs emerges from an existing need in the market and an idea of how to fulfil this need. He is proactive in the internationalization process and aims to find new channels to reach consumers. He is willing to establish new international ventures. This type of entrepreneur might choose markets in accordance with personal preferences and connections, instead of using an approach that is more rational.

- Structural Entrepreneur – He is aiming to restructure companies and industries. He acts in companies operating in mature industries and he implements his strategy at a corporate level. The process of internationalization is more the consequence of the entire strategy, rather than a goal for him. Markets are chosen according to the competitive situation.

The creation of a competitive advantage for SME while going international promotes the entrepreneur to innovate. Aron O’Cass & Weerawardena, (2009) argue “that the SME internationalisation process is an entrepreneurial activity and entrepreneurial SMEs pursuing international market entry actively undertake innovation in all areas of value-creating activities” (O’Cass & Weerawardena, 2009, p. 1338) Therefore, the capacity of the entrepreneur to innovate is an important factor in business success. According to Frishhammar & Andersson (2009) it is also vital for the entrepreneur to be proactive. Their study shows that this has a far greater influence on the success of SMEs internationalization than strategic orientations.

**Liability of Smallness and newness**

In 1986, Aldrich & Auster conducted a study proving that for all types of firms – small and large, there are both advantages and disadvantages, and there are strategies to overcome these disadvantages. Among the liabilities for small and new companies the authors define problems of raising capital, meeting all the government requirements and being competitive in terms of labour with larger organizations, however those paths are connected with the risk of increased dependence and possible loss of control. For small companies, there are several strategies for survival: partnership, franchising, contracting and being acquired. Aldrich & Auster (1986) state that small and new companies tend to have a higher mortality rate than larger, older ones. They draw the conclusion that normally, the price
of surviving, getting older and growing is high for many companies. They have to lose their autonomy.

Studying the liability of newness, Singh et al (1986) also conclude that the lifespan of new organizations is much shorter than for more mature ones. However, authors draw the conclusion that the acquisition of legitimacy by the organization significantly attenuates such liability. Singh et al (1986) also suggest that the attempts of the company to get institutional support might significantly increase its chance of survival.

The specifics of the service internationalization process

The main reason why the processes of service and product internationalization cannot be similar is hidden in the nature of the entities: “product” and “service”.

The key differences between product and service from the marketing and logistics point of view are the following. Firstly, products have physical distribution channels in order to reach the customer, while the majority of pure services do not need these (Demirkan et al, 2011). Therefore, talking about different entry modes while expanding into a new country, such as intermediaries, might not be relevant in some service companies’ cases. Secondly, the level of the personalization of the service is always much higher, as long as the service consumer always expects an individual approach, while good customers are purchasing standardized pieces very often (Patterson & Cicic, 1995; Cant & van Heerden, 2005). Thirdly, the product is a tangible entity; the customer has an opportunity to test it before buying, while the purchase of a service in many cases is based on trust (Patterson & Cicic, 1995, Goerzen & Makino, 2007; Boddewyn et al, 1986, Demirkan et al, 2011). Fourthly, the processes of creating products and services are totally different: the majority of products require machinery and raw materials, while services require skills, experience, competencies and motivation of the person who delivers the service (Cant & van Heerden, 2005; Goerzen & Makino, 2007). Fifthly, growing the business for the product company means producing more and reaching new clients, while for the service company expansion also requires improvement of the characteristics of the service provider (Demirkan et al, 2011; Cant & van Heerden, 2005, Boddewyn et al, 1986).

Therefore, we can see that all of the processes starting from creation and finishing with approaching the customer to provide goods and services are different; therefore, the internationalization paths of the goods providers and service providers are different too. For the service companies the entry mode, the production and the distribution channel should vary. The adaptation of the service for entering the new country is also more complicated rather than the adaptation of a product, as long as it implies taking further into consideration the cultural differences, the language, the diversification and access to technologies in the country, the behavioural norms and standards, the economic issues and so on.
In 1986, Boddewyn et al claim that one of the major difficulties in the process of service internationalization is associated with licensing and management contracts. “In their pure forms, they do not involve any equity since only technology or management skills are sold to another party [Buckley 1983b]. Besides, they use the "external market" rather than "internalization" within the international firm as a mode of transfer [Buckley and Casson 1985, p. 51]. Therefore, they cannot be considered forms of direct foreign investment” (p.47). The authors also emphasise the fact that the trade process in the case of services is losing its clarity and transparency – the money is paid, but there is no way either to estimate the process of production of the service or to control its quality.

Boddewyn et al (1896) also define several ownership advantages for service companies. Firstly, it is an Internalization Advantage: in the case of customer service, the internalization process might be conducted even in the absence of equity investments. Secondly, it is Location Advantage: in terms of location requirements, international services have no special problems. In 1995, Patterson & Cicic claim that due to the intangibility of the service, providers are limited in their entry mode options; meanwhile the entry mode is a key success factor for service internationalization. They also state that for those services, which require a lot of interaction between the customer and service provider, the cultural aspect is one of the key factors.

The development of the global economy, globalization and technological development have been changing the world rapidly. The development and spread of all kinds of communication technologies has moved service companies to a new level. In 1999, Cicic et al (1999) conducted research in order to develop a model of service internationalization. Some stages of the processes and service internationalization are similar to product internationalization; however, there are many stages, which are different. They define “hard” services – not pure services, but services embedded in goods, and “soft” services – the standard pure services. The “hard” services, due to their high similarity with goods are more likely to internationalize via standard and traditional entry modes; they are less influenced by cultural and technological differences, while “soft” services require a totally different approach, and the entry mode for such services should be adapted. The “hard” services due to their tangible nature have to pass all the phases: Pre-International Stage, Exporting Stage and Higher Commitment Stage, while “soft” services do not require the exporting stage due to their intangible nature. Retail service is a soft service according to this classification. Ergo, the cultural aspect, as well as the psychological aspect and the presence of necessary skills and expertise are the most important.

**CONCEPTUAL FRAMEWORK FOR ANALYSIS**

Any company entering the foreign market faces difficulties depending on the type of the company and the types of the goods/services the company offers.
Any company faces two major disadvantages. The first one is the liability of foreignness – disadvantages connected with lack of information about the host country market (Johanson & Vahlne, 1977; Hymer, 1960; Zaheer, 1995), an unprivileged position in the eyes of the local government (Hymer, 1960; Zaheer, 1995), higher costs of doing business abroad in comparison to local companies (Hymer, 1960; Zaheer, 1995), the currency risk (Hymer, 1960) and the availability of resources (Johanson & Vahlne, 1977). The second one is the liability of outsidership – the lack of a network in the target country, difficulties of identifying market opportunities, inability to make business connections and difficulty in gaining mutual trust with local partners (Johanson & Vahlne, 2009). Besides, the internationalization strategy might depend a lot on entrepreneurial action (Schweizer, et al., 2010), the type of the entrepreneur, as well as on his previous experience and network (Brockhaus & Horwitz, 1986; Reuber & Fischer, 1997; Andersson, 2000, 2011; Spence & Crick, 2007, Johanson & Vahlne, 2009). Moreover, the international entrepreneur should be innovative and proactive (O’Cass & Weerawardena, 2009; Frishammar & Andersson, 2009).

However, when a new, small company is willing to internationalize, there appear to be even more constraints – liability of newness and smallness - such issues as problems of raising capital, meeting all the government requirements and being competitive in terms of labour with larger organizations (Aldrich & Auster, 1986). There is also a very high probability of early failure in a young company, and even if it manages to survive, in many cases it risks losing its independence (Aldrich & Auster, 1986).

When a new small service company is searching for an opportunity to go international, it should be taking into account the types of services it is providing and the specific nature of those services. Depending on the type of service, “hard” and “soft” services follow different internationalization paths (Cicic et al, 1995). It is important to choose the entry mode carefully (Patterson & Cicic, 1995). The company should also take into account the difficulty of controlling the quality and the price of the service due to its intangible nature, and consider the psychological and cultural differences of the customers in the country of destination and be able to adapt the service correspondingly (Boddewyn et al, 1896). For a consumer to purchase a service, the trust factor is also essential (Patterson & Cicic, 1995, Goerzen & Makino, 2007; Boddewyn et al, 1986, Demirkan et al, 2011). Finally, it is important to mention that the market is not always a passive part in the internationalization process. In many cases, the market attracts the company there (Buvik, 2002; Brito & Meneses, 2007).

Therefore, we can define several challenges new service SMEs might face during their internationalization process (Table 1)

Table 1. Factors influencing the process of internationalization of service SMEs

METHODOLOGY

The methodology used for the current research is qualitative analysis. Within the framework of this study, the case study strategy will be used as long as such a strategy allows understanding of dynamic changes within single settings and is helpful to cope with the fact of intangibility of many resources in an organization (Hoskisson et al, 1999). The information was collected using the official documents of the company and conducting interviews with its founders, asking them to expound their view of the factors influencing the process of the internationalization of the company. – A triangulation approach was used, which is usual for case studies. The sources of evidence were combined while shifting between analysis and interpretation, which allows for collecting and double-checking findings (Dubois & Gadde, 2002)

THE CASE

The case analysed in this study is a Portuguese start-up company which was founded in 2013 and is currently working on a project to create a new cosmetics brand and open its own brand and multi-brand cosmetics stores in Europe, Turkey and Brazil. Besides products, the concept of the brand, created by this company, assumes intense interaction with the clients. The two core values of the brand, personalization and emotional connection, assume a number of service activities. The company is a “hard” service provider.

The dimension of the company is impressively small. It was founded by 3 entrepreneurs who had previous experience in 3 key areas of the business: Retail & Logistics, Training & RD and Marketing & Communication.

Pedro has more than 15 years of experience in Retail & Logistics, opening and managing selective perfumery stores. He created and developed a retail chain for selective perfumeries, which became a
reference in Brazil, winning the ALSHOP/VISA award in 2004, 2005 and 2006 for the best shop concept.

António is a chemical engineer and has 32 years of experience as a General Manager in a company, which was the biggest distributor of a select cosmetics brand in Portugal. While working for a Portuguese selective perfume company, he was responsible for launching international selective brands. For 7 years, António was the president of the Portuguese association of the cosmetics industry and a member of the European cosmetics and personnel care association COLIPA, based in Brussels. He is also currently working as a business consultant for a Portuguese Consultancy Company.

Rogério has 21 years of experience in designing and executing marketing and communication plans. He has a rich experience of working in the international business environment. Rogério has managed many Portuguese artists’ careers, as he has been working in the music industry for 15 years, organizing marketing campaigns with TV channels, radio stations, magazines and social media. He has also developed projects with international partners.

Besides the three founders there are 4 more people working in the company. We found this case interesting, since we can analyse a situation where 7 people are preparing and implementing such a global project.

**DISCUSSION**

Interviews were conducted with the founders and information collected. The importance of the factors mentioned in table 1 was studied. The following results were noted (table 2) (the numbers represent the number of times the issue was mentioned in the interviews and the documents):

Table 2. *The factors influencing the process of internationalization of PAR*

It is interesting to note that from the results, the most relevant factor for PAR is the previous Experience of the Entrepreneurs (in line with Brockhaus & Horwitz, 1986; Reuber & Fischer, 1997; Andersson, 2011; Spence & Crick, 2007). António claimed in the interview: “Experience is the fundamental basis of the process. Without it, the founders would not have been able to advance with the project”.

The second important factor is the Types of Entrepreneurs; though there are not so many references, the impact of this factor is significant. PAR is the case where all 3 types are working together, complementing each other in terms of knowledge. Based on the actions, main concerns, core
competence and strategies of each of the founders, we can conclude that Pedro is a Structural Entrepreneur, António is a Technical Entrepreneur and Rogério is a Marketing Entrepreneur (Andersson, 2000; Brito & Meneses, 2007).

The next most important factor is Capability to Innovate. (O’Cass & Weerawardena, 2009) The experience in the three key areas not only helps the founders to organize and manage the business processes, but it also allows them to introduce new activities and services to the business which “has remained the same for the last dozen years, where all the stimuli are based on price” (António). They are capable of identifying the weak points of the business and presenting an innovative solution to gain competitive advantages.

Market Opportunity (Johanson & Vahlne, 2009) is also an important factor. The entrepreneurs are able to define existing opportunities and develop a project in accordance with them. To do so, the entrepreneurs should be proactive (Frishammar & Andersson, 2009), which is the fifth important factor for the current case. The Proactive Attitude allows entrepreneurs to identify, analyse and take advantage of market opportunity.

In the case of PAR, market is not a passive part of the process of internationalization. The three founders were contacted by business partners from Turkey with a view of developing a project specifically for the Turkish market. After this call, the current market situation was carefully studied and all the necessary information was obtained in order to make sure the opportunity existed. Adequate actions were undertaken to develop and implement the project. Thus, Market Call (Buvik, 2002; Brito & Meneses, 2007), Market Information (Johanson & Vahlne, 1977; Hymer, 1960; Zaheer, 1995) and Entrepreneurial Action (Schweizer, Johanson & Vahlne, 2010) are the next most relevant factors.

Some potential markets, seemed very attractive at first glance, but it became apparent that entry modes are very limited to this market. “There are countries in Central and South America where there are cartels” (António). Such organisations limit the entry modes and complicate the entry process. For these countries, PAR had to delay the process of internationalization - the Entry Mode limitations Factor (Patterson & Cicic 1995)

One of the biggest concerns named by the founders is the adaptation of the concept of the store, the brand identity and the communication strategy to make it attractive for young consumers in the destination countries. However, having partners in the destination countries facilitates the process of knowledge acquisition and negotiations. The large number of network connections also facilitates an access to suppliers, consultants, potential business partners, etc. Therefore, Cultural Aspect (Boddewyn et al 1896) and Relevant Network (Reuber & Fisher, 1997; Andersson 2011; Johanson & Vahlne, 2009) are of vital importance for the PAR case.
Capital Availability (Aldrich & Auster, 1986) is also an important factor for success in the process of internationalization for PAR. The investors and business partners are currently being sought. “The idea is very interesting; the project is innovative, so fortunately we cannot complain about a lack of investor interest to join us” (Rogerio). Meeting Governmental Requirements (Aldrich & Auster, 1986) is also a subject of concern; however, it is not a difficulty in PAR’s case since according to António “present legislation facilitates a lot of the export process”.

Finally, such factors as Government Barriers (Hymer, 1960; Zaheer, 1995), Currency Fluctuation (Hymer, 1960), Cost of Doing Business Abroad (Hymer, 1960; Zaheer, 1995), Physical Distance (Johanson & Vahlne, 2009), Labour Competitiveness (Aldrich & Auster, 1986) and Lack of Transparency and Clarity (Boddewyn et al, 1896) seem not to be relevant to the current stage of PAR’s internationalization process.

CONCLUSIONS AND LIMITATIONS

The case provides us with an example of how a company which only consists of 7 people is able to work on a projected retail chain of cosmetics stores which is supposed to be implemented on 3 continents.

We were able to witness the importance of entrepreneurial characteristics such as previous experience, the type the entrepreneur belongs to, innovation capabilities, proactivity and capacity to undertake certain actions. In the case of PAR, the entire project would have been impossible without the founders having these characteristics. The founders’ network is very important for the development of the project as well, since it is a source of getting market information and establishing the business connections.

We can conclude that the process of internationalizing a service company is more complex than the internationalization of a product company; however, such a small company managed to do it. In this case, the barriers are successfully overcome due to the capabilities of the management team.

This case stresses Hambrick and Mason’s (1984) idea that the company is often a reflection of its management team. In addition, we can conclude that when the 3 types of entrepreneurs collaborate and do business together, the internationalization process happens much faster, since they complement each other in terms of knowledge, and such collaboration helps in overcoming the obstacles the company faces during the internationalization process (Brito & Meneses, 2007).

The case is also interesting because the market plays an active role in the process of internationalization. The founders were asked to develop a project for a specific market, which later adapted for other countries. There are other factors, which influence the process of internationalization of the company such as market opportunity, market information, entry mode...
limitations, cultural aspect, capital availability and meeting government requirements. However, the entrepreneurial spirit of the founders led them to recognize opportunities, and made them willing to undertake the risk. The main limitation of the current research is that only one case was studied, therefore we suggest a more profound investigation be conducted with the participation of more companies with a profile similar to PAR’s.

RESPONSIBLE MANAGEMENT DURING THE FIRM’S INTERNATIONALIZATION TO BASE-OF-THE-PYRAMID COUNTRIES:
A CASE-STUDY OF THE FABER-CASTELL GROUP

Meneses, Raquel F.¹, Staender, Christiane S.²

ABSTRACT

Globalization has changed the international business environment, enabling firms to operate in more global and complex contexts with an increasing impact on society and the natural environment. Simultaneously, Responsible Business Practices (RBP) are growing in importance - not only domestically, but also during the firm’s internationalization to different contexts, such as from developed to base-of-the-pyramid countries (BOPs). Hence, the goal of this research is to assess whether and how a company, headquartered in the developed world, adopts and adapts RBP when internationalizing to BOPs. For this purpose, a qualitative methodology in form of a case study of the Faber-Castell Group, supported by a semi-structured interview with an internal key person in corporate sustainability, was used to study the international RBP behavior of the company. This research creates value in the field of International Business Studies, by integrating RBP, FDI and international business ethics in different contexts, and demonstrating how sustainable international management can be operationalized. The RBP adoption in BOPs depends on strong collaboration and dialogue networks with entities of different kinds that pursue profound local knowledge; however, a basic standardized RBP framework in combination with some RBP adaptation is necessary for a successful RBP adoption that results in a variety of internal and external benefits.

Keywords: International Business (Ethics); Internationalization; Responsible Business Practices; Adoption and Adaptation; Sustainable Management; Base-of-the Pyramid

INTRODUCTION

As a matter of fact, globalization has changed the international business environment by enabling firms to operate in more global and rapidly changing contexts (Dahlsrud, 2008) in which the imperatives of global integration and local responsiveness are becoming increasingly critical for internationally operating companies (Bartlett and Ghoshal, 2002).
Moreover, whilst global governance lost its ability to effectively regulate affairs such as the way business affects social and environmental matters, some firms are gaining in impact and influence (Scherer and Palazzo, 2011) causing the need for responsible business practices (RBP) that lead to sustainable development (Landrum, 2007), defined as a “development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (WCED, 1987, p.37).

Nevertheless, the debate on the firm’s nature in society and the relevance of RBP exists (Scherer and Palazzo, 2011; Friedman, 1970), yet currently strategies adding to business value, sustainable success and development are augmenting in importance, leading to an increased range of responsibilities that guide the firms’ global decision-making processes (Bardy et al., 2012).

Besides, the majority of countries have been considered developing or emerging in 2010 (Choi et al., 2010), existing a need for these countries to get more globally integrated in international business research, amongst others through RBP and sustainable development (UNCTAD, 2013; Choi et al., 2010).

The motivation to do more research on RBP and sustainable management in BOPs is associated with the future need of linking economic and social value creation, as well as the fact that far more research has been made on RBP in developed countries, than for the developing world, where a stronger need for corporate RBP exists since there are fewer institutions providing general social goods (Dobers and Halme, 2009). Furthermore, research on RBP implementation is scarce once the adoption of RBP being a changing process within firms (Lindgreen et al., 2009). Therefore, further research on the complexity of the RBP concept and its successful adoption across different cultures is required (Bondy and Starkey, 2014; Kleine and von Hauff, 2009; Lindgreen et al., 2009) and specific case studies of firms that integrate RBP, business ethics and FDI issues needed, in order to get a better understanding of the influence of contextual components that firms experience when designing their RBP strategies (Bardy et al., 2012). Therefore, the focus of this research is on the impact of context on organizational behavior (Johns, 2006) by creating an attempt to answer the questions of whether and how a firm from the developed world adopts and adapts RBP when internationalizing to BOPs. This will be achieved by confronting theory and practice through a case study of a German-based company with responsibilities in BOPs and thus adds to the international management literature by addressing the recommendations mentioned earlier. In the following sections, the recent literature on RBP and BOPs will be reviewed, the adopted research methodology explained and the case study discussed. Conclusions, research limitations, as well as inputs for future research will then follow.
BUSINESS AND SOCIETY: RESPONSIBLE BUSINESS PRACTICES (RBP)

The business - society relationship is based on the interdependence of both parts and has generated strong criticism on our business system in the past, emphasizing the need that “companies must take the lead in bringing business and society back together” (Porter and Kramer, 2011; p.4) and thus causing business’ cumulative awareness of RBP, defined as a company’s voluntary activities that link social and environmental concerns with its business operations, by ethically interacting with its stakeholders (Van Marrewijk, 2003).

In fact, RBP is a complex and multi-disciplinary notion (Lindgreen et al., 2009) that has a variety of related concepts which include Corporate Sustainability (Van Marrewijk, 2003), Stakeholder Management (Choi and Wang, 2009), Corporate Social Responsibility (Carroll and Shabana, 2010) or Corporate Shared Value (Porter and Kramer, 2011), for instance. Most of these approaches differ from each other, but are based on the same general idea of business’ voluntary engagement in practices that favor its surroundings (Van Marrewijk, 2003). In this research, the same happens for RBP by integrating all related concepts.

Besides, in an era of increased public exposure through modern communication channels that enable a faster spread of information, a key proposition is that firms should pursue a triple bottom line, considering their economic, environmental and social performance and impact simultaneously and thus create corporate sustainability (Goel, 2010). Actually, it was found out that better relations to stakeholders lead to increased shareholder value in the long term (Choi and Wang, 2009), making RBP an indispensable management tool for the implementation of a successful business strategy (Dahlsrud, 2008). Here, RBP include firm responsibilities of a multidimensional nature (Carroll, 1991): the firm’s economic responsibility (producing goods and services that society needs and sell them at a fair price, maintain competitiveness and act efficiently, in order to be able to generate sufficient income to pay its bills and reward its shareholders (Carroll and Buchholtz, 2011)), legal responsibility (performing within regional or local legal obligations (Carroll and Shabana, 2010)), ethical responsibility (acting within social mores that are not codified by legislation (Jamali and Mirshak, 2007) and lastly, philanthropic responsibility (the voluntary contribution of the firm’s resources to society (Carroll and Buchholtz, 2011)). In short, modern firms have to assume responsibilities that go beyond the fulfillment of their missions (Jamali and Mirshak, 2007).

RBP ADOPTION

Recently, RBP forms and theories evolved, demonstrating that they might be accompanied by benefits for business when applied strategically (Porter and Kramer, 2011; Choi and Wang, 2009).

Basically speaking, there are three RBP forms firms can apply, in order to operationalize their
responsibilities: Philanthropic Behavior, Integration and Innovation (Halme and Laurila, 2009). While Philanthropic Behavior means concentrating on RBP that take place outside the firm’s core business activities and does not produce direct benefits for the company, the idea of Integration aims more responsible behavior in existing core operations (e.g. paying just wages, stakeholder management, eco-efficient production) and thus succeeds to create benefits related to the firm’s reputation, risk reduction and cost-savings (idem.). Innovation, on the other hand, intents to create new business models or implement strategies that solve or at least alleviate societal problems while simultaneously creating strong business benefits (idem.).

Now, efforts have been made to describe the organizational process of RBP adoption; however, it is argued that this adoption is a company-specific process, meaning that every firm needs to give its own individual meaning to RBP action (Cramer et al., 2010). Here, a practical framework for RBP adoption is suggested by the German Council for Sustainable Development (GCSD) (2006), for instance, that allows managers a better organization of the RBP implementation process in general and includes the following steps (GCSD, 2006): (1) the identification of the firm’s intention to engage in RBP and thus create a win-win situation for itself and its stakeholders,, including an analysis of the firm’s status quo and its surroundings (e.g. strategic goals, availability of resources, RBP activities of competitors, RBP forms and effects). (2) The definition of the firm’s focal points and the establishment of RBP goals to individualize its RBP action, referring to factors such as the firm’s philosophy, the aims of its action, sector-relevant issues, the firm’s capacity and legal context, stakeholder interests and the definition of the firm’s RBP to approach them. (3) The establishment of internal agreement and management commitment to certain RBP action, as well as clearly defined responsibilities are needed for RBP integration that can be achieved through codes of conduct, internal or industry-specific standards and management systems, for instance, and finally (4) RBP reporting, as well as internal and external stakeholder communication of RBP action are part of the continuous RBP improvement process and fundamental, in order to create more transparency and credibility (Kleine and von Hauff, 2009). Reporting can be done via GRI Guidelines, audits and certifications and through regular revisions by representatives of the industry and stakeholders, relevant, detailed and comparable information can be gathered. Moreover, the communication of RBP goals and action to all stakeholders, and thus adequate communication channels are of the utmost importance (GCSD, 2006) and in order to analyze indicators, goals and areas of action more properly, the Integrative Sustainability Triangle can be applied (see Kleine and von Hauff, 2009).

This process seems to be a useful tool for RBP adoption and following the steps is easy in well-known domestic market contexts. Yet, the question remains whether firms also proceed in this manner when operating abroad. The following sections will shed some light on this issue.
LINKING RBP AND THE FIRM’S INTERNATIONALIZATION PROCESS TO BOPS

De facto, global markets are more dynamic and diverse than domestic ones (Alon and Jaffe, 2013) and thus a variety of aspects need to be considered when linking RBP to the firm’s internationalization process (e.g. contextual components that may influence RBP action and that firms experience when developing their RBP abroad).

The majority of countries have been considered developing or emerging in 2010 (about 80% of the world’s population) and will be held as BOPs, namely (1) developing and (2) emerging countries (Choi et al., 2010) in the context of this research. BOPs represent great market opportunities and often provide lower relative labor costs that attract increasingly more firms headquartered in the developed world. Unfortunately, regulation inefficiencies and imprecision of suitable international business behavior exist (Scherer and Palazzo, 2011) and are serious aspects in this context as firms may exploit them for their purposes and act irresponsibly abroad (e.g. corruption or social/environmental dumping practices). Besides, due to the existing cultural, economic, political and legal diversity that prevails between most developed countries and BOPs, there is a certain danger of ignoring different context-specific perspectives on RBP, and corporate misbehavior may also be a result of that (Dobers and Halme, 2009). Firms may be willing to contribute to sustainable local development, but without a proper analysis of what is really needed and understood as RBP, there won’t be such a win-win situation and the firm’s will to act responsibly might be understood quite negatively. It results from this that there is a growing importance of strategic RBP in BOPs that prevent negative externalities of insufficient local knowledge or even mere goal achievement, that strengthen sustainable international business and are accompanied by gains in competitive advantage, innovation and added value (Ganescu, 2012; Landrum, 2007). But what exactly is understood as fair behavior in each context, who defines what a specific community really needs and how do firms proceed to be able to implement successful RBP action in BOPs?

Certainly, the degree of context-specific RBP adaptation depends on the management’s global perspective of the firm (Alon and Jaffe, 2013). In Perlmutter’s (1969) line of thinking, this would mean that an ethnocentric RBP orientation would imply RBP standardization; a polycentric orientation strong RBP adaptation with subsidiaries developing their own strategy; a regiocentric orientation would develop one RBP strategy per region; and a geocentric view global RBP integration with some context-specific adaptations. Bondy and Starkey (2014) emphasize the on-going debate on whether RBP adoption should focus on global or local issues, and Arthaud-Day (2005) illustrates that there is a direct link between international business strategy and responsible business behavior. In that line of thinking, global firms would define standardized RBP wherever they operate; Multinationals would adopt
diverse RBP that would differ across contexts; Internationals would adopt different RBP in their home and host countries and Transnationals would adopt a mix of both global RBP integration in combination with an adaptation of this strategies to context-specific needs (idem.). Here, local managers with strong local knowledge of what a specific community really needs and understands as RBP are fundamental (idem.).

However, even once having obtained local knowledge on ethical values and RBP understanding, doubts start with which values to follow (those of the firm’s home market (absolutism), the ones of the host market (relativism) or even international/universal guidelines (universalism) (Alon and Jaffe, 2013), agreed minimum values shared across cultural boundaries (Melé and Sánchez-Runde, 2013), such as the International Standardization Organization’s (ISO) standards, the Organization for Economic Co-operation and Development’s (OECD) guidelines for multinational enterprises, the Global Reporting Initiative (GRI) guidelines, the UN Global Compact or the International Labour Organization’s (ILO) Convention.

Additionally, successful international RBP adoption requires sensitivity to host countries’ needs (Bondy and Starkey, 2014; Lindgreen et al., 2009) that can be obtained via collaboration (Baumann-Pauly et al., 2013) and is based on a partnership selection process- a decision that is influenced by each firm’s strategic goals- including (1) the assessment of possible partners, (2) partnership selection criteria setting and choice, (3) contact and (4) communication between partners on ideas for joint RBP adoption (Seitanidi and Crane, 2009). It comprises different kinds of collaboration, such as external engagement with local or international organizations (IOs), Non-governmental organizations (NGOs), intra-/inter-industrial collaboration, governmental institutions or external stakeholders and via RBP networks (e.g. CSR Europe, World Business Council for Sustainable Development (WBCSD)), as well as an internal one with employees (Sharma and Kearins, 2011; GCSD, 2006). Employee engagement is a success factor of RBP adoption as it creates support throughout the organization, and needs to be emphasized by employee training, communication and reporting on the importance of RBP, as well as what effects it has on the community and the firm (Bolton et al., 2011; Cramer et al., 2010). This also depends on an integration of RBP culture and action in corporate development processes at all levels, above all via horizontal integration across departments (Kleine and von Hauff, 2009).

To sum up, operating in BOPs brings about additional concerns on effective RBP adoption. It depends on the firm’s management perspective and internationalization strategy on which degree to adapt RBP; yet, successful international RBP adoption depends on context-specific adaptation that implies access to local knowledge, in order to create sustainable international business with mutual benefits. This access can be gained through different kinds of collaboration.
RESEARCH METHODOLOGY

Given the fact that realities such as the understanding of RBP and ethics are quite subjective issues, a qualitative methodology was chosen for the empirical part of this research. The case study method is appropriate in this sense as it allows the researchers to get an in-depth view of organizational decision-making processes (Yin, 2009). For this purpose, a variety of data sources were combined to provide a clearer understanding of the chosen firm’s international RBP behavior (also known as “triangulation” (Denzin, 1970)). Two different, but complementing data collection techniques were adopted: In the first place, a semi-structured interview was conducted based on interview guidelines we created through the literature review, to generate more details and collect testimonies of an internal key person responsible for RBP adoption and corporate sustainability. We assured the interviewee makes strategic RBP decisions on a daily and international basis and has a mature experience in the international RBP adoption process, thus enabling us to get more detailed insights into a number of RBP and their development within the firm. To guarantee data reliability, the interview statements were triangulated with publicly available as well as internal documents (such as sustainability and annual reports, as well as corporate presentations and information published on the firm’s websites) and external stakeholder perspectives (through newspaper articles, as well as websites and documents of NGOs, IOs and networks the firm is collaborating with). The data was collected from December 2013 - May 2014 and the company selected based on (1) its level of RBP engagement, in order to cover a wider spectrum of RBP adoption, (2) its experience regarding BOPs (operating in at least three BOPs) to make sure it has RBP adoption experience in diverse BOP contexts, and (3) its headquarter in the developed world, in order to ensure a greater difference between domestic and BOP culture. After gathering data from different sources, it was prepared for content analysis including full reading of the transcribed information, coding (creating categories and linked sub-categories and topic descriptions) and interpretation of facts.

CASE-STUDY: SUSTAINABLE INTERNATIONAL BUSINESS AT THE FABER-CASTELL GROUP

---The following data has been obtained through an extensive combination of internal and external sources, described in the section above. The information received thanks to the personal interview with Mr. Braun, Head of Corporate Quality and Sustainability at the Faber-Castell Group, on March, 10 2014, in Stein, Germany, will be referred to as “Braun, 2014”. ---

The world’s leading manufacturer of wood-cased pencils, Faber-Castell, was established in 1761 by Kasper Faber and is a family-owned company that counts on a wide range of products for drawing, writing and decorative cosmetics. Headquartered in Stein near Nuremberg, Germany, Faber-Castell is
one of the oldest industrial companies and is nowadays being managed in its 8th generation by Count Anton-Wolfgang von Faber-Castell. It was also under his management that Faber-Castell became a non-listed stock company in 2000, yet making a continuous and balanced investment in its economic, environmental and social responsibility domains (Braun, 2014).

Certainly, the choice for including the Faber-Castell Group in this research project has to do with its continuous search for sustainable development through diverse RBP forms and the way they are put into practice. Yet, another reason for this choice has to do with the company’s strong international presence and profound experience in BOPs, thus being an expert in cross-cultural RBP issues. Once having internationalized its operations via FDI, the Faber-Castell Group is nowadays operating 14 production sites in nine countries (Austria, Brazil, China, Colombia, Germany, India, Indonesia, Malaysia and Peru) and is marketing its products through 25 commercial subsidiaries, thus being represented in 120 different countries across the globe and counting on about 7,500 employees worldwide (idem.).

**DISCUSSION**

Even being a stock company, the Faber-Castell Group is able to demonstrate that it can just as well think and act in sustainable manners by innovatively combining shareholder and stakeholder theorists’ lines of thinking. This is being realized through a “triple bottom line” thinking which leads to true corporate sustainability (Van Marrewijk, 2003). The connection of these three domains is integrated into Faber-Castell’s corporate culture, policy (“10 Guiding Principles”) and core values (“Brand Essentials”) that have been centrally defined by the firm’s headquarter (HQ) and implemented in the firm’s worldwide operations through an integrated management system, called FABIQUS, for standardized processes in quality, environmental and social issues. Here, a continuous improvement is achieved through PDCA (Plan, Do, Check, Act) cycles, leading to better efficiency, globally consistent quality and more transparency (through a reporting system based on the GRI).

Moreover, when it comes to the question of which ethical values and RBP understanding to apply in BOPs, Faber-Castell decided to opt for a mix of RBP Universalism and Relativism. This has also to do with the Firm’s geocentric management view and transnational strategy by promoting the collaboration of HQ and local management teams to establish globally integrated standards and permit certain local responsiveness: “(…) a certain basic framework of standards is needed, but you do also need to adapt to local circumstances in order to be successful with your international RBP strategy” (Braun, 2014). According to Bartlett and Ghoshal (2002), it is exactly this firm mentality of creating a mix of global integration and local responsiveness that is needed due to the increasing complexity of the international business environment. Actually, a great number of authors (Halme and Laurila, 2009;
Lindgreen et al., 2009; Jamali and Mirshak, 2007) confirm this idea by stating that contextual differences influence RBP needs and cause a demand for diverse responses, being local managers with local knowledge of appropriate RBP fundamental (Arthaud-Day, 2005), also for Faber-Castell: “(...) it is important to maintain a dialogue with subsidiaries and suppliers and to be sensitive to regional differences. (...) We pursue a decentralized organization and appreciate management teams consisting of locals that are strongly involved in each region. (...) Considering the subject of wage calculation, for instance, we decided to implement “decent wages” in our worldwide operations. As the comprehension of what is decent is country-specific, we decided to discuss the local understanding of decent wages with the local labor unions and managers. (...) Then, you also need to pay attention to regional differences in terms of not only paying salaries in money. In Indonesia, for instance, we have about 30 additional agreements such as washing laundry, medical assistance, child care programs, etc. that we provide to our employees. These are all issues that require strong local knowledge we don’t have here at the Faber-Castell headquarter” (Braun, 2014). Other ways of obtaining such context-specific knowledge include contacts such as to local governments or the UN and RBP collaboration with NGOs, as well as suggestions of local employees that have direct connections to local communities. Furthermore, cross-sector dialogue networks, such as in discussion groups of the World Wide Fund for Nature (WWF) or the Biodiversity for Good Company Initiative are seen as fundamental to share RBP ideas and experiences in different BOPs. Together with the support of the central sustainability department in Germany, viable and meaningful projects that are in line with the firm’s principles and goals are then selected and executed (Braun, 2014).

A specific example of globally integrated standards is the Faber-Castell Social Charta that was signed in 2000 with the trade union IG Metall (a strict code of conduct on social criteria that is based on the employment and working conditions of the ILO), as well as the principles of the UN Global Compact (which Faber-Castell joint as the first firm of its sector in 2003), for example. These standards are monitored by a regular three-level audit control (first, through internal checklists by each site, second by internal auditors from the HQ and third, by a monitoring committee consisting of external representatives of the international trade union BWI and IG Metall, internal management representatives, as well as work councils and local labor unions (idem.)). They are seen as the firm’s minimum standards that need to be respected on a worldwide basis, with no cultural or legal variation, even if local skepticism may arise (such as about labor unions that are quite unusual in Peru or the demand for collection pans, safety apparel that is unusual in most parts of Asia (Braun, 2014)). Nevertheless, in order to solve this skepticism and explain the benefits of these standards in each region, Faber-Castell works closely with the international trade union and its local agents that negotiate with governments and help the firm to correctly introduce the standards in each context (idem.). And
even more, the fact that the compliance of these standards is monitored by the local and the international labor unions and management teams demonstrates a strong degree of universal and local considerations.

Besides, the three RBP forms discussed earlier (Philanthropic Behavior, Integration and Innovation), can also be observed in the case of the Faber-Castell Group. Firstly, Philanthropic Behavior through the Graf von Faber-Castell Children’s Foundation, for instance, that provides financial, material and personal support aiming children’s development through international projects (such as helping charities, hospitals and schools in BOPs). Another specific project is the “Programa Voluntários” in Faber-Castell’s production sites in Brazil, where employees can support community projects with the aim of passing on their know-how to locals such as by raising awareness of environmental issues, while being exempted from work. Secondly, Integration by including more responsible behavior in core business operations on a daily basis, such as environmentally-friendly and certified production processes, packaging and products, using renewable energy sources in most production sites, using wood from own sustainable forestry in Brazil and Colombia, environment-friendly water-based paint; modern waste water treatment systems, etc. (Braun, 2014). Internal RBP include free leisure programs for employees, as well as language, literacy or computer classes, health prevention programs and even preparation courses for university that are defined and implemented by local managers in accordance with the HQ. “This has a strong motivation effect on our employees, because it improves their quality of life which in turn results in even more dedication and loyalty to the company and helps us to avoid fluctuations” (idem.). And thirdly, a certain degree of CR Innovation is achieved by implementing strategies that alleviate specific societal problems and simultaneously create long-term benefits for the company (Halme and Laurila, 2009). This win-win behavior may even be seen through the lenses of corporate shared value (CSV) thinking, namely “policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the communities in which they operate” (Porter and Kramer, 2011, p.6). Faber-Castell’s forestry projects in Brazil and Colombia can be seen as interesting examples of this CSV strategy. In its site in Prata, Brazil, for instance, 10.000 hectares of wasteland were planted with millions of pine-tree seedlings, ensuring a secure and planet-friendly supply for the firm, while simultaneously having a positive impact on the environment. And thanks to biodiversity programs together with local NGOs, the managed forests provide a new habitat for species of flora and fauna just as a by-product (Braun, 2014). It results from this that today, almost 100% of the wood used for production in Brazil come from Faber-Castell’s own forests- a great international aim for the near future (idem.). Besides, the company’s reforestation project in Colombia is another example of this CSV behavior by saving destroyed nature in an overgrazed region plagued by floods, poverty and droughts, providing job opportunities for local
farmers and simultaneously safeguarding the company’s future raw material supply: “We have made contracts (15-20 years extensible contracts) with about 51 local farmers that cultivate and reforest land for us. In return, they receive a monthly salary, 30% of the wood revenues and of the proceeds from the sale of carbon emission credits, a bonus from the UN for projects that restrict global greenhouse effects. So with us, the farmers have a constant timber buyer which allows them a higher standard of living as well” (idem.). Yet, all these RBP are being conducted with a healthy degree of self-interest: “We want and need to make profits- but sustainable ones. The forestry projects demonstrate that all parts are benefiting from it- the company, the environment and local communities- and that is what we understand as sustainable thinking and acting” (idem.). This sustainable international business strategy is created through RBP adoption and adaptation and accompanied by long-term organizational (e.g. improved reputation, competitive advantage, resource assurance), employee (e.g. increased motivation and less unethical treatment), societal and environmental benefits (e.g. reducing the firm’s environmental footprint and achieving socio-economic community development) (Ganescu, 2012) that constantly need to be consolidated through employee and management trainings throughout the firm’s operations and communicated to internal and external stakeholders (Braun, 2014).

CONCLUSION, RESEARCH LIMITATIONS AND INPUTS FOR FUTURE RESEARCH

In conclusion, it can be argued that the Faber-Castell Group is quite an interesting case to study when investigating RBP implementation during the firm’s internationalization process to BOPs. The case study demonstrates that the definition and implementation of RBP and sustainable management practices can only be carried out by relying on strong cross-sector collaboration networks and dialogue with international/local organizations, NGOs and local management teams that pursue a profound knowledge of what is needed and understood as responsible, decent and ethical behavior in each context. Faber-Castell adopts diverse RBP forms in BOPs, combining global RBP integration and local RBP responsiveness and successful RBP adoption is the result of this behavior. The main limitation of this research is its narrow scope in terms of having analyzed one specific case only. Future research in the field of cross-cultural RBP adoption and sustainable management could therefore include a wider scope of firms. However, it contributes to the existing literature on RBP in BOPs by integrating RBP, FDI issues and international business ethics, demonstrating how corporate sustainability can be operationalized, and has practical implications as it may serve as an example for managers developing RBP in BOPs.
ACKNOWLEDGEMENTS

The authors would like to thank Mr. Braun and his team for the support and the information sources provided for the creation of the case study.

ABSTRACT

The global economy and its structure have been changing constantly throughout the last decade due to new developing economies growing in size and joining together. As a result, attitudes toward international cooperation and management are changing as well. This article aims to define the extent of interrelatedness between the economies of the BRICS countries, as well as to understand how synchronized their business cycles are and whether or not the BRICS affiliation is having additional effects from its cooperation.

For this paper, we studied BRICS countries’ GDP in constant prices for the period from 1980 to 2013, including the periods of world economic crises, in order to confirm or refute the “decoupling hypothesis” being in effect in the developing countries in the BRICS economic union. The data was examined as a time series and researched using the Hodrik – Prescott filtering technique and spectral analysis. Using the Hodrik – Prescott filtering technique, we have shown that the output gaps of the BRICS countries are not all of the same variety, and there are various different natures of production gaps in effect. Spectral analysis has shown that any synchronization among the economic cycles is insignificant. Taken together, our empirical analysis explicitly indicates that it is too early to begin speaking of corroborating the effects of the “decoupling hypothesis” at this point.

Keywords: Globalization, BRICS, Hodrik – Prescott filtering, Economics cycle, Decoupling hypothesis
INTRODUCTION

Global trade and integration is one of the main forces driving the growth of the global economy and raising its efficiency. One of the basic indicators of the effective performance of economic unions and international trade stimulation is the presence of synchronization among the economic cycles of the countries involved in such unions (Erdorf and Heinrichs, 2011; Frankel and Rose, 1998; Imbs, 2004; Papageorgiou et al., 2010).

The BRICS countries, which are related to developing markets, were chosen as the subject of our research. The economies of developing countries have grown substantially over the past decade, and they have begun to play a more significant role in the global economy (Kose et al., 2008). As a result, the “decoupling hypothesis” is starting to be discussed more and more often. (Kose et al., 2008; Felices and Wieladek, 2012; Kawai and Petri, 2014; Yeyati and Williams, 2012)

It must be noted that the 2009 crisis brought several changes in the way this issue is discussed. Before the crisis, most of the literature spoke about supporting the decoupling hypothesis (Gilenko and Fedorova, 2014; Dooley and Hutchison, 2009). Since the crisis, a great deal of research has appeared which observes a decrease or total disappearance of signs of this effect in the meantime (Dimitriou et al., 2013; Wälti, 2012).

For scientists, the most pressing topic is still globalization, and it is here that professional opinions differ, as they always have. Some work notes the presence of “spillover effects” resulting from developing countries joining these kinds of unions (Das,2010; Dooley and Hutchison, 2009), while other researchers are expressing apprehension as to the supposed positive effects of such unions (Tsheola, 2002).

In this study, we aim to research the output gaps of BRICS countries above and below their projections, and to use spectral analysis to determine the extent to which economic cycles are synchronized. A similar approach has earlier been used in regard to European Union countries in Papageorgiou et al., 2010; Frankel and Rose, 98; etc.

In the second part of this article, we used a Hodrik – Prescott filtering technique to study output gaps. This technique allowed us to discover positive and negative gaps of output in the BRICS countries. We went on to used spectral analysis to study the extent of synchronization of economic cycles. This spectral analysis was carried out based on time series of the BRICS countries’ GDP in constant price.

The third section provides and discusses the statistical results of the research. The fourth section analyzes the results and the contradictions which arose, and makes an attempt to explain them.
METHODS

Decoupling hypothesis

Before the 2009 crisis, it was possible to observe various symptoms of developing countries’ economic
cycles becoming disconnected from those of developed countries (decoupling hypothesis). However,
today, the situation has changed (Chkili and Nguyen, 2014). Countries with developed economies
have gradually become stronger since the 2009 crisis. The USA and the European Union countries are
gradually ending their policy of collective mitigation to stimulate their own productive forces,
resulting in economic growth. While this is going on, developing countries are running into the
problem of stagnant economic growth and the necessity of adapting to being in the “decrease” phase
of the economic cycle. As a result, we are witnessing an outflow of capital and devaluation of national
currency in developing markets, the markets which BRICS countries are connected with. In these
conditions, it is doubtful that we will find evidence in support of the decoupling hypothesis.

Therefore, in order to eliminate the influence of financial markets, inflation, and currency exchange
rates on the economic cycle, we chose to use GDP in constant price as the subject of empirical analysis
in our research. Macroeconomic variables (like inflation) are also in part based on the economic cycle.
This is the most traditional approach, and we intentionally did not scrutinize a large set of interrelated
macroeconomic variables.

Hodrick – Prescott filtering

Hodrick – Prescott filtering is one of the most popular ways to expand a time series of economic data
into a trend and a cycle. This expansion is crucial for us to express the output gap, the difference
between the actual and predicted GDP. The existence of an output gap indicates that the economy is
functioning at an inefficient level, using its resources either too much or not enough.

By “trend” we mean a certain steady, systematic change over the course of a long period. However, no
matter how large the series, one can never be certain that the trend is not just part of a slow oscillation.
Having set a trend apart from seasonal oscillating changes, series depict a more or less regular
fluctuation. Seasonal effects are easiest to discover, set apart, and study. Here, changes are occurring
which are applied to the system by some cyclical mechanism external in its relationship to the basic
mechanisms which define the system’s behavior.

When determining the trend, we understand that any movement observed over the course of a long
enough time will appear to be smoothed-out. This means that, at least locally, the component
Corresponding to the trend can be expressed by a polynomial of time $t$.

So, in our case, GDP is expanded into a trend and deviation from that trend (Hodrick and Prescott,
1997; Tsyplakov, 2011):

$$y_t = y^T_t + y^e_t.$$  \hspace{1cm} (1)

The Future of Entrepreneurship
where \( y^*_t \) is a trend or structural component of the time series and
\( \gamma_t \) is the cyclical component of the time series.

To get a smoothed-out series, we apply conditions which minimize the cyclical component's deviation:

\[
\sum_{t=0}^n (y^*_t)^2 + \lambda \sum_{t=0}^n \left[ (y^*_{t+1} - y^*_t) - (y^*_t - y^*_t - 1) \right]^2 \rightarrow \min
\]

where \( \lambda \) is a Lagrange multiplier. For annual data, \( \lambda = 100 \).

Then, after isolating the trend, we inspected the rest of the series using spectral methods of analysis.

**Spectral analysis**

Next, after isolating the trend, we inspect the rest of the series using spectral methods of analysis (Kendall and Stuart, 1966).

We assume that, for any pair of values, there exists an autocorrelation:

\[
\rho_j = \frac{\text{cov}(u_t, u_{t-j})}{\sigma^2},
\]

where \( \rho_j \) is the correlation between members of the time series after filtering by \( j \),
\( \text{cov}(u_t, u_{t-j}) \) is the covariance between members of the time series after filtering by \( j \), \( \sigma^2 \) is the dispersion of the rest of the time series.

The total sum of coefficients \( \rho_0, \rho_1, \rho_2, ... \) is called the correlogram of the series. By determining the correlation of the rest of the series in stages, without components of the basic trend, we can construct the correlogram, which lets us graphically trace the interdependence between members of the time series.

Then, when studying the different kinds of periodic processes (meaning processes which repeat over a defined period of time, including economic processes), the best way is to expand periodic functions that describe these processes in a trigonometric series. The simplest periodic functions are the trigonometric functions \( \sin x \) and \( \cos x \). The period \( T \) of these functions is \( 2\pi \).

The simplest periodic process is a simple harmonic oscillation described by the function:

\[
y = A \sin (at + \varphi_0)
\]

\( t \geq 0 \)

where \( A \) is the amplitude of the oscillation,
\( \omega \) is the frequency,
\( \varphi_0 \) is the phase offset.

This kind of function (and its graph) is called a simple harmonic. The fundamental period of the function is \( T = \frac{2\pi}{\omega} \), which means that one full oscillation occurs in the span of time \( \frac{2\pi}{\omega} \). The denominator \( \omega \) shows how many oscillations will occur within the time unit \( 2\pi \).
Complex harmonic oscillation, which occurs as a result of applying a finite (or infinite) number of simple harmonics, is also described by the functions $\sin x$ and $\cos x$. This way, a constant periodic function can be expressed with this system of formulas (6), (7), (8):

$$ A = \frac{2}{n} \sum_{t=1}^{n} u_t \cos \frac{2\pi t}{\lambda}, \lambda = \frac{2\pi}{a} \quad (6) $$

$$ B = \frac{2}{n} \sum_{t=1}^{n} u_t \sin \frac{2\pi t}{\lambda} \quad (7) $$

$$ S^2 = A^2 + B^2 = \frac{4}{n} \sigma^2 \omega(\lambda) \quad (8) $$

where $u_t$ is a member of the time series after removing the trend;

$\lambda$ is the wavelength;

$S^2$ is the intensity of the oscillations.

The graph of $S^2$ is dependence on the wavelength $\lambda$ is called a periodogram.

RESULT

Hodrick – Prescott filtering

Using Hodrick – Prescott filtering, we isolated the cyclical component from the trend for all of the BRICS countries. Our goal in doing this was, first of all, to find the existence of an output gap, and second of all, to track the dynamic of output gaps to determine the effectiveness of the economy’s function. The results of the smoothed time series of the BRICS countries’ GDP are presented in figure 1.

From the figure, it is clear that output gaps in the BRICS countries have fundamentally different characteristics. For Brazil and South Africa, constant stochastic oscillations around the projected value of the GDP are normal. In other words, the output gap is sometimes positive and sometimes negative. This means that the economies of these particular two BRICS countries sometimes function with excessive, sometimes with deficient use of resources.
Figure 1. HODRICK–PRESCOTT FILTERING OF THE TIME SERIES OF BRICS COUNTRIES’ GDP
India and China are characterized by a period of economic growth with a consistently positive output gap in the period from 1992 to 2005. This means that the economies of these two countries have used their resources too intensively and they are now encountering stagnant economic growth, for this reason among others. A similar phenomenon could be seen in Japan’s economy during the 1970s and 1980s, when a period of very fast economic growth was replaced by the so-called “lost decade”, a period of marked moderation and stop to economic growth. Excessively intense economic growth can not last forever. Our empirical results now tell us that the economies of India and China are now being threatened by another “lost decade”. However, it must be remembered that these are developing countries, not developed countries. Stable markets have not been established in them, and a “lost decade” may have drastic effects on their economies.

In Russia, the situation is more troubled. Russia’s output gap from 2001 on has been steadily negative, meaning that its economy is not working efficiently, not using its resources to a sufficient degree, and the global financial crisis of 2009 has only heightened this weakness. This shows that Russia has not finished dealing with the fallout from the 2009 crisis, and it won’t be easy to move on. Proof of this is the complete lack of any tendency toward reducing the negative output gap.

Therefore, we see that the output gap dynamics of BRICS countries are various, and certain coincidences can be seen only between India and China, or Brazil and South Africa. This means that we can not corroborate the decoupling hypothesis or speak about additional economic effects of bringing countries together into the BRICS union.

Spectral analysis

Next, after eliminating the trend, we did additional research into the rest of the time series. Correlograms of the rest of the time series of BRICS countries’ GDP are depicted in figure 2.
The greatest dependence among the members of these series appear to be: for Brazil, members 5, 9, 10; for South Africa, members 13 and 14; for India, 8 and 9; for Russia and China, the chart appears flat. So, the graphs have different shapes and different natures, and there is not much correlation between them. As a result, the most intense oscillation in these remaining GDP time series will most likely be in those years with members of the time series with the most correlation. To confirm this, we have shown periodograms of these time series of BRICS countries’ GDP in figure 3.

Figure 2. CORRELOGRAMS OF THE REMAINING TIME SERIES OF BRICS COUNTRIES’ GDP
From the periodograms, we can see that, in South Africa, oscillation around the base trend occurs at 2-year intervals. In Brazil: 3 years. In Russia: 1.5 to 2 years. This correlates to oscillations in economic activity, which are connected with capital markets. India and China again confirm the conclusions which we made in the previous section.

On the whole, the results show that synchronization in the BRICS countries' economic cycles is minimal, and we can not find evidence of the decoupling hypothesis.
DISCUSSION

Our research has show that the BRICS countries have different output gap dynamics, which prevents us from confirming any significant level of synchronization in the economic cycles of the BRICS countries and, as a result, prevents us from supporting the decoupling hypothesis.

Despite this, our research goes well with the existing paradigm of research on this topic. Before the financial crisis of 2009, there was an environment of fast growth of developing countries’ economies, especially Asian ones (Kose et al., 2008; Felices and Wieladek, 2012; Kawai and Petri, 2014). Most researchers found evidence of the decoupling hypothesis and spillover effects in their research (Das, 2010; Dooley and Hutchison, 2009 Gineko and Fedorova, 2014). However, the global crisis of 2009 changed the trend (Yeyati and Williams, 2012) and research has begun to show more and more evidence of reduction in the decoupling hypothesis and spillover effects since the 2009 crisis.

Our research also indirectly supports the results of those other researchers who have noted a substantial decrease in the decoupling effect after the 2009 crisis (Dimitriou et al, 2013; Wälti, 2012).

In addition, the research shows that, in order to improve the efficiency of the economic union, the BRICS countries must first solve their internal structural problems.

CONCLUSION

We have done research on the level of synchronization in the economic cycles of the BRICS countries. In doing so, we used two methods: Hodrick – Prescott filtering and spectral analysis. By using Hodrick – Prescott filtering, we discovered the varied nature of the output gap dynamics of BRICS countries, which allowed us to conclude that the economic cycles are not sufficiently synchronized and that the decoupling hypothesis can not be supported at this time. Spectral analysis yielded similar results.

In the future, we plan to examine the BRICS countries’ cooperation using other macroeconomic variables.

The Future of Entrepreneurship

INTANGIBLE ASSETS AND FINANCIAL PERFORMANCE OF RUSSIAN COMPANIES LISTED IN MOSCOW STOCK EXCHANGE

Mezentceva, Ann V.; Mezentceva, Olga V.

Institute of Material Studies and Metallurgy, The Ural federal university named after the first president of the Russia B.N. Eltsin, URFU, Ekaterinburg, Russia

ABSTRACT

One of the central problems of the global economy is the issue of attracting investment into different sectors of a national economy. The presence of intellectual capital among an enterprise’s assets is a substantial factor in attracting investment. This article researches how the size of an enterprise’s total stock revenue depends on intellectual capital’s share in the structure of the company’s assets. The model was based on data collected from the accounts of 41 public Russian companies, all of them part of the Moscow exchange. In this study, we operated on the assumption that the presence of intellectual capital would have a positive effect on the financial results of Russian companies; however, in the early stages of our research, we could not find a linear relationship between intellectual capital and financial results. Only deeper and more detailed analysis, based on non-linear regression models, led us to evidence supporting the positive correlation.

Keywords: investment, foreign direct investment, intellectual capital, intangible assets, total comprehensive income.

INTRODUCTION

An enterprise is an open system and, to better understand the factors of growth and development, any changes must be monitored by managing entities. Financial statement analysis can say a lot about an enterprise’s activities (Kaplan, and Norton, 1992). An enterprise’s financial analysis, lending an understanding of general economic tendencies, permits evaluation of such macroeconomic problems as: low level of international investment, capital withdrawal from their country, minimal levels of innovation, lack of competition, and stagnation of small businesses. In other words, it helps to evaluate everything intrinsic to the Russian business model of today.

In the global economy, one of business’s key drivers for success is innovation, along with intellectual capital. (Harlow 2013, Tan et al., 2007, Amin et al., 2014). Measuring innovation processes (Boly et al., 2014) and value creation through intellectual capital (Shakina and Barajas, 2014) are beginning to be
discussed more and more in research literature, as well as evaluating the effects of intellectual capital on a company’s activity. (Kim, S.H. and Taylor, D., 2014)

Intellectual capital’s effect on financial performance of companies is still an open question for developing countries. This is why most researchers are trying to find and evaluate the relationship between these factors (Tan et al., 2007, Amin et al., 2014).

In Russia, an enterprise’s bookkeeping is characterized by the near impossibility of exposing the amount of intangible assets, intellectual capital, and innovation, even in the most open and public companies. They are reflected in the consolidated accounts under “non-current asset”, “goodwill”, and “participation in joint-stock capital”. This is why, in our calculations, we used the value “non-current asset”, which in some instances included the value “goodwill”. In this work, we also tried to find a relationship between the value of intangible assets and the value of total revenue in 41 enterprises. The enterprises were selected from all companies listed in the Moscow exchange.

This article presents the results of an attempt to find an exponential relationship between values. Our analysis has shown that there is no logarithmic relationship between the analyzed data; a further analysis was carried out and a sinusoidal relationship was exhibited.

METHODS

Data and accounting of intellectual capital in Russia

In our research for analyzing the effects of intellectual capital on financial performance, we used annual consolidated financial account data of Russian companies from 2010 to 2012. We examined the information of 41 open public companies listed in the Moscow exchange, and its constituents the MICEX Index and RTS Index, which regularly publish their financial accounts by International Financial Reporting Standards or US GAAP.

International Financial Reporting Standards (IAS 38) allows advertising expenses, training, research and development expenses to be considered intangible assets. The goal of research and development is to acquire new knowledge. To be considered an asset (including intangible assets), the International Financial Reporting Standards require the following criteria: identifiability and oversight. An intangible asset must also be nonmonetary, without physical form, and capable of yielding economical benefits in the future.

International Financial Reporting Standards allow the following to be included among intangible assets: lists of clients, market knowledge, technical knowledge, uncompleted R&D, and other similar assets. This substantially expands our understanding of intangible assets. According to Rule GN8.12 of European Valuation Standards, regardless of whether they are reflected in the balance or not, intangible assets can be divided into two categories:
goodwill (unidentifiable intangible assets),

identifiable intangible assets.

It is recommended that “goodwill” be evaluated as a whole number, by means of converting surplus income into capital. Surplus income is defined as “rent goodwill” or economic gains. This means that “goodwill” is equated with capitalized economic gains.

In this way, the total comprehensive income should theoretically be connected with the worth of an enterprise’s intangible assets in a directly proportional manner.

In the accounts of several companies examined, the “goodwill” index is expressed within the index “intangible assets”, and as a result, in our calculus we used the sum of intangible assets and goodwill if they were expressed separately in the accounts. This was done so that the data for analysis would take an analogous appearance. In this way, we used the coefficient \( \gamma \), which shows what portion of the enterprise’s overall assets is taken up by intangible assets and goodwill. It is important that the enterprises can be compared using this coefficient.

The index — allows us to evaluate the profitability of an enterprise’s actions and can also be compared with indexes of other companies.

Description of sample

In our research, we examined the financial accounts of Russian companies over the period from 2010 to 2012. Russian companies have only recently begun the practice of indicating intangible assets in their accounts. We found ample evidence that absolutely no intangible assets were accounted for in Russian companies’ bookkeeping from 2010 to 2011. For this reason, we were forced to examine only data from 2012 in our model. Obviously, this limited the results of our research somewhat.

The second limiting factor was that we have been examining companies which are included on the Moscow Stock Exchange, but which belong to different fields. It must be noted that all publicly-traded companies on the Moscow Stock Exchange are “flagships” of the Russian economy, meaning that they are the leaders of their fields in terms of assets, capitalization, and profit. We did not examine small and middle-sized businesses due to these enterprises’ data being inaccessible. The general distribution of our data grouped by economic sector is presented in table 1.
Regression analysis

In this way, we acquired sets of comparable data from 41 companies. We ran a regression analysis to discover the link.

The independent variable (X) was the portion of intangible assets in total assets, and the dependent variable (Y) was the portion of total comprehensive income for the year in revenue. A graphic depiction of the relationship is presented in figure 1. The relationship between the X and Y variables is portrayed as points on the coordinate plane (X,Y) and form an empirical linear regression Y of X.

![Graph](image)

**Figure 1. Regression model showing the dependent relationship between X and Y**

Basic assumptions:

1. Let the following formula be true

\[ Y_t = a + bX_t + \varepsilon_t, \tag{1} \]

where \( t = 141 \) is the number of factors in the sample being examined

<table>
<thead>

</tbody>
</table>

Table 1. *DISTRIBUTION OF DATA BY ECONOMIC SECTOR*
\(X_t\) is the deterministic variable
\(Y_t\) is the dependent variable
\(a\) is a constant
\(b\) is the slope of the line
\(\epsilon_t\) is the deviation

2. \(E\epsilon_t = 0\), the value of error \(\epsilon_t\) is mathematically expected to equal 0;
3. Error \(\epsilon_t\) has a normal distribution when \(t = 1.41\)

We can calculate the values of regression of \(a\) and \(b\) using the method of least squared, as in formulas 2 and 3.
\[
b = \frac{n\sum x_t y_t - \sum x_t \sum y_t}{n\sum x_t^2 - (\sum x_t)^2}, \quad (2)
\]
\[
a = \frac{1}{n}\sum y_t - \frac{1}{n}\sum x_t b \quad (3)
\]

We tested our hypothesis \(H_0: b = b_0 = 0\) using the standard criteria of linear regression: Student’s t-test and F-test.

As is obvious from figure 1, a linear approximation is unlikely to give good results. We decided instead to test other kinds of dependency, specifically logarithmic and sinusoidal. We incorporated these types of relationship into a linear one, using formulas 4, 5, and 6.

\(Y = AX^b\) \quad (4)

By making a logarithm of both sides of the equation, we can bring this relationship into a linear form:

\[\ln Y = \ln A + blnX\] \quad (5)
\[Y = \sin \phi_0 + \beta \sin X\] \quad (6)

**RESULTS**

An analysis of the correlation helps to discover the trend and level of interrelatedness between two variables. The results of regression analysis by linear, logarithmic, and sine models are depicted in table 2.

</tr>
</tbody>
</table>

**Table 2. STATISTICS OF REGRESSION**

From table 2, it is clear that the best approximation of the data occurs when using a sine-based model of dependency. However, we also see that the R-squared and F-statistic are very small. This implies
that we probably can not describe any kind of relationship between the data.

Since we received results which correspond poorly with the existing research (Lev et. al., 2009; Cohen and Vlismas, 2013), we tried to partially remove the limitations caused by examining enterprises from different fields by building a linear regression model specifically for the metallurgy sector of the Moscow Stock Exchange. We chose metallurgy because it is connected to the largest number of enterprises on the Moscow Stock Exchange. The results of this model are presented in Table 3.

</tbody>
</table>

Table 3. RESULTS OF LINEAR REGRESSION ON THE METALLURGY SECTOR

Although the R-squared value in this model seems much more ideal, the relationship between intangible assets and financial performance turned out to be opposite.

From an economical point of view, these results help to understand that innovation in Russian enterprises carries an administrative character, rather than a market-based character. At this time, an enterprise’s innovative activity and its intangible assets, including intellectual capital, do not have an effect on its generated income or its ability to attract investment in stocks. These results are not standard, and they are related to the unique features of Russia, as most research on the topic does succeed in finding a connection between intellectual capital and public corporations’ revenue. Another factor which has a substantial effect on these results is the lack of a developed institution to protect intellectual property in Russia. In practice, most companies do not need to commercialize the results of their innovative activities. This leads to intangible assets being absent from the consolidated accounts, and this information is instead incorporated into “investment in associates and joint ventures”.

DISCUSSION

The results of the research demonstrated no connection between Russian enterprises’ intellectual capital and their financial performance and ability to attract investment. This result is unexpected, given the background of the Russian government’s attempts to stimulate innovation and raise direct investment into Russia’s economy. In addition, most researchers recognize a positive connection between intellectual capital and the success of enterprise activity in other countries in the global economy (Amin et al., 2014, Manolopoulou and Tzelepis, 2014). It is important to note that up to 70%
of successful innovation in the world is achieved through the lens of the Demand-pull hypothesis (Nemet, 2009). Russia is a developing country with a significant share of raw material exports. It is possible that modern Russian enterprises have neither the experience nor the culture of innovation and asset generation in their knowledge base. This is why the market of direct investment in Russia is represented largely by companies in the raw materials sector of the economy, which has a low level of innovation and intellectual capital.

CONCLUSION

We researched the relationship between intellectual capital and financial performance to better understand how public Russian companies attract investment. Based on data about the portion of total assets taken up by intangible assets and about the value of total comprehensive revenue for the year for, we created different models of dependency, specifically: linear, logarithmic, and sine-based. We came to the unexpected result that there is no connection between intellectual capital and financial performance in Russian enterprises. In the future, we are planning deeper research into the reasons for this connection’s absence.

A NEW WAY OF BUSINESS THROUGH THE EUROMEDITERRANEAN MODEL

Micheletti, Patrick

KEDGE Business School

ABSTRACT

The transformation of the model of management is mixed because it is based on economics concepts where the viability and the success of a good operation remain the concern first but also the continuity of the richness represented by human resources. It’s the reason for which we can affirm it can have a bringing together with the managerial practices of Arab countries and those of Europe like France. According to the preceding approaches on spaces of thinking, the Euro-Mediterranean model can be conceived like a space of directions:

For geographical reasons, even if the limit is fuzzy: thus, East and West of the Mediterranean sea can be considered like good examples for this demonstration due to different but similar things like the way of life, the landscape.

For historical reasons: philosophical, scientific bases and policies of the occident, primacy of economic flows until the end of the 19th century.

For sociological reasons: (strictly speaking) the Mediterranean way of life and thought (role of the community, research of the humanistic proximity, impacts of futility, logic of resistance) and with the historical Mediterranean pressures (frequency of the crises, interbreeding) but also (substantial rationality, diversity, accumulation and growth) and with the European historical pressure (constitution of an unique economic area).

For economic reasons: the permanent juxtaposition of levels of different richness and growth. This constitutes a first framework of the Mediterranean new model because we also notice that we not have opposition between North and the South, West and East; they offer a real possibility of bringing together and a mutual empowerment, and not antagonism.

They offer no catch to dichotomy North/Modernity/Industry and South/Tradition/Land, That they can only to enrich our vision and our approach economic by market.

That they make it possible to defuse the trap of the “Mediterranean values” whose contents (often fixed) cause dispute, schematics to the profit of the description of process authorizing the differences. To reason in term of process as enables us to approach management more easily as the contents of the values of th Euro-Mediterranean positioning and management.
TRACKS FOR A METHODOLOGICAL FRAMEWORK

The project: what characterizes the transformation of the economic and business model; it is the extraordinary variety of situations which make its apprehension complex and consequently any difficult intervention because of the singularity of each element being treated in particular with different and unbalanced methods of approach. One could, to even say that it is also what makes its interest because each challenge to take up will be proportionally more difficult compared to traditional situation. Initially, one can thus affirm that the operators intervening in the transformation of business to be not only voluntary and courageous but that they require should moreover surmount obstacles additional and specific to each type of situation. The complexity of the business which one finds in particular at the time of the transformation of the structure grows because of the multiplication of the variables and uncertainties to be taken into account in all the situations of business. From this complexity, we can be directed while betting on a complexity distributed on human complexity on all the levels. The organization of a cell project with a head of project identified and legitimate with a clear communication resting on in-house partners and into external (Businessmen, trade unions, consultants). The interactive connection between the signal business and the base cannot set up to leave from a head project or a cell project clearly identified. We do not mobilize the staff on strategic stakes starting from the emotional reaction on the importance which represents the weight of a decision and the consequences which result from this by making brief surveys or by forcing a dominant ideology to make adhere the staff and to mobilize it on the importance questions or of survival. The role of a head of project representing the connection between the customers and the signal business constitutes the first steps of a system which implemented in the duration and which aim at ensuring stability of the method and to consolidate each individual in his role of person in charge that can emit opinions or make constructive proposals. The principal goal is to crystallize around the head of the whole project of information which can play a determining role in very decision-making by taking a real decision, while classifying and while choosing what will be the strategic major importance and what concerns the second order. It is significant to specify that the head of project endorses a considerable responsibility because of his role and the decisions which are or will be taken thereafter.

The strategy: the transformation of the business model is mixed because it is based on economics concepts where the viability and the success of a good operation remain the concern first but also the continuity of the richness represented by human resources. It’s the reason for which we can affirm it can have a bringing together with the business practices of Arab countries and those of Europe. Each decision in the process of transformation implying the staff is the result of interactive connections intern and external through which the business policy is organized for the attack of objectives aiming
at satisfying in priority the interests of the shareholders. From this point of view, the evolution of the managerial practices centered on the policies of human stock management encounter real difficulties between the divergent interests of the shareholders in search of profitability in the short and medium term and the requirements of the professional life in the long run in particular on the fact of preserving the employment as long as possible. The results reached are thus the representation of these two types of connections which one can qualify "A feel single" insofar as the authority in the business will be exerted fully or "A double feel" insofar as this authority is lit and helped by the base. In fact, the two types of connections belong to a more complex unit including the environment by the signals of the market into external (emission) and the behavior of the in-house actors characterized by the attitudes and the reactions compared to the signals (reception). Located at the borders of the strategy of the firm, antagonisms of connections reveal various positions that is necessary to try as well as possible to combine interests of each part because of the essential principle of survival of the firm duplicated of the will of the managers to preserve the employment by developing the activity characterized mainly by the turnover. The interactive connections between the strategy of the firm and the policy of human stock management thus depend fully on the moment (time) and the place (space geographical: room, regional, national or foreign) in which they will be exerted. Thus, it is of primary importance to hold account in order not to be in permanent shift between the possibilities offered on activities, markets, outlets or quite simply of the scale economies related to the only fact it is more interesting to rationalize the costs by transferring them for example on others places of production and the requirements of profitability which are increasingly related to the human capital.

**HOW TO DEFINE A SPACE?**

To speak about the Euro-Mediterranean concept is a point of identification for a space in which the subsets political, sociological, and organizational (and why not geographical, physical, climatologic...) have behaviors different from the same subsets in others spaces.

Thus, it seems possible to call upon the most recent work of geopolitics, and in particular those led by different authors in economics and management. They show a process of delocalization of the direction, fruit of acceleration of universalization and a new way of modernity, in a measure where we do not lead to a return towards the tradition. Their ways of thinking stay initially on the development of the plurality to the world level, which is declined on four axes:

- The decentralization of the modernity, which is not more European or euro-American. That is explained by the disappearance of the historical aspects (colonial world), economic or symbolic system (authority).
- The dissemination of the authority because "there is difficulty by thinking a political, social or cultural phenomenon from only one actor or from only one leader (State, religion)"; this dissemination leads to a "double pluralism: pluralism of the systems of direction and pluralism with inside of each system of direction ".

- The rise of the relativism, like consequence of the preceding dynamics, but also by the philosophical dispute of universality to which we can oppose incommensurability by an increasing complexity that general dynamic vision cannot restore and by the refusal of the rejection of the egocentrism.

- The new kind of the honor of the nations, related to the end of a vision of the world in opposite blocks (fine of the cold war) allowing the primacy of the business and cultural (with the detriment of the ideology): Today it’s through the market that the" virility "of the nations is expressed”.

After the structural factors identified, we are interested in the contents of spaces of direction as the place where three dynamics tangle up:

- The installation of a deliberative space in which can act the public or private actors. in order to pose and solve problems calling of the common solutions to this space…

- The production of "collective" and specific preferences to this space in the world game

- The capacity to convert these preferences and these deliberations into political performances…

Thus, we will qualify this space of direction any space able to answer simultaneously the conditions of deliberation, by enunciation and performance such as we have just defined them.

Without entering in a radical criticism of the definition of the space of direction, we note that its institutional dimension leads us to analyze the contents and the impacts of regionalization only through political constructions (European Community), religions or geographical spaces. We notice as well as the Euro-Mediterranean model does not enter any of these categories, but it doesn’t reject anyone. Thus, a finer investigation remains necessary.

**THE BEGINNING OF THE EURO-MEDITERRANEAN MODEL OF BUSINESS**

According to the preceding approaches on spaces of thinking, the Euro-Mediterranean model can be conceived like a space of directions:

- For geographical reasons, even if the limit is fuzzy: thus, East and West of the Mediterranean sea can be considered like good examples for this demonstration due to different but similar things like the way of life, the landscape.
- For historical reasons: philosophical, scientific bases and policies of the occident, primacy of economic flows until the end of the 19th century.

- For sociological reasons: (strictly speaking) the Mediterranean way of life and thought (role of the community, research of the humanistic proximity, impacts of futility, logic of resistance) and with the historical Mediterranean pressures (frequency of the crises, interbreeding) but also (substantial rationality, diversity, accumulation and growth) and with the European historical pressure (constitution of an unique economic area)

- For economic reasons: the permanent juxtaposition of levels of different richness and growth: Euro (money) is a quasi-perfect example of integration of diversity, for reasons of sustainable development predicting a common future:

Europe Community constitutes the greatest world fresh water reserve; blue gold becomes one of the major stakes of the geo strategy and an Euro-Mediterranean vision is essential, less than one hour of plane separates the European Union (GNP/inhabitant highest) and Africa. In fact, geographical space materialized by the Mediterranean Sea between the "rich person" and the "others".

While remaining voluntarily in the management approach, we see that there is matter to constitute a space of direction, since if we disregard (for the moment) public / institutional dimension, we find conditions of deliberation (in particular on the level private operators), of stating and performance. To further go, to materialize this space of euro-Mediterranean direction, implies to find identity marks.

We must move towards the definition of the euro-Mediterranean which rests: - on European specificities, which are compared to the United States: economic conflict political competition and incompatibility of the social models. - On approaches resting "on a kind of praise of heterogeneity? to substitute in the State of right of the "States of the rights" orchestrating diversity of the allegiances and the human memberships in order to differently treat them within companies in diversity.

The goal is to assure the accomplishment for each one individually by not forcing anybody to be detached or disavow its fasteners and while basing themselves precisely on these bonds, from the point of view where each one would be removed from the artificial yoke generated by the "homogenization".

On the capacity to identify "clean" interests, being able to involve divergences within the European Union including on what seems the Truth. Thus goes from there it of the concept of single market, considered by English as having to be most open possible on free of exterior so that it is based in an immense total market "the Mediterranean countries insist that the single market marks its identity with respect to outside, in particular by mechanisms of control". To define a space of euro-Mediterranean direction would not amount it proposing a political humanism resting on three bases:
- ontological equality in dignity, which seeks to be carried out through equality of the rights and the conditions, right conferred on each one to take part in the definition of the collective destiny like carrying out its individual destiny;
- the freedom, concretized in the individual conscience and the independence of mind, the distance kept vis-à-vis the communities of membership, the separation of the private and the public;
- the knowledge which means the dissociation of the knowledge and the ignorance, the knowledge and the capacity; the disclosure of the knowledge to all; the permission to doubt and call into question; the permanent possibility to transform the world with the risk of error;

"the European universalism taken within the limits of our thinking and our knowledge, cannot completely include all philosophies European economics policies, whereas it appears more relevant for the Mediterranean nations of in relation with Mediterranean countries and further to exchange practices in management which could be very useful for everyone.

In this context the business model is designed to answer a series of questions essential to any business – who are the customers, what do they value, how that value can be delivered to the customer at an appropriate cost and how the business deploys its assets. It includes a description of the key assets, both physical and intangible such as intellectual property, governance structure and management. It consists of both a narrative of how the business works and the numbers – how it makes a profit. The concept came into vogue when the spreadsheet provided an easy way to test the financial implications of the narrative in a financial model which contained assumptions about costs, product demand, sales revenue and profit. The financial outcome of changes to the narrative, or assumptions about product demand, etc. can be tested in the spreadsheet model (Margretta 2002).

One reason for the popularity of the concept in the new economy, appears to have grown out of the need for the emerging dot com firms to have a comprehensive, but standard format, to explain to potential investors ‘how they were going to make their money’. The value proposition of dot com firms typically involved an innovative service or process for attracting a customer base. The proposed business model was often radically different. Often there was no precedent, no business experience, for instance, on which to base likely demand levels.

This constitutes a first framework of the Mediterranean new model because we also notice: - that we not have opposition between North and the South, West and East; they offer a real possibility of bringing together and a mutual empowerment, and not antagonism.

They offer no catch to dichotomy North/Modernity/Industry and South/Tradition/Land,
- That they can only to enrich our vision and our approach economic by market
- That they make it possible to defuse the trap of the "Mediterranean values" whose contents (often fixed) cause dispute, schematics to the profit of the description of process authorizing the differences.
To reason in term of process as enables us to approach management more easily as the contents of the values.

We can also see the arab business model from the strong point of it: the Islamic finance. In fact, the islamic arab business has proved to be a resilient system based on the basic principles of transparency and fairness in business, for example during the financial crisis which started from the US and hit. The resilience of Islamic financial institution is due to the unique business model which will continue to be different from the conventional banking due to its nature being the asset-based approach for each dealing.” Overwhelming majority of businessmen see an asset base a starting point for each and every deal making this business much secure, transparent and open for investors and bankers. We don’t believe in imagination as physical presence of assets is a basic ingredient for Islamic banking as this very basis has provided strong protective layers to each and every business in this industry, The Islamic banking industry also faced numerous challenges such as harmonization of Shariah standards and strict adherence to the basic principles of this type of banking while competing with its established peers called conventional banks.

The growth pattern and acceptance of the Islamic banking has been a hallmark behind the sustained growth of the Islamic banks and the financial institutions. This trend will be a ladder for achieving excellence for the entire Islamic banking industry in years to come.

THEREBY, WE CAN PROPOSE THE EURO-MEDITERRANEAN BUSINESS MODEL

Last approach of the prism: what can we do on the level business and research, by supporting us obviously on what we think and by locating us in logic of complementarities at the Anglo-Saxon model?

To create a euro-Mediterranean thought around business must lead us to a thought on diversity and complexity. This one is very present since several works were built on the same report: the difficulty of the neo-classic model dominating to account for the choices of the economic actors. This is not new in the sphere of management. A fast reference to the work it possible to recall that this we had identified several types of management that we briefly recall:

The Anglo-Saxon model with the dominance of business, competition, profit, individualism.

The Japanese model: growth, quality, integration, agreement,

The Euro-Mediterranean model: Management “in between”, people, internal negotiation, diversity

This approach of diversity is found in several disciplines of management. Some examples: - "To be together, firstly it’s probably to make together. It is necessary to clash with the complexity and the
construction of the future by the creativity, by the collective mobilization of the intelligence. That also means that it is imperatively necessary to rehabilitate the postulate of the specific one, of the locality and of immediately reaction, by combining them. It is necessary to support microphone-spaces of creation of the direction ".

Us plunged not only in one problems of the direction, but also in a new vision of management. The return to specific, with the room is a differentiation marked compared to the Anglo-Saxon model homogenizer.

These capacities must be like the capacity maintains a coherence of Organization between its organizational dimensions intern and external ". Even the financial managers are interested with diversity. We will also note that the transverse approaches of the managerial problems have very as a finality to better locate and better to include/understand diversities of the organizations and the actors the component (management of SME, governance, impacts of the TIC, durable development of the firms, social responsibility, quality, management of knowledge, innovation?), and this in order to better act. Taking account of:

- In the ethical plan, like paradigm interpretation legitimates evolutions;
- and on an emotional level, like horizon, desirable sign of the future ".

In fact : Euro-Mediterranean business has like field:

- the examination of the managerial practices of the companies and the men whose acts have as life or a starting territory the "areas" of the South of Europe, of the North of Africa and west of the Middle East. This geographical framework legitimates the conceptual roots of the euro-Mediterranean model but does not reduce the studies and the applications to this territory: we think that all the areas of the world are marked in their history by diversity, that all the decision makers, interested by an enrichment of the Anglo-Saxon model, must be integrated in a euro-Mediterranean approach. It is necessary to keep with esprit an opening on the Latin America, on the Chinese or Indian regional approaches. We could even think of Japan which modified its model insertion in Asia by giving up the metaphor of the flight birds (linearity, uniformity, Cartesian logic of the movement) for that of Symbiosis (diversity, harmony across the differences).
- Problems of pedagogy and research centered on specificity, diversity, the locality to have a more relevant systematic approach of the complexity of the organizations and their actors. The potential which is in front of us is huge. Thus, it seems to us that the Mediterranean approach (sea coast coastal traffic proximity) compared to Anglo-Saxon approach (ocean vastness) allows a thought on the decision-making. If we not regard the latter as step rational optimization under identified constraints, but a choice taken in a more or less reduced context of uncertainties, it seems that we can explain that:
The reduction of uncertainty for the Anglo-Saxons, confronted with the vastness and the lack of reference mark, passes by modeling and the very formalized contract, sources of homogenizing procedures,

- The space proximity offers to Mediterranean possibility of return (logical of experimentation more accentuated than modeling) and a permanent monitoring (less contract).

- The creation of grids of analysis and the actions leaving a ethnocentric vision the world and management, and making it possible to differently solve problems of survival, of development of the men, organizations and nations where the euro-Mediterranean world legitimate by its is lived of the crises and the conflicts and also by the solutions that it brought throughout its history and which it will continue to propose. The sustainable development of the firms and the nations can be conceived and be built only on one history. The Hofstede dimensions do not directly predict any phenomena or dynamics. Applying them to make sense of what happens in the world always has to take into account other factors as well as culture - notably national wealth, history, personalities, and coincidences. There is no quick fix to understand social life after taking a dose of Hofstede. But the dimensions, when well understood, do allow to predict a little better what is likely to happen. And they become more useful as you go from the specific case to the trend, average, or expectation. For instance, knowing about culture hardly helps to predict what car you will buy - but the trend among your compatriots to buy certain types of car in the coming years can be predicted fairly well. In the case of the business Mediterranean model we can involve the differences of culture in order to gather the best way to trade and develop business whatever the differences and the length of cultures.

The Hofstede dimensions of culture are group-level constructs. Dimensions of national culture are about societies; dimensions of organizational culture about organizational units. Neither is about individual differences between members of society or organizations. Comparing survey responses between individuals does not yield similar patterns to the cross-population comparisons on which the Hofstede dimensions are based. This kind of issue is known among scholars as the distinction between levels of analysis If we take into account the Islamic financial model we can find the basis of the system according to one item from the system:

**RECONCILING PUBLIC AND PRIVATE PARTNERS FOR OPERATING AIMS**

According to their culture and know how, public and private partners have different expectations and aims for their own performance. Nonetheless, they are obliged to be agreed on the Essential.

Public partners are under pressure to improve the wealth both for citizens and companies by selecting areas of the most urgent needs and by helping everyone to be involved with their point of view and in action.

The Future of Entrepreneurship

Private partners are looking for business with the highest profit and the lowest risk in order to be in the good agreement with shareholders in spite of many problems of employment supported mainly by public partners.

Thereby, how reconciling the two partners in keeping their aims by creating a new way of cooperation without being in arguing?

Before, we have to precise that public partners are evaluated by the vote of the electors and private partners by the vote of the shareholders. Both are periodically on the way to accept many hard conditions to survive.

Therefore, the first point and prior idea for each one is to preserve the status of its position to maintain themselves or simply to exist.

Personal relationships and continuity are serious issues notably in the vision where everyone expects in the improvement of what they can realize for both citizens and companies.

In other words, each one try to be the leader to renew the management to satisfy their voters but in reality they blocked each other.

The only issue of this question is to modify relationships between the two partners as so to find another sense of performance. This is a real challenge to use differences as « checks and appropriate size » to achieve public and private purposes. This requires negotiating the structure of what they want to do in advance.

The results of such negotiations reflect the power of each partner in outside the partnership; the main advantage is the creation of a balance of power for the partners.

If we would stay on the idea that one of them is more powerful than the other one, we can create nothing with this basis. By the way, it’s another idea of partnerships instead of having competitors with the aims to still get more and more, the partners become unified for operating aims. We completely change the message towards citizens and companies. Then, we enter in a strategy « win and win ».

However, to ensure relatively fair partnerships, public partners should not overtake their power in transforming it in a judgment of each situation they set up and private partners should be in a position sometimes to understand and to accept the public policy in favor of companies.

Negotiation in detailed terms such as those can plainly mean that on a hand, the new partnership costs by the involvement on another hand, the partnership make benefits for everyone because the balance is earned and the results can be measured.

The object relates mainly to the advantages which the private and public partners can mutually bring while ceasing looking itself like competitors.
They have to gain while collaborating on joint projects instead of systematically seeking to remain on closed aspects relating to their prerogatives. In other words: why not to make so that the public and private partners lay down common objectives in order to reach a decisive advantage for those which they represent and often are find themselves in the two camps. for example: we can belong to the public sector and to be interested by the results of the private companies, just like we can be in a private company and be interested in the performances of the public sector. In short terms: each sector is complementary especially if there are jointly laid down objectives.

We have to explain: operating aims:

In the private sector: companies need many services from public sector: for example education, transportation, social services, country services like water distribution, energy

In the public sector: citizens and civil servants need activities, profit, employment from companies

Then: If we consider that the sectors are in competition and completely different each other we can fall the success for everyone in the country. That’s to say: collaboration is possible for the two sectors in order to succeed.

In transportation we can have both private and public companies on the same markets.

In this context, each company can make profit and create employment if the organization of transportation is discussed and share in the sense of the passenger.

In that example, we see the real advantage for everyone: shareholders, citizens, government, civil servants.

Then operating aims are agreement in competition organized in order to give advantages for everyone.

But we can think competition is wrong in this aspect of negotiation.

It seems to be true if we forget that government and mainly European Community is the keeper of competition in every country of EC.

It’s a kind of guarantee to recognize aims like genuine and real systems of cooperation between the two sectors.

In this context, we can accept a new economic and political agent represents by European Community. The third agent is for citizens and companies the real issue of their own aims.

INTEREST RATES LIBERALIZATION OR ECONOMY CONTROL- THE CASE OF THE CHINESE BANKING SYSTEM

Mihai-Yiannaki, Simona1; Rios-Morales, Ruth2

1Department of Accounting Economics and Finance, European University Cyprus, Nicosia, Cyprus
2Centre of Foreign Affairs and Applied Diplomacy, Zurich University of Applied Sciences, Switzerland.

ABSTRACT

The Chinese Central Bank decided on June 8th and July 6th, 2012 on the duplication and consecutive cut of the deposit and loan interest rates, together with the simultaneous loosening of the interest rate floating range of their financial institutions. Unquestionably, these measures resulted in a drastic change of the operating strategies of the whole banking system, for both nationalized and the private commercial banks.

The paper aims at following up on the causes and effects of these decisions in the Chinese banking arena, predicting a higher possible level of bad loans and followed by a higher systemic risk due to the major thee banks reaction and copy-cat decision in fixing interest rates.

The research methodology is utilizing the GARCH (1,1) model and the VaR to identify the way the interests are adjusted and study if this decision was towards a real liberalization or rather a controlled interest rate change by the authorities.

Eventually, the Chinese interest rate liberalization bring with it good and bad news to the economy, while the essence remains in how such liberalization is handled and what is it aimed for the entire economy.

Keywords: interest rates liberalization, GARCH model, VaR, risk management, commercial banking, China, economic models, central bank, emerging economy

INTRODUCTION

The term structure of interest rates, determining the relationship between yields on a bond and time to maturity, but also access to credit, and monetary policies, plays a fundamental role in economics and finance, including also in the derivatives pricing, hedging, and risk management (Hong et al, 2013).

The BOC (Bank of China) was the 3rd of all four, prodigious and nationalized commercial banks of China that was listed on the Chinese mainland and Hong Kong Stock Exchange since 2006. The development of BOC was under the influences of both government policies and of the financial market, factors which led to a number of calculated acts, the nature of which was determined to be imperative, in order to successfully adapt not only to the financial development and to the government policies, but
also to increase profitability and to attain a potential risk decrease in order to become more profitable and competitive worldwide.

Richard Harris (2014) an Interment fund executive in Hong Kong mentioned that the Chinese government’s world-record US$4 trillion of foreign reserves could back local government borrowing, but this is not cash with which to pay off irresponsible debt accumulation. The aim of this research was to investigate Chinese interest rate liberalization, especially the way interest-rates adjustment affected the development of BOC, through the analysis of BOC’s returns, risks and stock price and consequently be able to provide certain recommendations for the banking system. In this respect, we have looked into the following aspects:

• The impact of interest rate on profitability
• The effects of interest rate on stock price
• The influence of interest rate on risks

For bringing the study and its results closer to the readers, we adapted the paper structure, presenting first the methodology, then the literature review supporting directly the results analysis, followed by conclusions, recommendations, study limitation and further research., references and five appendices including the calculations of the models selected for this research.

METHODOLOGY

Our process of sample selection using secondary data analysis (Sekaran and Bougie, 2010) uses the following defining elements:

1. One-year deposit and loan interest rates, overnight Shanghai inter-bank offering interest rate, quarterly NII and equity of three banks: BOC (Bank of China), CCB (China Construction Bank) and CMBC (China Merchants Bank), and their daily stock price and turnover sourced from these banks’ websites.

2. The size of the sample: due to the requirements, minimum sample sizes of GARCH (1,1) and VaR were both 500 as the size of the data sample.

3. The time period of sample: the release time policy and other related factors; according to the principles above, this study selected a one-year and daily overnight Shanghai Offered interest rate, stock price and stock turnover of BOC in 500 days between September, 2010 and November, 2012.

The data analysis' steps used in this study are the following:

1. Research of NII and operating revenue from BOC’s quarterly, the half year and annual financial reports and then compared the proportions of NII accounting for operating revenue in each quarter from 2007 to 2012 to analyze the importance of NII to BOC profits (Molyneux and

2. Collected each quarterly return on equity (ROE) of BOC in the period of 2007 to 2012 from the BOC quarterly, both the half- a- year and annual financial reports, and then calculated the ROE. Noticed that this research used the NII instead of net income because its purpose was to discuss the relationship between interest rate and profits.

3. Calculated the change rate of ROE in local currency.

4. Collected and calculated the average deposit and loan interest rates and their change rate in each quarter. Discussed how the interest rate might impact net interest income and equity of BOC and the influence on its profitability. And then it also needed to compare the results of BOC to the results of CMBC.

Secondly, by aiming at the ways that interest rate impacted stock price, this research adopted adjusted GARCH (1,1) model to measure interest rate changes affecting the stock price volatility (Hong et al., 2013, Morgan & Smith, 1987). Previous to this, it needed to verify whether the stock price had established any correlation between banks.

Therefore, the specific solution steps of this part were:

1. Used Spearman Correlation to calculate correlation coefficients between each of the two banks as shown in Appendix 1. If the coefficients were large enough, then it continued using GARCH(1,1) in order to resolve the question (Hong et al., 2007).

2. The variables were daily variations of SHIBOR $r_i$ and daily stock returns of BOC $\mu_i$. Moreover, $r_i$ was calculated through the followed formula:

$$ r_i = R_i - R_{i-1} \quad (3.1) $$

where $R_i$ was the $i$th day SHIBOR inter-bank offered overnight rate. $\mu_i$ was shown as:

$$ \mu_i = \ln\left(\frac{S_i}{S_{i-1}}\right) \quad (i = 1, 2, \cdots, n) \quad (3.17) $$

(Hull, 2010)

where $S_i$ was the $i$th day BOC’s closing price in SSE Composite Index.

The specific steps to resolve this question were the following:

1. Introduced interest rate as an exogenous variable into adjusted GARCH(1,1) the formula being 3.11 in order to analyze the effects of interest rates on stock price from the aspect of the rise and fall of the rate. The research for the successful contemplation of the question was achieved by Excel.

2. Compared the results of BOC with two other banks in order to answer the research question, based on the results shown in Appendix 2, 3 and 4.
Thirdly, by using VaR (value at risk) to measure the bank’s risk, the use of several key factors was considered mandatory, such as the market value of the portfolio, holding period, confidence level and annual volatility.

The specific procedures to achieve VaR were the following:

1. Collected daily trading turnover of BOC stock in the sample and calculated the average turnover using arithmetic mean formula:

   \[ \text{Turnover Average} = \frac{\sum \text{Daily trading turnover}}{\text{No. of days}} \]  
   (3.18)

   The turnover average could be thought as an item of market value of portfolio.

2. Calculated the annual volatility \( \sigma_{\text{annual}} \) using historical data and then calculated the daily volatility \( \sigma_{\text{daily}} \) through accomplishing the following process:

   First of all, let the return during the \( i \)th interval \( \mu_i \) be calculated by formula 3.17. (Hull, 2010)

   Then calculated the usual estimate of the standard deviation of the \( \mu_i \) by using the formula:

   \[ s = \sqrt{\frac{1}{n-1} \sum_{i=1}^{n} (\mu_i - \bar{\mu})^2} \]  
   (3.19)

   where \( n + 1 \) was the number of observations, \( S_i \) was the value of variable at the of \( i \)th interval \( (i = 0, 1, \ldots, n) \), \( \bar{\mu} \) was the mean of the \( \mu_i \). The standard deviation \( s \) was regarded as \( \sigma_{\text{annual}} \). (Hull, 2010)

3. Used the GARCH(1,1) model to get the results of BOC annual volatility. Because \( \sigma_1^2 \) did not exist, so it could not ensure \( \sigma_2^2 \). By adopting the Excel tool and using the sample variance of daily stock return \( \mu_i \) (saw the formula 3.16) as \( \sigma_1^2 \) to get out the parameters in turn. Eventually all parameters joined into the GARCH (1,1) formula to calculate other \( \sigma_2^2 \).

4. Figured out the daily volatility \( \sigma_{\text{daily}} \), the size of sample was 500. So set \( \tau = 1/500 \) then the estimate for the daily volatility \( \sigma_{\text{daily}} \) should be (Hull, 2010, 2nd ed):

   \[ \sigma_{\text{daily}} = \sigma_{\text{daily}} / \sqrt{500} \]  
   (3.20)

5. Substituted two different confidence levels into VaR model and discussed. It did not mean that the higher confidence level the better for the banks, the reason being that that profit was directly proportional to the risk- there would not be any profit without business risks. (Hull, 2010, 2nd ed).

   According to the estimated default probabilities as indicated by the rating class table from Christopher James (1996), the coverage level of class A (of these banks) should be 99.89%. Therefore, this paper chose the two confidence coefficients 95% and 99.89% to see the differences in variability of the results, if the case.

6. Calculated the two other banks’ VaR (Jorion, 2001): the private bank CMBC and the nationalized commercial bank CCB, and then compared and discussed them in relation to BOC. This research question was achieved by Excel in Appendix 5.
Although, there is no perfect model used to resolve all the similar problems of GARCH (1,1), this model was used both in researching the relationships between interest rate and stock price, as well as evaluating the risk, repeatedly. The comparison with the results’ analysis of other banks helped provide some comprehensive information on BOC in order to understand its unique characteristics.

**LITERATURE REVIEW AND ANALYSIS OF RESULTS**

As shown in the following Figure 1, ROE fluctuation trends of BOC and CMBC were basically the same, but fluctuation of BOC was obviously stronger and more advanced than CMBC. Besides, they were not linked to fluctuations of interest rates. When interest rates rose, ROE might appear either as an upward or a downward trend (Kaufman, 1980, Chen 2007); even if interest rates did not change, the banks ROE fluctuating would still occur.

Figure 1 Trends of Interest Rates & Their Change Rates and ROEs & Their Change Rates

From the table above, persistence of BOC was very high, at 98.7%, meaning that volatility had a high persistence with an impact on stock price that would be sustained over a long term. One of the reasons
of the weak relation between interest rate and stock price was that China’s interest rate controls limited the interest rate floating (Chen, 2007). Due to the fact that China’s financial reform was still at a preliminary stage, the development of financial market consists of many deficiencies: incomplete market system, lack of market risk-defending and regulatory ability, scarce trading products and tools, etc (Alpera and Anbar, 2011, Feyzioğlu, et al, 2009, Wright and James, 1996). As a result this has driven investors (mainly individual investors) to asset allocations that were converted between money market and capital market with difficulty. Interest rate in terms to the role of cash flow regulation was not obvious and less effects on the stock market volatility.

The second reason was the time-lag and conditionality of stock price to monetary policy, which could reduce the interest rate regulation function greatly, and may even achieved the opposite effect against the monetary policy goal (Mc Kinnon, 1973). The theory effect of interest rate adjustment on the stock market would become clear only through the overall mentality of the market tending to stabilization.

The third reason was the difference of real interest rate and nominal interest rate. Only when the nominal interest rates and real interest rates changed in the opposite direction, real interest rates could really reflect theory effect of impact of interest rate adjustment on the stock market. Nominal interest rates were slashing, due to the fact that the price of commodities fell faster and larger and as a result the real interest rates were likely to remain at high levels.

The fourth reason was the most direct reason affecting stock volatility, which was the relative price of the BOC stock. Early in the development of the stock market, the speculative phenomenon was prevailing and it caused the relative price of the stock of quite a lot of large listed companies to be higher, and of course BOC was one of them as one of the big four banks. Although after several years of adjustment, the situation improved, but the risk was not completely eliminated. The high stock relative prices weakened the cuts effects, which limited the share price’s raise potential when interest rates decreased.

In addition, the excessive speculation and irrational behaviors of the Chinese investors often made stock market volatility deviate from the economic law. It led to the inverse relationship between interest rate and stock price lacking of solid foundation. The stock market could not act as a barometer of monetary policy affecting on the economy, which weakened the effect of monetary policy.

Through the combination of a number of researchers in the theoretical analysis of the stock market in China, it was easy to discover that China’s stock market was still a weak form efficient market which meant that the past historical market information was fully reflected in the current stock price. The market had not any rapid response after the interest rate continued to rise; the investors could also get a certain number of abnormal profits. The interest rate was out of action in short term.

It could be obviously proven that, the daily volatility and yearly volatility of BOC were both less than that of the other two banks. It indicated that once the interest rate was changed, the volatility of BOC stock price and risks of holding share were both smaller than the rest. Although the volatility of CCB was bigger than BOC’s, it was nevertheless more closed to it. CMBC volatility, obviously, was the largest one among the three, direct proportional to the risk of CMBC holdings.

For volatility analysis, risks of investing state-owned commercial banks were generally less than investing in private commercial banks. One of the reasons was that the state-owned banks were more cautious on loans compared to private banks, which generally only lent to large projects fostered by state policies or large state-owned enterprises, thus the risk of bad loans was small; vis-à-vis, private banks lending conditions and audit conditions were looser than state-owned, which led to high profit but once interest rates increased it would increased their bad loans risk. However, it is only in 2014, or more recently, when we noticed that Chinese property companies are buying stakes in banks and raising fears that the country’s already stretched developers are trying to obtain preferential financing from their lenders (Rabinovitch and Noble, 2014).

According to the analysis of the VaR, this model was mainly affected by two aspects: annual volatility and average trading volume. Observing the average trading volume only and compared with the other two, the average volume of BOC was the minimum, even less than half of CMBC. This was likely due to the fact that the profitability of the banks was relatively lower, and a low volatility led to reduced investment profits, thereby the trading volume per day was small. However, combined with annual volatility, the possible maximum loss was also the smallest, even though under every confidence coefficient -interest rate risk, BOC’s was the smallest in the three.

Utilizing Excel Solver to process data under the GARCH(1,1) (Formula 3.8) model and then draw the \(\omega, \alpha, \beta\) and daily volatility \(\sigma_{daily}\),and then use the formula (4.1) to get \(V_L\)

\[
V_L = \frac{\omega}{1 - \alpha - \beta} \tag{4.1}
\]
Then formula 4.2 was used to calculate the volatility $\sigma_{daily}$ of BOC, CMBC and CCB in 500 days.

$$E[\sigma^2_{n+k}] = V_L + (\alpha + \beta)^n(\sigma^2_n - V_L) \quad (4.2)$$

It asserted results from above and calculated these banks' VaR through also utilizing Excel. The confidential level was also selected 95% and 99.89%.

The results above clearly proved the fact that, using the VaR model that was based on the GARCH(1,1) in order to calculate data, could basically reflect the similar characteristics to the former method. It could be said that the use the two methods in calculating the volatility of stock price was in both cases effective. The confidence was higher, the range of probability was greater, and then the probability of the biggest losses that the banks suffered was bigger.

There were great different values of daily volatility between using historical data method and GARCH(1,1). The first reason should be that the calculation principles were discrepant: the former only focused on the daily stock return $\mu_i$ and used standard deviation as the annual volatility; although GARCH(1,1) also used $\mu_i$, it introduced parameters to anticipate the process. Another reason was that they used different formulas to compute the daily volatility: the former only depended on
annual volatility, but the latter not only depended on annual volatility but also depended on the coefficients.

In addition, the influence of interest rate changes on BOC non-performing loans rate was also evident: as interest rates rose, the opportunity cost of loan would be expanded, the difficulty of the enterprise repayment and default risk would increase, thereby causing the ratio of bank bad debts would increase; As interest rates declined, the opportunity cost of lending shrank inevitably thus causing BOC’s bad debts rate to drop down.

But, due to the fact that BOC carried a lot of obligations regarding policy loans and strict systems of examination and approval, it therefore usually only lent the enterprises that the government would pay for, just as any other nationalized commercial bank in China did. These enterprises were large enough, which did not allow them to have measurable sensitivity to interest rates basically. In this case, when interest rates rose, the difficulty of the enterprise repayment became bigger and caused delinquency rates get higher in private banks than BOC. All in all, there was still a weak relationship between interest rate and BOC risk. However this cannot be extended to the other two banks that may encounter due to their risk higher NPL (non performing loans) levels in the near future.

CONCLUSION AND RECOMMENDATIONS

It appears there was not a direct influence of interest rate on BOC profitability because the funding gap and duration gap controlled by managers could change the profitability of bank in general, while the results of the research confirm this also. Due to the fact that the influence of the interest rate on stock price was based on a variety of external factors, there was an ordinary correlation between interest rate and stock price. The volatility and value-at-risk of BOC were both smaller than of the other two banks. It indicated that the investment risk of BOC was lower than others and that BOC looks safer than the other two banks.

How does the Chinese interest rate liberalization impact the development of BOC on its profits?

Interest margin occupies an important position on the main profit of BOC at about 70%, because of the wide interest rate spread (Hong et al., 2013), the low social welfare level of the Chinese population, the segregation of financial business, China’s underdeveloped capital markets and fewer financial instruments.

These factors create high NII proportion of the operating income collectively. Due to the fact that there is not a direct relationship between interest rate and NII and equity and that the two variables can be adjusted by funding gap and duration gap respectively, managers therefore are able to change the character and size of the two gaps either together or respectively in order to fit the change of interest rates so as to influence the ROE used to measure BOC profitability (Gup and Kolari, 2005). Comparing
to CMBC, BOC can adjust the gaps beforehand, the reason may be BOC could get the information in advance as a state-owned bank and it has to adjust early as a large size bank, despite time lags.

**How does the Chinese interest rate liberalization influence the development of BOC on its stock price?**

According to the results of Spearman Correlation (Appendix 1), the coefficients between each of the two banks are about 99%. This means that once a bank stock price is increased, others stock prices will follow. This phenomenon is more obvious between the state-owned banks. The changes in interest rates impacting on BOC stock price volatility indeed exist, but the number is very small. The reason is that there are still other important factors influencing the BOC stock volatility, such as interest rate control, real interest rate, relative price, investor expectation and behaviors, weak market efficient form and time lag effect of monetary policy (Cheng, 2007).

In addition, compared with the private bank CMBC and with the nationalized bank CCB, the volatility of BOC stock price is smaller, which means that the price volatility of the BOC share is more difficult to be influenced by external factors than the other two banks. The GARCH(1,1) results show that the persistence of each bank was about 99%, which illustrates that the volatility of interest rate exists in a long-term impact on the volatility of stock price.

**How to identify and measure the interest rate risks of BOC?**

The results of VaR clearly proved the fact that, by using a VaR model that is based on the historical data and GARCH(1,1) it reflected the similar characteristics, which showed that both methods used to calculate the volatility of stock price are effective. Risks of investing state-owned commercial banks are generally less than that of the investing private commercial banks. The reason is that the state-owned banks are more cautious on loans compared to private banks and only lend to large projects fostered by state policies or large state-owned enterprises, thus the risk of bad loans is small.

Comparing BOC’s VaR with that of the other two banks, the reasons of minimum average volume of BOC include low volatility of stock price and low profitability. Besides, the higher the confidence level the greater the range of probability, and then the higher the probability of larger losses that banks will suffer. In addition, the rise of interest rates also causes the increase of the ratio of bank bad debts. But the bad debts extent of BOC was lower than private banks because it was under control of government.

**Conclusions about the research hypotheses**

There are indeed existing impacts of interest rate on BOC profitability, stock price and stock volatility though indistinctive. The correlations among the banks’ share prices are very strong, but it cannot indicate that it is all about the interest rate. The high persistence of each bank illustrates that, the banks stock price volatility impact on interest rate is long-term and is not changed easily in the short run.
Due to the Chinese complex financial environment, immature investors’ psychology and other multiple important variables acting together, the influence of interest rate is very unidentified and difficult to be measured. Finally, compared with private banks, BOC has a relative low market risk which depends on strictly enforcing the monitoring systems, the latest inside story, and the bank looks to be more cautious on offering loans, as a state-owned bank.

**Recommendations**

The suggestions include two main aspects which include the increase of its earnings and the control and reduction of risks in line with the analyzed elements, as follows:

1. *Increase earnings* may include the increasing of income and the reduction of expenditures. However, both employ different strategies:

   1) **Reduction of the costs and losses from the capital pool**

   BOC uses capital pool to manage all the subsidiary banks capital uniformly in long-term duration. The BOC subsidiary bank must save deposit money from customers into Capital Pool to get capital interest deposit interest (part of subsidiary bank incomes) and take out money from it to provide loans to customers and also they need to pay capital pool loan interest (part of subsidiary bank expenses). The whole process is shown as follow:

   **Figure 2. Operating Process of BOC’s Capital Pool**

   As the diagram indicates, the net interest incomes spreads of subsidiary banks equal to “loan interest - capital pool loan interest - deposit interest + capital pool deposit interest”. This measure might be good for mitigating risks, but it will cause the decrease of the income of subsidiary banks and the increase of operating costs. Therefore, BOC should optimize the capital pool strategy to increase the real net interest income of subsidiary banks.
2) Optimize loan structures
Because the bargaining power of small, medium and micro-sized enterprises are lower than that of large high quality loan customers and therefore the loan interest rates pricing for small, medium and micro-sized enterprises are higher than large high quality loan customers. This is one way to improve the profit of BOC. In order to decrease the influence of interest rate adjustment to the profit as much as possible, BOC should diversify more efforts to developing the intermediate and derivative business rather than interest income related.

3) Other measures
BOC may strengthen pricing management and improve pricing level, not only should further implementation of fine management complete the costs and benefits of accounting, but also it should have risks pricing power based on the credit risk, market risk and operation risk, so as to work out the rate interval you could handle, for the final deposit and loan interest rates pricing to provide technical support to prevent blind competition. BOC should also continue to develop the financial derivatives innovations.

2. Control and reduce the risks refers to three key strategies of BOC:
1) Scattered loan to spread out risk
In the past BOC was only lending loans to large state-owned enterprises which needed a lot of money and whose loan life was very long. Due to current circumstances these enterprises are restructuring a self-sustaining economic model. Thus this situation leads to high risk in terms of the repayment of the debt. BOC should begin to change the customer structure, from large and high bargaining power enterprises transferring to small, medium and micro-sized enterprises.

2) Operational risk management
The bank must continue in promoting the New Basel III Capital Accord operational risk project implementation, complete the bank operational risk management system, optimize the operational risk management information system, promote the integration of group operation risk monitoring platform construction, develop the operational risk management evaluation and capital measurement and improve the meticulous management. (Mihai Yiannaki, 2012).

3) Capital management
BOC needs to accord the medium and long-term capital planning requirements of the group to strengthen internal capital management, optimize the assets structure, in order to make the capital base further compaction. It should also continue to strengthen the capital management, improve the capital budget precision and efficiency, control risk asset scale reasonably, reduce the average weight of risk assets in order to realize the transformation from capital consumption to capital saving and promote the sustainable development of business.
In addition, it should increase the comprehensive benefit evaluation efforts, improve the weight of capital return index in the performance evaluation, guide the branch institutions and business department to develop the comprehensive benefit of higher capital take up less business preferentially, improve capital efficiency, to go “light capital” development way (Rose and Hudgins, 2012).

RESEARCH LIMITATIONS
As an empirical research paper, there must be some limitations that cannot be conquered. First of all, although this research focuses on the interest rate, it ignores the influence of inflation on the interest rate. Real interest rate is the real impact index of financial market behavior and banks profits. Secondly, there is insufficient accuracy in the application of calculation formula and models. ROA, despite its small values should be used to analyze the impact of interest rate on profitability instead of ROE, because ROA could overcome the drawbacks of ROE, although there may be other off balance sheet activities involved in the creation of the NII (Gup and Kolari, 2005, and Crojé and de Beer, 2010). Besides, there are shortcomings in using GARCH and VaR to measure volatility and risk of banks (Sensarma and Jayadev, 2009). Thirdly, because the Back of China has been listed on the Chinese Stock Exchange since 2006, the data used to analyze is so limited that they cannot illustrate the conclusion of the research adequately. In addition, considering the reliability of the lack of data in the sample selection issues makes the peak data bigger and the results are dispersed and not obvious. Fourthly, the data come from secondary research which sometimes cannot express the authenticity and integrality but always tend to the policy of government, which leads to an inaccurate conclusion of the research. In addition, this research ignores the relationships among profits, stock price and risks but analyzes these aspects separately, as per Lobo (2000).

FURTHER RESEARCH
According to the limitations of this research and in order to make it better through further research, it could be indicated that there are three aspects that can be of great assistance: establish the precise models and select the appropriate sample for data analysis, join the two factors inflation rate and real interest rates instead of the nominal interest rate to study the relationships between interest rate liberalization and performance of BOC; pay more attention into analyzing the interrelation and interaction between and among the banks’ profitability, stock issues and risks (Mihai Yiannaki, 2013).

A SUSTAINABLE EUROPEAN MODEL OF LEADERSHIP, INNOVATION AND MANAGEMENT IN THE HEALTH & MEDICAL CARE SECTOR

Mihoreanu, Larisa
The Bucharest University of Economic Studies, Romania

ABSTRACT

The general objective of the large research is to identify and assess the characteristics, limitations and opportunities related to managing legal performing and sustainable businesses in the field of Health & Medical Care sector in order to build a new, innovative model, assuming that policy design is indeed an important new area of design there are implications and opportunities for the design community needs and business models. The specific or task objectives of the research program are the following: • highlight the role of the Health and Medical Care sector in the development of a sustainable growing economy, as mentioned in further more detailed objects and topics; • explore the application of health services management in the world and Europe; • understand the structure of health systems in the context of a multicultural region, in order to see the contributions that they bring to the maintenance and improvement of the population’s health state; • analyse the dynamics between the various components of the health systems in different regions; • understand the concept and dimensions of Health system performance; • explore national, organizational, provider, and patient interventions to improve the performance of health systems; • provide some guidelines to policy makers based on the lessons learned from the outcomes given by the different models and systems analysed within the context they were implemented in.

Keywords: bio leadership, sustainable development, healthcare sector, pharmaceutical industry.

The contemporary social and business environments are characterized by ongoing economic crisis and unsounded structural changes manoeuvred with austerity. Various sectors of activity make laboured effort to cope with internal causes and external forces during a long and difficult process to improve efficiency, competitiveness and profitability. As the entire economy the health sector requires sustainable complex growth in all fields of market and society, depending on macro indicators as they look at the moment. [Nature Reviews, vol. 11. p.3] [NHS Commissioning (2012) Developing the NHS Commissioning Board, p. 1-3]. The main line of reasoning resides in the complex the health care sector should play for all socio-economic, institutional, societal and political fields and operations. A reasonable good health is an indispensable requirement for the human welfare and has to be sustained
by economic and social development in order to be able to sustain the good systems health and support the humankind rights. The Articles 25 of the Universal Declaration of Human Rights states “Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control.”

Despite the fact the European Union Area is positioning in the top regarding the care for health towards its citizens, there are still lots of differences to be amended at regional levels. Also will be important to understand the European health system role and position in attracting new people, creating new value through innovation of new treatments, investing in science and research, develop new therapies with high impact on the population.

Health systems’ performance varies from one country to another, but the discrepancies factors are not known enough. The Governments, the keepers of the health care systems, are more focused on the public care while disregard the private one. The history of health systems is not a longer one, dating from the century 20th but its evolvable rate is much higher. Western Europe used to be at the forefront in founding national health systems to protect its workers [Department of Health https://www.gov.uk/government/organisations/department-of-health]. Such models were progressively externalised to other countries; therefore the present project is an attempt to better understand this transformation and to capture the present state of the art in order to predict the next state that will respond better to the needs of the patients today and tomorrow.

In Europe, Britain was the first in 1948 to set up a National Health Service (NHS) which kept its name until today, just after attempts made by Russia (1917) and New Zeeland (1938) the same year when the Universal Declaration of Human Rights was finalised For that reason the British system will be one of the systems that will be the focus of this project as it set an international example [Chatora R, Tumusiime P Health Sector Reform and District Health Systems, Jan 2004; 13-40].

The UK healthcare system [Department of Health https://www.gov.uk/government/organisations/department-of-health] is in the hands of the British Government for England only, and under the responsibility of Scottish, Welsh and Northern Ireland Executives respectively due to their devolved administration systems, each has their own model of public-private funded healthcare. The general taxation is providing the funds to the UK citizens and offers access to a public healthcare, and for that reason offering also a good system for pooling risks.

At a glance, the Western European countries’ health systems are highly structured, have efficient systems for taxation, strong regulatory framework and sufficient employees in their institutions within a fairly stable political or economical environment. In England, in April 2013 a new health and

Medical care Management necessitates urgent modifications and originative implementations of a matching reform. This will come along with a collateral study of what happens on the Pharmaceutical market, there where the research and development activity remains the wellbeing bases for all nations. Nevertheless, the focus of this project remains the finding of the best answer to the question of what is the best for medical services delivery - through public or private providers and what the appropriate mix of financing mechanisms: government expenditure, out of pocket, or various types of insurance

The pharmaceutical industry is also confronted with challenges such as intellectual property protection, advancing candidate drugs to the next milestones, regulatory compliance. To maintain income despite underperforming research and development (R&D) portfolios, rounds of mergers and acquisitions have occurred such that only 11 of 42 members of PhRMA existing in 1988 now survive [Nature Reviews, vol. 11. p.3]. A first consequence of all this change resides in reordering of the top ten pharmaceutical companies as ranked by market capitalization, although eight of the top ten companies in 2001 were still in the top ten in 2011.

The pharmaceutical industry is currently facing the key challenges of declining R&D productivity, higher barriers to commercial success for innovative drugs and substantial imminent losses of revenue from successful products due to generic competition. Awareness of these challenges has catalysed — and continues to drive — considerable reorganizations in the R&D structures of large pharmaceutical companies.

Among the goals of such reorganizations has been the promotion of the type of entrepreneurial culture and behaviour that is considered to thrive in smaller biotechnology companies [Nature Reviews, Vol. 11, p. 5] in the hope that this will increase R&D productivity. Indeed, industry observers have attributed some of the present crises in the pharmaceutical industry to the discouragement of entrepreneurial behaviour by limitations inherent in the unwieldy bureaucracies that can proliferate in large pharmaceutical companies [Nature Reviews, vol. 11. p. 17-18]. Interestingly, an assessment of the value of small biotechnology companies was driven by the innovation and science in the one or two products moving through their pipelines [Nature Biotechnology Vol. 22, p. 1215 – 1217].

The role of middle managers — defined as those individuals in large pharmaceutical companies who are not at the executive level but who lead large groups or departments and have considerable responsibilities for the successful conduct of projects and programmes — emerged as an important
concern in the productivity of discovery units, even more so than in the case of development. One of the distinguishing characteristics of the biotechnology researchers refers to their closeness to science and their desire to retain the proximity [Nature Biotechnology Vol. 22, p. 1215 – 1217]. However, in other large pharmaceutical companies, excessive concern with milestones often detracts from the ability of research teams to remain close to science [Nature Reviews, vol. 11, p.3]. In the following five years, similar to the recent past, society will face dramatic changes, will witness a big loss in the market capitalization in the pharmaceutical sector because of the fact that the patent protection on today’s blockbuster drugs will disappear and, with that, the big profits for the “Large Pharma” companies [Nature Reviews, Vol. 11, p. 17-18]

Challenges can be found when trying to find treatments for more complex disorders such as cancer, obesity, mental disorders and others such as orphan conditions which are called rare and are mainly unknown for the health care professional and completely lack of treatment. [Nature Reviews, Vol. 11, p. 5] [NHS Commissioning (2012) Clinical Advisory Group for Prescribed Services Final Recommendations, p. 1-227] These conditions, not easy to understand and manage, require more consideration to avoid unimaginable consequences.

Innovation is apparently the key solution but it necessitates a favourable environment that can support the take-off of new ideas and their successful implementation, and will not destabilize or hinder the entrepreneurial energies [Nature Reviews, Vol. 9, p. 683-689]. Nowadays new challenges test the health and medical care sectors pressuring the need to adapt for better serving patient have needs, and diminishing the society costs burden.

Some of these new challenges are coming from the emerging markets with big needs of investment in their Health Care infrastructure. Considering this, the evolution of today society accentuates also the importance of ICT serving the health care but not as an outcome per se, but as a mean in improving the living conditions of society as a hole or for segments of society. The main objective in developing and implementing ICT products is to assure the increase of the quality of life and social development.

Another challenge is represented by the treatment of the specific conditions and the lack of appropriate management and public policies in the field. In the meanwhile we don’t have to neglect that the evolution of nowadays society underlines the importance of information and communication technologies (ITC), not as a result per se, but as means of improvement of the living conditions which depend on both socio-economic aspects and the life style the man adopts. This is the reason why health related quality of life remains an indicator to take into consideration more and more within the set of measures regarding the efficiency in health care.

The nature of the diseases changed towards more complex and new conditions emerged and increased their incidence within a growing global population in such a way that what was rare before,
starts to be recognized more often and needs particular care and new innovative treatments. Present interest in the potential of translational medicine to find ‘the right drug for the right patient’ requires the integration of several activities. These include the search for biomarkers that not only help to select compounds at a preclinical stage, but also help to predict, stratify and monitor the patients and subgroups who will experience the requisite efficacy of the compound and an acceptable level of adverse events. To achieve this, collaboration between research and post marketing surveillance groups is also highly necessary. There is also a high need for a personal touch with the new model of customised medicine even for complex diseases like cancer. Ageing populations represent a new challenge for the society due to the age specific related conditions such as diabetes, hypertension, arthritis, dementia, and various form of cancer.

Establishing and maintaining an entrepreneurial culture during drug development is perhaps easier than during the research stage as the activities associated with this later phase are closer to product realization and clinical application. The inherent sense of urgency associated with the development stage is driven by the competitive environment, in which time to market with a differentiated product is an important determinant of success. Thus, the creation of special product teams for individual efforts and for therapeutic franchises, which are called by development and commercial leaders, is more likely to foster the entrepreneurial behaviours we have identified, such as ownership, outcome focus, passion and conviction, and the ability to recruit the best people. During the research stage, however, entrepreneurial behaviours are often compromised by several characteristics. These include:

- increasing size and complexity of any research groups;
- larger portfolios and a focus on increasing the number of ‘shots on goal’;
- focused middle managers on timelines and portfolios, instead of science, technology and leveraging external knowledge;
- influence on the commercial department (too early in the process);
- the evolving science and technology impact on organizational complexity;
- possibility of alignment between Head of R&D and CE.

As previously said, the aim of this project remains focused on studying the needs, expertise, resources and limitations of the different actors: pharmaceutical industry, hospitals, and patient associations, regulatory bodies in the Health & Medical Care sector, academia, and to offer a sustainable model of innovation, leadership and management that will better answer the needs of today’s patient at the European level [Vasile, A., Mihoreanu, L., Bondrea, A., An Insight into the Rationality of Economic Entities: Emerging from Crises with New Approaches to Social Sciences, 6th EMRBI Conference Estoril, Portugal, 23-24.09.2013][Vicious, T.G., Mihoreanu, L., Groan, L. (2013) Contemporary “Homo Economics”: Defining Wellbeing at the Crossroads of Economic Growth and Business Ethics, The 6th ERMBI Estoril, Portugal, 23-24.09.2013]. The major job is to take out some of the error from the trial-and-error process of drug discovery and management, so that the same level of expertise or resources
that big companies have at their disposal be put at a general disposal onto a large model/portal/platform. The model’s aim will be to bridge the clinical needs to the scientific discoveries from the public domain or industry within a Public – Private partnership [J., Bessant, J. (2011) Managing Innovation: Integrating Technological, Market and Organizational Change (John Wiley & Sons, 4th Edition: London). The evaluation of the social impact of new technological configurations will also be based on a theoretical conceptual framework, gathering the Compendium of Approaches for Impact Assessment of ICT-for-Development Projects (ICT4D) of Heeks, Molla (2009) and Gigler’s studies on evaluation framework based on the capability approach (2004) and on ‘informational capabilities’ (2011) perspectives.

The final research approach will be a multidisciplinary one, at the borderline between different diseases, adequate pharmacology, entrepreneurial methods implemented, managerial theories and practices and ITC methods all having multiple effects on the quality of life. Under such a frame the wealth will not be considered as an issue but the distribution of wealth is! This way, the innovative process will translate through science into new commercial drugs and make recommendations to policy makers focusing on the need to implement a sustainable model which will add value to the society by improving patients’ health and most importantly their quality of life.

ABSTRACT

As the amount of debt has gradually increased, particularly in recent years, Portugal is currently one of the European countries exhibiting one of the highest levels of overall indebtedness, including in both sovereign and private sectors. Indeed, this condition is the outcome of increasing levels of debt assumed not only by the government, but also by companies and families, being the later mostly due to mortgage loans and due charges. This paper focuses on the study of borrowing by Portuguese households. The research has been made in respect to the notion of debt, the consequences of recent developments in debt, among other factors. In order to analyze the factors that are most associated with debt, a study was developed using two multiple regression models, one using a longer time series and another shorter, evaluating the effect of several variables, such as consumption, savings, unemployment, inflation and interest rates, in order to check whether they could be associated with a higher level of debt.

INTRODUCTION

In less than twenty years, Portugal increased from a leverage ratio of just over 18% in 1990 to a rate of 130% of disposable income in 2007 (Frade, 2003). This was one of the highest increases in the rate of indebtedness of the European Union’s countries. Although this data does not serve to indicate the risk of default of families allows, nevertheless, to show how the Portuguese were able to take advantage
during recent decades of favorable conditions associated with the opening of the credit market and the sharp decline in interest rates, the rising real incomes and improvements in the labor market that have led to a significant decline in the unemployment rate.

However, with the recent reversal of the economic cycle, the Portuguese population lives now difficult days and is faced with gloomy news about the state of the Portuguese economy; rising taxes, rising unemployment, cuts in subsidies, reductions in wages among other things, that the Portuguese people have to cope with. This situation is strongly associated with unbridled consumption experienced in recent years, which led to indebtedness of Portuguese Families. For many families the credit is a way to manage a short income budget, resulting in families that give use to credit cards and end up spending more than what they actually earn. It is for this reason that they have been living in standards far beyond their means. These factors have now led many families to renegotiate their loans leading many other to a situation of insolvency.

This status often creates a vicious cycle of debt since, after contracting a loan, families tend to have difficulties in settling this to respond before their financial commitments, so they tend to repeat the process, contracting new loans even leading to situations out of over-indebtedness (outstanding principal and interest value greater disposable income). The rapid accumulation of debt by households also justifies increased monitoring of their ability to repay loans. If the ability to continue to pay the debt on a regular and timely is particularly affected and a significant number of families fail to repay their loans, there may be consequences on financial stability in two main parts. On the one hand, on the financial situation of households own. On the other hand, from the point of view of the parties providing the credits. The current condition of the Portuguese financial sector portrays very well this consequence.

This study aims to determine the determinants and effects of borrowing by Portuguese Families. For such, several topics are researched, such as the concept of debt, debt indicators in Portugal, explanatory theories of debt, the factors influencing the debt will be studied; the effects of debt/debt in the economy, and finally analyzing whether the factors influencing the debt are negatively or positively associated. Household debt results from imbalances between receipts and expenditures of households, ie the result of mismanagement families with what you earn and what you can spend. However, debt is also related to loans that are granted to households, since we live in an era in which credits are made immense, often credits in order to pay other claims are also made. Thus, the problem of indebtedness arises when families can not meet their obligations.
DEBT FRAMEWORK

According to OCR Macro (2001), it is argued that although there is no common European definition of indebtedness, this can be defined as the result of an imbalance between spending and consumer income, thus leading to a failure to make payment under a or more debts, ie when the level of debt is unsustainable. The debt has been the subject of several studies in recent decades. This has been understood as a multifaceted behavior, since it had the contribution of various disciplines such as psychology, economics, sociology and political science. Indeed, according to Lea, Webley and Levine (1993), contract or having debts is not only related to economic variables, since these authors were studied by social and psychological variables to justify the debt, such as social support debt, styles financial management, consumer behavior, among other variables.

For Friedman (1957), one of the bases of the indebtedness theories is the theory of permanent income. This theory explains consumer behavior in relation to consumption and the formation of expectations. This considers the permanent income as a proportion of income that people consider in the future and maintain transitional income as the deviation of current income relative to permanent. According to this author the permanent consumption is defined by consumption that is planned by individuals, the transitional consumption results of specific factors in life such as job loss. This theory argues that the consumption plan of individuals depends on their expectations regarding permanent income, having a key role in making financial decisions.

Authors such as Modigliani and Brumberg (1954) and Wärneryd (1989), argue that the theory of life cycle is another perspective to explain consumer behavior. This theory is based on two assumptions which are: “individual behavior is oriented to the future”; and individuals optimize their resources throughout life; when you are optimizing their resources lifelong, individuals are sensitive to changes in interest rates; this income is an indicator of what the future will yield. Thus, individuals are rational economic actors, ie individuals who trace their financial behavior for the future in order to maintain a pattern of stable life. Young individuals tend to borrow at midlife settle debts incurred in the initial phase of your life and start worrying about the savings, so use them in retirement to maintain a stable standard of living (Modigliani and Brumberg 1954).

There are several factors that, according to several authors, influence the debt (eg Raaij and Gianotten, 1990). According to Raaij and Gianotten (1990), the people with higher income spend and contract more loans and show a greater propensity to use credit cards. In the study by Boddington and Kemp (1999), they found that the sex of the individuals also influences the debt. These authors found that men have higher amounts of debt to women. To Godwin (1998), the household size is another factor that is related to the increase in debt. The marital status of individuals, according to Kinsey (1981), is also related to the debt, because the study was carried out by these authors concluded that when one
is married, spending on credit cards are higher. According Lea et al. (1995) when a household is composed of a greater number of children of this household debt is higher, thus the number of children is another factor influencing the debt.

The educational level is indicated as another factor, as referred by Canner and Luckett (1991), and Lea et al. (1993), that influences the debt. These authors argue that households with less schooling and households with a higher level of education tend to have more debt relative to income. Cameron and Golby (1990) argue that age is negatively correlated with the amount of debt held by households. The debt is related to the life cycle in which it is the aggregate, since the financial commitments usually increases with age, and older individuals are more likely to have higher than younger individuals debts. Another factor that is related to debt are the attitudes to credit cards, since individuals who have a favorable attitude to credit cards have a higher likelihood of having multiple cards, have a higher level of indebtedness and are more subject advertising (Chien and Devaney 2001; Davies and Lea 1995). Social class, according to Solomon, Bamossy and Askegaard (2002) influences the debt, because when the individual belongs to a higher social stratum, believes that it is more advantageous to use credit to purchase luxury goods than those who belong to middle class or casualties. Bird, Hagstrom, and Wild (1997), argue that the employment situation is also strongly linked to debt, since the employed people tend to have a greater number of debts of the unemployed.

Factors influencing on debt

Braucher (2006), argues that excessive debt can be understood through two factors, cultural factors and structural, as can be seen in the following table.

Table 1 - Structural and Cultural Factors Influencing Over-indebtedness
The large increase in debt by households, according to Worthington (2006), constitutes a threat to the welfare of this, which leads to a successive increase of the debt in default and many orders of insolvency or over-indebtedness, this has been more sense in Western societies. This is a situation that entails a greater number of consequences for the individual and undermines your budget or your household balance, which leads to strong implications for social and psychological level these individuals, leading to an increased level of financial stress Worthington (2006). Once the economic and social consequences of over-indebtedness are important is essential to analyze the trend of debt and proceed to study the nature and extent of over-indebtedness. In addition to the implications for society, one can not forget the problems that over-indebtedness leads to the real sector of the economy, because the increase in cases of families unable to meet their financial commitments affect levels of trust necessary for the normal functioning of credit market.

The study of over-indebtedness of households, can be done from two perspectives, namely the microeconomic and macroeconomic perspective (OEC 2002). Studies of microeconomic origin, household indebtedness, are very important at the present time, due to the high level share of this sector and the increase of the breaches. This work studies the individual data of concrete, broken households by socio-economic characteristics, with the aim of assessing the extent and nature of the cases. The use of macroeconomic aggregates using data to establish through empirical models, the relationship between the number of cases of over-indebtedness and the evolution of certain socio-economic variables may be regarded as a solid approach according to existing literature.

The portuguese Debt case

Over recent year, according to Faria and Noorali (2004), the indebtedness of Portuguese Families increased a dramatic pace. A value of about 20% of disposable income in 1990 to 40% in 1995, arriving in 2004 to reach a value of 118%. For Flour (2007), this large increase was predictable and can be understood as part of the catching-up process. During this period the sharp decline in the rates of nominal and real interest, the abolition of some legal barriers as well as the climate of increased competition between banks, provided access to credit to a broader set of households compared to the previous decade.
The large growth of household indebtedness, according to the Centre on Consumer Debt, CSG (2002), reflected the rational adjustment of families and alterations to credit institutions, both supply-side and demand-side credit. On the supply side, the liberalization and deregulation of the Portuguese financial system and the consequent increased competition in the credit market have led institutions to invest in the segment of loans to individuals with low levels of debt. On the demand side, changing cultural patterns, the decline in interest rates, the increase in disposable income and the containment of unemployment have also promoted the growing indebtedness of Portuguese Families.

Over the years the public debt of countries has increased in most advanced economies and this trend was accompanied by a dynamic GDP growth. In many countries, including Portugal, public debt increased, on average about 30% of GDP in the sixties to just over 60% of GDP in the last decade (Rother and Westphal, 2012). As the debt increases is important to analyze the economic impact as well as the strategy to exit the crisis. For Reinhart and Rogoff (2010) the debt in peacetime can be considered more problematic for the future growth of an economy, since the debt tends to be persistent for long periods of time compared to the explosions of debt in times of war. These authors argue that the economic and financial crises are conducive to contribute to the accumulation of public debt. The financial and economic crisis that has come to feel since 2008 has placed considerable strains on the debt and in general on the public finances of the euro area countries. The ratio of the budget deficit in the euro area increased rapidly from 0.7% of GDP in 2007 to 6% of GDP in 2010, while the gross government debt rose from 66% to 85% of GDP in the same period.

According Rother and Westphal 2012, the literature on the relationship between public debt and economic growth is scarce, but has gained great importance. However, the existing literature points to a negative link between the ratio of government debt to GDP and the growth rate of steady state GDP per capita. However, some endogenous growth models show that it may be possible there is a positive impact on the transition to the steady state, depending on the type of public goods financed with debt.
In the study by Reinhart and Rogoff (2010), where we analyzed the evolution of public debt and the rate of GDP growth over more than two centuries, they concluded that there is a long period for a weak relationship between public debt and growth debt/GDP below a threshold of 90% of GDP and above this threshold, the ratios average growth rate falls by one percentage point.

**VARIABLES THAT INFLUENCE THE INDEBTEDNESS**

The indebtedness of Portuguese Families can be influenced by several factors, as previously mentioned. However at this point the variables (or factors) that will be used in the case study, what more can influence household debt, and the following are presented: Income of Families Portuguese; Savings of Portuguese Families; household consumption; the unemployment rate; the inflation rate; the interest rate; GDP.

**ANALYSIS MODELS DEBT**

Methodology

Household debt has been a major obstacle in resolving the deep economic and social crisis that Portugal is going through. Given this situation it is intended, at this point, make a study on the indebtedness of Portuguese Families, ie analyze which determinants and effects of borrowing by Portuguese Families. For this one goes to use two statistical estimation models.

Samples and Models

For this study will resort to an econometric model that has as dependent variable the "Indebtedness of Portuguese Families", a separate component, called the constant (β0) is not influenced by the different explanatory variables. This study consists of two models, the first model where observations total 33, while the second model consists of 10 observations. Statistical data are presented as a time series. The Model 1 consist of six independent variables as the disposable income, savings accounts, the private consumption the unemployment rate, the inflation rate and the interest rate. The Model 2 consists of four explanatory variables being the disposable income, the rate unemployment, the interest rate housing loans to GDP. In order to study, interpret and analyze the data contained in gretl software, a statistical model, the OLS model will be used. The main problem consists in estimating the model that is best suited to the characteristics of the subject in question, ie the "Indebtedness of Portuguese Families".

Hypotheses to be tested

At this point we want to identify those factors that may influence the indebtedness of Portuguese Families, using the development of hypotheses. Thus, one can formulate the following research
hypotheses, for Model 1:

H1: The disposable income of individuals is positively associated with household debt.
H2: The savings is negatively associated with household debt.
H3: Private household consumption is positively associated with household debt.
H4: The unemployment rate is negatively associated with household debt.
H5: The inflation rate is positively associated with household debt.
H6: The interest rate is negatively associated with household debt.

Regarding Model 2, we intend to test the following hypotheses:

H1: The disposable income of individuals is positively associated with the indebtedness of Families.
H2: Interest rate housing loans is negatively associated with the indebtedness of Families.
H3: Unemployment rate is positively associated with the indebtedness of Families.
H4: The GDP is positively associated with the indebtedness of Families.

Analysis and discussion of results

Univariate analysis

Over the years the indebtedness of Portuguese Families, measured in this study through borrowings by them, has been increasing steadily and quite sharply since 1980. But it was from the year 1992 we noticed the most increase in debt. Regarding household consumption, this has also increased over the years he has had a more significant increase from the year 1989 with the value 28.3046 billion euros, though there was a decrease in the last two years under review. However, variables such as savings, the unemployment rate and inflation rate fluctuations have had quite a few over the years under study, and saving a larger peak in 2012 with € 14,452,500,000, the inflation rate in 1984 with 28.38% and the unemployment rate also in 2012 with 16.80% (as can be seen in the following table). Regarding the performance of individuals, these have gradually increased during most of the years under study, with a decrease in recent years.

| Descriptive Statistics, using the observations 1980 - 2012 |
|-------------------------|------------------|------------------|------------------|
|                         | Average          | Minimum          | Maximum          | Standard Deviation |
| End_                    | 51626.3          | 26849.0          | 729,000          | 141210.0           |
| Rend__Disp_             | 46428.0          | 45368.4          | 4399.33          | 86694.4            |
| Poupp                   | 7736.34          | 8305.30          | 1230.40          | 14452.5            |
| cons                    | 60768.6          | 60819.8          | 3145.21          | 114957             |
| Tx_des                  | 0.072047         | 0.0669218        | 0.0401534        | 0.168058           |
| Tx_inf                  | 0.0814515        | 0.0422000        | -0.00830000      | 0.283800           |
| Tx_juro                 | 0.0919697        | 0.0700000        | 0.000000         | 0.250000           |

Table 2 - Descriptive statistics
Bivariate analysis

By analyzing the correlation matrix it follows that the dependent variable is more correlated with saving, consumption and the interest rate, ie the increase of these variables is involved with the study variable. However, it also appears that the use is related to the interest rate and the rate of inflation and the inflation rate is related to the interest rate.

Table 3 - Correlation matrix

Multiple regression analysis

Given the variable under study, the indebtedness of Portuguese Families of two multivariate analysis models were constructed to sustain the developed theoretical concepts and hypotheses as defined.

Analysis of the estimated model (model 1)

The estimation model that is presented below was estimated by the method of least squares (OLS).

Thus, the following model was obtained:

\[
\text{End}_i = -34230,8 + 0,193254 \times \text{Rend\_Disp}_i - 3,52141 \times \text{Poup} + 1,29804 \times \text{Cons} + 349975 \times \text{Tx\_des} + 236641 \times \text{Tx\_inf} - 212104 \times \text{Tx\_juro}
\]

In the model obtained previously had a R-Squared (R2) of 0.974941, which means that the estimated model is satisfactory. As for the adjusted coefficient of determination, is a coefficient which discounts the effect of a large number of explanatory variables. Thus it can be seen that the model formulated is 0.969158. The formulated model can check the level of significance of each variable and its probative value. Thus, it appears that the significance level of 5% the income variables available and interest rate and constant are statistically significant and savings, consumption, unemployment rate and inflation rate variables are statistically significant and a significance level of 1%. Finally, o modelo respeita as hipóteses clássicas do modelo de regressão múltipla, nomeadamente homocedasticidade, ausência de autocorrelação dos erros e distribuição normal dos resíduos.
Analysis of the estimated model (model 2)

As previously stated this model was constructed over a shorter range (10 observations). Thus we obtained the following format:

\[
End\_ = -182581 + 0.365418 \text{ Rend}\_ - 190487 \text{ Tx-Juro\_habi} + 136961 \text{ Tx\_des} + 1.63188 \text{ PIB}
\]

In the model obtained previously made an R2 of 0.990384, which means that the estimated model is satisfactory, it is 0.982691 also high. In the model formulated it turns out that the significance level of 1% is it constant and a significance level of 10% the variables unemployment rate and GDP. What demonstrates that these variables may not be sufficient to explain the dependent variable.

Finally, the model satisfies the classical assumptions of multiple regression including homoscedasticity, no autocorrelation of errors and a normal distribution of residuals model.

Discussion of results

At this point of the thesis are made comparisons between the results obtained and the expected results. In Table 4 it can be seen that the results obtained for each of the study variables and the expected results for Model 1.

Table 4 - Comparison of results (Model 1)

It also appears that the variables household savings and unemployment have not had the results the same as expected. Regarding savings, theories pointed to a positive association with the debt, but this has not turned out so the savings are negatively associated with debt, ie the more the savings increase more debt decreases. Regarding the unemployment rate, this was also not the result we expected, since the theories suggested a negative association towards the debt and turned out to be a positive association, ie the higher the unemployment rate, indebtedness. For the remaining variables (income, consumption, inflation rate and interest rate), it was found that the result was equal to the expected outcome variable interest rate is negatively associated to debt, so its increase results in a decreased in debt. Variable yield, consumption and inflation are positively associated, since the increase these variables leads to an increase of the variable debt households.

The following table (Table 5) relating to Model 2, it can be seen that only the variable rate of unemployment had a result different from the result expected. The income variable interest rate
housing loans to GDP submitted a result equal to the expected result.

*Table 5 - Comparison of Results (Model 2)*

It was also found that the variables income and GDP are associated with the indebtedness of families in a positive way, so that the increase of these variables leads to an increase in household debt dependent variable. Only the variable interest rate housing loans had a negative towards the debt variable, so the increase in this variable leads to a decrease in debt variable association. When making a comparison between the two models (model 1 and modelo2), one can conclude that the variables that both models had in common even reached the results, we conclude also that both variables were not meeting with expected, but the results are better specified variables in Model 1 since they have greater statistical significance. Thus, it appears that to study the indebtedness of Portuguese Families, in this particular case is better than model 1 model 2 because model 1 is best explained and model 2 is not sufficient to analyze a fact so important to worldwide.

CONCLUSIONS

This study's main objective was to determine what the determinants and effects of borrowing by Portuguese Families, since this topic is fairly current and only now has given a greater importance by modern literature on debt. To enable it to meet this objective, we carried out a research study, using firstly existing literature on the debt. Portugal has a large debt level, which was progressing very rapidly over the years, so its rate evolved much since the 90s to the present day, which meant that the risk of debt also increased sharply.

The debt can be defined as a result of an imbalance between spending and income of the consumer, in this particular case of Portuguese Families is also associated with loan commitments, most commonly mortgage and consumer debt, being mortgage loans the main source of debt. This can have a negative effect on the economy, since the increase in debt may cause a long term decrease in the growth rate of a country's economy, as families are indebted and do not have as much capacity to consume, having to pay debt interests and fees, which may result the country economy to fall into recession.

There are several factors that can lead to debt. In the examination made in this paper, referring to model 1 these factors include disposable income, savings, consumption, unemployment rate, inflation rate and interest rate. As for Model 2, the variables examined were disposable income, the interest rate of loans to housing, unemployment and GDP. While making this study it was concluded that all variables used could bring significance to the model, i.e., they are all important when studying the debt
because they gave predictive explanation power to the model. Regarding Model 2 only two variables, the unemployment rate and GDP, have some significance to the model, but it is not enough to demonstrate that the chosen variables in Model 2 are satisfactory when analyzing household debt. After obtaining the results of the regression model one can conclude that there was an association between the independent variables and the dependent variables. We also found that most of the results were against the expected results, namely the variables income, consumption, unemployment, inflation and interest rate. As in the model with 2 variables yield, interest rate housing loans to GDP. Thus it is concluded that the study variables in Model 1 are determinants of debt, which was not observed in model 2, and that the income variables available, private consumption, unemployment and inflation are positively associated with debt that is, an increase these variables results in an increase in the debt variable. As the savings and interest rate variables are negatively associated to debt, so when there is an increase in these variables the debt decreases. It can also be noted that for the purpose of this paper, ie to analyze the determinants and effects of household debt in Portugal, the model 1 is the most powerful, since the variables associated with the model have more statistical significance, being therefore concluded that that this model was better specified. When comparing the results obtained with the expected results, it can be concluded that four of the variables were against the expected result, as the variable interest rate presented a negative association with respect to debt and equities, while consumption and inflation exhibit a positive association with respect to the indebtedness of Portuguese Families. The other variables, such as the savings and unemployment, had also a model result opposite to the expected result. It is important to note that increasing debt is a hot topic, this is due to the phase of crisis that Portugal, and other developed economies, are going through, so it continues to be important to develop studies on it such as to research other possible effects on the economy caused by indebtedness by other than households, such as by corporations, and the financial sector.

LAST MARKETING COMMUNICATION CHALLENGES IN LUXURY BRAND MARKETS: A COMPARATIVE ANALYSIS

Mosca, Fabrizio; Casalegno, Cecilia; Feffin, Alessandro
Department of Management, University of Turin, Italy

ABSTRACT
Marketing communication strategies, together with instruments and actors involved in their planning process, need to confront themselves on the one hand with the evolution of technology and the other with the transformation of consumer behavior.
This research project assumes that companies should change their strategic action, if they want to communicate with their changing target. What happens in luxury mature markets? The intent is to empirically examine how luxury companies communication strategies evolve towards a stronger relationship with the audience. This involves a continuous interaction and sharing of content and values in terms of enhancement (luxury brands value enhancement through exclusive content, so as to enhance the consumer experience), expression (strategic action for a more effective communication, in order to reach considered markets goals) and empathy (ability to establish a relationship with the customer can be more intimate).
Eventually, it is stressed that, in the present context, the players who have the most authority and esteem are the ones that have a higher number of impressions on social networks and a higher frequency of video views and shares content online.

Keywords: Integrated marketing communication, user generated content (UGC), luxury goods, mature markets, social networks, reputation, innovation, consumer behaviour, brand experience, engagement.

INTRODUCTION
Media continuous evolution has led to the consequent approach between business and target audience even in those markets where, traditionally, the business-consumer has always been top-down (Schultz, DE, 1992). In which way the technological progress is lived and declined in communication from luxury companies in mature markets?
Given that consumption is essentially a communication system that is expressed through a multitude of languages, the greater the stratification of a society, the more languages will be spoken and will be much more complex to analyse consumption dynamics. This is especially true for luxury goods (Chevalier, Mazzalovo, 2012), in a context where the use of communication is experiencing a transition
from “linear to multi device” (Mattiacci, 2012). The “future” of the luxury communication will be the result of a number of macro trends, some of which are already on the market, able of influencing the system of consumption both in general and in the specific context of the high quality products markets. In addition, if it is true that the traditional marketing mix variables are declined in a particular way within the luxury markets, it is necessary to wonder what is appropriate to share and communicate with the target audience manifesting a growing interaction propensity.

The main aim of the present research has some starting point. First of all, worldwide firms, nowadays, look ahead to the integrated communication tools as the most strategic way to improve their assets and business, especially over discontinuities (Casalegno et al., 2012). Secondly, managers have to consider that building a strong brand communication structure could be valid for all the stakeholders as extended audience (Kliatchko, 2008), since communication is not a two-way factor (Grunig, 2001) anymore. The present research has therefore a threefold goal: it wants to investigate how luxury brand communication has been evolved in the latest years, it focus the attention on the analysis of social and viral marketing new trends, it suggests a new application model in order to better manage new communication tools available in this multidirectional communication era, considering that the integration among various communication tools is nowadays the condition through which a firm can protect the core of its intangible competitive advantage.

THE CHANGE OF LUXURY GOODS COMMUNICATION AS STRATEGIC LEVER FOR A WIDER AWARENESS.

While the power of mass media is undergoing a decline, due above all to generation Y media attitudes, there is a growing interest in new media generated by the consumers themselves, or the so-called user-generated content (UGC): blogging, podcasting, online video (eg : Youtube, Vimeo), social networking (Facebook, Twitter, Pinteresst, Google plus). Internet is getting the real "backbone of the media system" (CENSIS, 2012). The trend sees all organizations dealing with the programming of a communication plan that integrates all the tools with which they intend to interface with their stakeholders (Schultz, Tannenbaum, Lauterborn, 1993; Romano, 1988; Krugman et al., 1994; Collesei, 2002; Duncan, Mulhern, 2004; Aiello, Donvito, 2005; Collesei, Ravà, 2008; Belch, Belch, 1998, 2009). Companies don’t just have to be present on the web through “websites showcases,” but also they need to become the real protagonists in the process of information and experience creation and exchange, providing to users and brand followers dedicated spaces, content and additional services. The concept of integrated marketing communication - strictly related to the integrated firm communication (Romoli Venturi, Casalegno, De Palma, 2014) - becomes inseparable from the one concerning common values sharing with stakeholders: people talk about social values of corporate social responsibility, which assumes an
attitude of protection of the environment (geographical, economic and social) on which the organization (firm, when for profit) intends to develop its strategic action. Porter and Kramer refer to the concept of social innovation (2011): they see in the sharing of values between the business community and the organization main key to competitive advantage. The above macro trends are to consider in addition to already well-established factors, such as: the ‘90s West economic development, which led to a consolidation of high value product markets, traditionally recession proof; the opportunities arising from the internationalization and expansion which gave way to luxury brands to approach with success new markets; the emergence of the internet and social web related phenomena. In this context, consumers in mature markets have been characterized by a series of changes that led to contradictions and paradoxes. It is thus possible to consider three macro trends that will contribute to a substantial change in consumption related to competitive environments considered (Corbellini, Saviolo, 2007). The first is the search of experience and personal gratification. The decade in which we live (2010-2020) is characterized by the centrality of the experience (Mosca, Casalegno, Feffin, 2013). The focus is no longer on “what”, but on “how” people buy things. Therefore, Kotler (2006, 2009) third “P” - distribution - is becoming increasingly important in major luxury markets strategies and the point of sale becomes the final touch point in the integrated communication process. Here the consumer can impart, through tangible and intangible elements, the image of the brand itself (Mosca, 2011). The second is the technology pervasiveness. Nowadays, it is evident the overwhelming role technology has had on the purchase and use of goods scenario. In fact, thanks to advances in innovation, final consumers have changed their behaviour and role in the purchase, from passive to active users, expressing the desire to produce content and participate to products and services development of what they are "invited" to consume (Mosca, Casalegno, Feffin, 2013). The information technology increasing development (Rifkin, 2000) and the continuous compression of products life cycle reinforce new consumption mechanisms will be focused not in the possession of the product, but in wealth and consumption experiences sharing. Eventually, the third is named iper-mediation (Corbellini, Saviolo, 2007). The social stratification, in fact, has always been the basis of the luxury and fashion goods consumption in a ostentatious logic, this logic has always been related to show the others. To these motivation, that could be defined “historical”, in recent years it is to add others consider luxury consumptions to satisfy personal needs, well defined as “self realization” needs (Mosca, 2011). The contemporary presence of these two different consumption logics have taken to the birth of some bubbles demand (Brondoni, 2007), they are paradoxes, new buying behaviours. In recent years researchers and managers can find that various consumption forms are living together: from the more traditional buying behaviours (well described in the Conspicuous Consumptions Veblen Model), to the birth of the connaisseurs, ecc (Corbellini, Saviolo, 2007). This is due to the on-going changes related to
purchasing schemes used by a customer defined (Okonkwo, 2010) as smart, well informed, always looking for brand new experiences and relationships. He/she is powerful, influential, individualistic, but at the same time he/she looks for constant connections with the community.

THE LOC MODEL: A NEW SUGGESTION FOR A BETTER LUXURY COMMUNICATION.

In a new scenario where web experience is based on the exchange, sharing and collaboration, the luxury consumers are certainly not been immune to this revolution (Atwal, Alisair, 2009). In fact, especially in this particular competitive environment, consumers are looking for a deep and intimate relationship with brands (already suggested time ago by Roberts, 2005) that emphasize the recognition, respect, dialogue and collaboration with their customers. On the other hand, customers tend to reject those brands that do not recognize them the involvement and attention they require. In this scenario dominated by a stronger relationship between people and technology, communication and web, the luxury goods marketing requires new communication model based on 7E (4E +3E): Experience, Exclusivity, Engagement and Emotion (already perceptible in Okonkuo articles, for example), in addition to other 3E risen from the opportunities that the web, and in particular the social web, have brought in communication: Expression, Enhancement and Empathy (Mosca, Casalegno, Feffin, 2013).

Experience. During the recession and post-recession, unlike other markets, the traditional consumer of luxury does not have significantly limited their consumption. While the luxury market and the spending on luxury goods has grown, on the other side luxury consumers have become more selective, informed and a little bit cynical. Today, the purchase decisions of luxury consumers revolves around the question: "Is it worth it?". In this scenario, the luxury companies had to provide a unique and compelling/engaging experience (Okonkuo, 2005). Some authors have observed how the next decade will be characterized by the centrality of the experience. An example of this trend is offered by the luxury maison Burberry in the opening of his flagship store in London on September 14, 2012 in the heart of London. The flagship store, thanks to technology developed by the brand, is designed in order to increase customer’s engagement (and purchases) through in-store digital and tactile experience that shows the historical and artistic heritage of the brand. It was developed as the physical expression of Burberry.com, in fact rooms in the flagship store follow the sections of the website available online, diving costumers in a digital and physical combined experience. In conclusion, the strategy put in place by Burberry not only allows costumer to increase the perceived value of the brand improving their shopping experience, but allows to increase the permanence, in terms of the time spent in the store, creating desire to return and repeat the experience.
Exclusivity. In marketing exclusivity is considered as arising from the second P of marketing mix: the price. The exclusivity, however, has always been the cornerstone of luxury’s strategies and no appearance has never been more intensely protected. Is widely believed that the use of the digital marketing’s levers in luxury strategies could “put in jeopardy the exclusivity of the brand,” but, on the contrary, they offer a real opportunity and an elegant way to control and develop such exclusivity increasing at the same time the visibility of the brands. As a result, the players of the luxury market have created exclusive platforms for consumers, as for instance the community. This expedient has been used, for example, by Burberry for its Art of Trench. Each maison, in fact, has a special icon which distinguishes one from another. For Burberry this icon is trench coat. For his symbol garment, it has been created a real fashion social network that collects shots of characters, famous and not, who wear the icon of the company.

Engagement. Engagement in the luxury goods is granted and often evoked by one thing: the story. Any video, online experience or a simple post on Facebook, which is equipped with an engaging content, constitutes a story that arouses emotions and involves the viewer in an unique experience. Today, in the luxury markets, convince the consumer to buy is not sufficient. Convince them, however, to participate at an exclusive trip with and within the brand is the key to success and that is what stories make. Tiffany, for example, reported a significant increase in sales, after that the public and the press greeted with enthusiasm the microsite developed by the brand: What Makes Love True and mobile application Engagement Ring Finder; the two elements of digital marketing that conveyed the powerful and engaging history of the brand Tiffany in achieving the true love. Tiffany has decided not to focus only on selling products, but on an entire way of life.

Emotion. The combination of the three variables previously described, give life to the fourth element of the luxury marketing: emotion. Without the proper application of this key variable, the success of luxury brands is not sustainable in the long run. The reason is simple. The luxury firms have to do with a consumer that can buy almost anything he/she wants. In this context, the physical product acquires secondary importance in favor of what luxury consumers are really looking for: a more personal experience or an engaging story that will inspire in them a particular emotion.

Enhancement: enrichment of the content of luxury through exclusive content, that could be shared, in order to increase the consumer experience.

Expression: internet gives the chance to manage the communication time and spaces. This has given way to a communication that is more charming, elegant and dream-like, able to reach a specific target market which until now was not possible with the only above the line media.

Empathy: new UCG media are able to give to luxury firms personal information about customers and allowing companies to establish a more intimate relationship with the customer, that is in line with the
inversion of the traditional scheme communication that has influenced the current scenario in almost all markets.

The LOC model has been tested previously (Mosca, Casalegno Feffin, 2013) on a sample of about 600 people, for most part of generation Y and all within what are called mature markets. In this present study, the objective will be to test, in particular, the last model 3E that refer to more interaction with the target audience.

WEB 2.0 STRATEGIES IN LUXURY MARKETS: A COMPARATIVE ANALYSIS.

In order to better define development trends in luxury markets communication strategy, the case analysis methods have been considered to underline, when possible, different and similar firms’ media attitudes. The analysis has been based on ways through which global luxury goods firms integrate their communication tools each other, by focusing the attention on web and social strategies. To do that, the comparative analysis of thirty international cases – chosen to represent in an equal way different luxury brands markets - allows to estimate not just the on line presence, but even the contents different players post in order to share with the online audience. The surveys of the major social platforms (Facebook, Twitter, LinkedIn, YouTube) have been carried out at two different times. A first survey was carried out on a daily basis from April 14th 2013 to May 14th 2013, while a second survey was carried out after 10 months (March 14th, 2014). Were examined just such periods of time as it does not fluctuate - media and sales volumes – due to seasonal origin (eg: Christmas, Valentine’s Day, Easter). The intent was to understand how the luxury markets players are approaching their use of social media tools in the field of wide consume and, more importantly, what kind of reaction from the audience these media strategies generate.

RESULTS ANALYSIS AND FINDINGS

The analysis allowed estimating the “web activity” of the thirty firms operating in the luxury markets, not only in quantity (number of like, followers and share), but also in terms of quality on the basis of the content published on line by the same businesses.

The interpenetration of the two surveys also allows to study the evolution underway in the new media, as far as the luxury sector as a whole, and to propose a hypothesis for management to optimize communication online.

</table>
Table 1 shows that over the years luxury firms have gradually developed a direct presence in the online media landscape, following the path already traced by the most advanced companies in the consumer products. Most companies have a Facebook page and is present through its own channel on YouTube. Concerning online contents and the typology of what posted by luxury firms, the daily report (April 2013-May 2013) has shown what follows in figure 1 and in figure 2.

Figure 1. The luxury firms online contents (daily monitoring 14th of April 2013- 14th of May 2013, considering the major social networks).

![Figure 1](image1.png)

Figure 2 – Online contents purpose (daily monitoring 14th of April 2013- 14th of May 2013, considering the major social networks).

![Figure 2](image2.png)
Figure 3 shows the awareness linked to new online media in terms of likes / shares and followers. This first analysis of social media use doesn’t consider the use of LinkedIn due to its scares use by luxury firms; it is to underline this democratic social media use. Figure 4 also highlights (taking into account the top 10 companies analysed in terms of online visibility) as the firms use the YouTube channel to manage their communication. Such use of the web, in fact, allows companies to disseminate films that have a duration that gives the chance to build the idea of “dream” and the dreamlike landscape typical of the communication of the luxury brand. The data relating to other social media are to be considered: comparing the number of brands like Chanel with the one related to one of the most famous brand in the consumer market, such as Benetton, it turns out that that the number of like and share the first is twice that of the second. The above is as relevant as ever, taking into account the shortest time from brands like Chanel have developed their own online presence.

Figure 3. The UCG success in luxury markets”. (Monitoring of May 2013, compared with March 2014).

Figure 4. The top 10 luxury firms in terms of visibility” (Monitoring of May 2013, compared with March 2014).

Considering the different increases of visibility, the research has focused the attention on the possible correlation between the Facebook likes and Twitter followers, the one concerning Facebook likes and
LinkedIn followers, the one concerning YouTube official channel visualisations and Facebook likes and the one concerning the increase of Twitter followers and YouTube visualisations. The used formula has been the Pearson-Bravals correlation index:

\[
C(x, y) = \frac{\left(\bar{x} \bar{y}\right) - \bar{x}\bar{y}}{\sqrt{\left(\bar{x} - \bar{x}\right)^2 \left(\bar{y} - \bar{y}\right)^2}} + 1
\]

In which: \(C(x,y)\) is the correlation to test; \(x\) is the augment of Twitter, LinkedIn and YouTube followers/visualizations; \(y\) is how much can augment the number of Facebook likes. Despite is not possible to say that the used sample can be statistically relevant - because of the scarce number of analysed players - the results can be interesting for an early stage research, because empirically show what is possible to reach by simply using the qualitative knowledge of social media use. Results show that the correlation doesn’t exist between Facebook and Twitter (in this case the correlation is \(C(x,y) = -0.011\)), nor between Facebook and LinkedIn (\(C(x,y) = -0.011\)), while between YouTube and Facebook is negative (\(C(x,y) = -0.3\)). If we consider the augment of Twitter followers (= \(x\)) and the increase of YouTube visualizations (= \(y\)), is possible to underline a correlation between the two factors (\(C(x,y) = 0.69\)).

**MANAGERIAL IMPLICATIONS AND RESEARCH LIMITS.**

Whereas, therefore, the web experience is based on the exchange, sharing and collaboration, consumers of luxury in mature markets are certainly not been immune to this revolution. Instead, they need to share their passion for luxury brands with other users on the network and trust you more and more of the opinions of the latter “acquaintances unknown” within the forum or blog. This is what literature sustains (Okonkwo, 2009): since the luxury is an identity, a concept – rather than a good or a service – luxury firms have to face the internet challenge if they want to lever on the emotion and they want to share their philosophy and their emotional values (Okonkwo, 2009) strictly tied to the brand. The existing literature (Campbell, Pitt, Parent, Berthon, 2011) can help managers in understanding that even in these particular markets it is possible to use democratic tools like internet and social medias, in order to improve values sharing and audience commitment, but little has been written concerning the concept of polarization of consumer behaviour. This should be considered especially in the areas of luxury, as it allows management to assess the intake of new strategic levers able to lead to the creation of a stable long-term relationship with their target. The results of this research can serve as a framework for all organizations wishing to compete in the luxury good markets. It considers that, especially in this particular competitive environment, consumers are looking for a deep and intimate relationship with brands that emphasize recognition, respect, dialogue and collaboration. On the
contrary, they tend to reject those brands that do not damage their involvement and attention they require. In addition, they tend to abandon those businesses that are not able to convey experiences, values, and, above all, excellent product concepts consistent between the real world and the online environment. In this perspective, the integrated communication takes on an increasing importance in the management of luxury brands.

Moreover, from the integrated marketing communication perspective, luxury markets players have to apply the same logic, but not with the same contents, of the consumer goods ones in the use of media tools. The approach to integration between old and new media is a duty. The integration between old and new media, together with the distribution systems, is strategic on one hand to renovate a luxury brand and transfer to the consumer the sense of modernity and innovation of the brand and, on the other, to build long lasting and strong relationships based on trust, able to provide customer loyalty in a second time.

Generation Y is more prone to web and social communication (CENSIS, 2013) and, more in general, young people used, nowadays, to spend most of their time online represent that part of the population between 15 to 20 years will be able to be a part of the demand for luxury. Even nowadays young people with money to spend are a significant test target for luxury player if we consider that this target is global, strongly attracted and influenced by luxury brands, innovative and it has an occasional access to the consumption of luxury goods.

The research presents some limits that can be turned in further steps. The biggest is that it is necessary to test luxury global users perception, whereas in mature markets perceptions and media habits may differ from those in other geographic markets. The use of a survey through which you are unable to test a sample of the world population, which well represents the universe to be tested, will be the next step of the research. This will take to reach media habits segmentation, distinguished by geographic area, can be a useful tool for managers of luxury companies.

“CONSUMER BEHAVIOR IN CHOICE OF FOOD AND BRANDING”

Nair, Suja .R; Maram, Hari Krishna

1Jain University, Bangalore, India
2Imperial College of Business Studies, Bangalore, India.

ABSTRACT

Purpose: To understand the conceptual link to consumer food choice behavior and learn on how to add to customer value through branding is proposed.

Methodology: Through a literature review the paper distinguishes the concepts relevant to consumer behavior and branding. The effects of these concepts while analyzing: consumer behavior in general and their food consumption behavior are discussed drawn from studying various research implications.

Findings/Practical value: A number of research studies signifying the influence of the interplay of diverse fields on the consumer behavior in the choice of food and in adding to customer value through branding were identified. The outcomes of these research studies should be of interest to behavioral researchers trying to analyze food consumption behavior among individuals.

Keywords: Consumer behavior, interdisciplinary, diversity, consumer decision making process, brand equity, food conception value, customer value, consumer evaluation of food, branding strategy.

INTRODUCTION

All marketing activities are evolved around the ‘consumer’, the key contributor to the growth of the organization. Consumer behavior calls for the study of human responses to the products, services and the marketing mix elements. Food is one of the basic needs of human beings, a source of nutrition for the body, serving a social and cultural function whose consumption has hedonic value. Trying to understand food consumption behavior is highly complex and very challenging because of the diverse influences of a wide range of science and social science disciplines. Over the past many decades there have been tremendous changes occurring in the pattern of consumers’ food choice behavior, visible in the way they go about food shopping and seeking eatery options. This has resulted in organizations opting for modifications in food production, processing and distribution.

In the context of globalization today, we have tried to examine studies involving food choice among consumers from different places. The purpose of this paper is through analysis of various studies develop a framework of food choice behavior and further evaluate the extent to which branding can
influence choice of food. The structure of the paper is as follows. The paper commences with a brief discussion on the terms ‘Consumer Behavior’ and ‘Food Choice’ and then an over-view of few studies will help to identify factors affecting food choice. We will then examine certain studies involving influences on food choice behavior and through discussions try to ascertain whether branding can influence food choice among consumers. Towards the end of the paper we have attempted a framework that will show the link between factors influencing food choice and branding.

In short, through discussions and analysis we propose to seek answer to the question whether branding can influence and add value to consumer food choice behavior.

‘CONSUMER BEHAVIOR’ AND ‘FOOD CHOICE’

Consumer Behavior, has been defined as the decision process and physical activity individuals engage in when evaluating, acquiring, using or disposing of goods and services (Loudon and Della Bitta, 2006).” The conceptual analysis of consumer behavior is greatly characterized by its interdisciplinary (namely, the fields of Philosophy, Psychology, Sociology, Anthropology etc.) nature. The study and analysis of the purchaser’s behavior is mainly centered on three variables: the process of decision making in purchasing, factors influencing the purchase behavior and the one of the consumer (Rabontu and Boncea, 2007). Involvement of the many variables and their tendency to interact and influence one another makes the study of consumer behavior very complex. So, typically, models or frameworks of consumer behavior are developed and used to deal with this complexity.

This paper will focus on Food Choice, which refers to the human eating behaviour or food selection expressed in terms of what food people like and choose to eat. We will briefly examine few studies that have identified factors affecting food choice among individuals.

- Sheperd’s study (1985), states that factors affecting food choice can be divided into three:
  - Food (physical/chemical properties, nutrient content)
  - Person (Perception of sensory attributes, psychological factors-personality, moods)
  - Economic and Social (Price, availability of brand, social /cultural-attitudes)

- Steenkamp (1993) felt that any comprehensive analysis of food consumption behavior mandates taking into consideration the interactions between three types of determinants or factors, namely, properties of the food, factors related to the person and environmental factors.

Properties of the food include the physical and chemical properties and nutrients content (physical form, macro nutrients proportions, fiber contents, energy value) and specific substances (sugar, seasoning, salt etc.). Factors related to the person include biological (for instance, sex, age, body
weight), psychological and personality factors. Environmental factors include socio-cultural, economic and marketing factors.

- Popkin, Duffey and Larsen’s study (2005), illustrates environmental influences on consumers’ food choice, physical activity and energy balance. The environment includes macro and community level factors at the external level i.e. economic, legal and policy influences. It also examines ways in which the external environment affects food choice and diet, physical activity and obesity issues among the larger population.

From the above studies we propound that factors which typically affect consumers’ food choice are: (a) the food product, (b) the individual person and (c) certain external environmental factors. These factors could influence the decision making process which will then lead to the consumer making a food choice. For instance, assume a family of four visits a ‘Pizza Hut’ outlet to try out the food offerings there. Their final choice of food will greatly depend on the offerings (its nutritional content), the persons (their age, health consciousness and gender) and external environment factors (culture, social background, price value equation, etc.).

![Diagram of factors affecting consumer's food choice]

**Figure 1: Factors affecting consumer’s food choice**

**STUDIES TO EXAMINE INFLUENCES ON CONSUMER’S FOOD CHOICE BEHAVIOR:**

The consumer behaviour discipline works on the assumption that to be successful, organization’s must determine the specific needs and wants of their targeted market and deliver the desired satisfaction better than competitors (Schiffman and Kanuk, 2005). The study of consumer behavior is complex because of its multidisciplinary approach. An early attempt to illustrate this can be traced to
the Self–Concept theory (Grubb, Grathwohl, 1967) which laid the theoretical foundation of a model of consumer behavior by examining the relationship between the psychological characteristics (an individual’s self concept) and the symbolic value he associates to the goods he buys. Tybout and Hauser’s study (1981) called for the creation of a marketing audit based on a conceptual model of consumer behavior which can be used for evaluating marketing strategy decisions. [Marketing audit is a comprehensive assessment of all angles (both internal and external influences) of marketing operations in an organization]. The findings suggest that by measuring the variables in the model and mapping their relationships, the managers will be able to identify strategies for altering consumers’ behavior and subsequently evaluate the impact of these also. Another popular representation of consumer behavior is depicted in the Engel, Blackwell and Miniard ,1982 model ,(Loudon and Della Bhitta, 2006) which suggests viewing consumer behavior as a decision process comprising of five activities (motivation and need recognition ,search for information, evaluation of alternatives, purchase and outcomes) which occur over a period of time.

Analyzing food choice behavior:

While embarking through various research studies attempting to analyse food choice among individuals, one can gain a perspective on the evolving consumer behavior.

- We start by briefly going through few studies wherein the researchers’ attempt to analyse consumer food choice on the basis of a certain framework or model.

* The Meulenberg and Steenkamp study attempted to analyse consumer behavior with respect to food through interplay between behavior and economic research of consumer food choice. Such integrated approaches permitted the researchers to link the behavioral concept to the economic concept characteristics and further extend the findings of the research to more actionable marketing research such as product development.

* Consumers are very much concerned about the quality and safety of the food they consume revealed a study (Chang, Tseng, Chu, 2013). This study involving consumers from Taipei, in Taiwan attempted to examine the role of a food traceability system that can create value in food exchange. The European Union (EU) General Food Law Regulation defines traceability as,” the ability to trace and follow a food, feed, food-producing animal or substance through all stages of production and distribution” (ibid, p.1362). The study used a modified 3M framework to examine the relationship between consumer personality (elemental, compound, situational and surface traits) and a food traceability system. The findings revealed that consumers with elemental traits of ‘openness, conscientiousness, extroversion and material and body needs’ presented the two compound traits of ‘need for learning ‘and ‘health consciousnesses’. The latter traits influenced consumer ‘concern for food value’ and ‘perception of food traceability labels’.

The Future of Entrepreneurship

The following studies substantiate that consumer food choice is greatly influenced by the interplay of certain variables and external factors.

* Steenkamp's study (1993) on the basis of review of literature had made a classification of the determinants of food consumption behavior by concentrating on a single or few related factors. This study suggests that researchers from consumer behavior discipline (because of its interdisciplinary background) need to take a broader approach by integrating determinants from several categories. For instance, examine how physical characteristics of the product and social/cultural factors together can influence perceptions on food? How the interactions between cognitive and cultural and physiological induced effects can affect food choice and so on.

* Luomala's study (2004) with reference to Finnish consumers, emphasized on one food attribute factor, namely, meaning that consumers attach to 'the origin-of-food', which would influence their decision making especially in terms of their attitude, evaluation, willingness to buy and choose food.

* A study by Pliner and Mann (2004) tried to examine the effect of social influence and palatability on food choice and the amount of food consumed. The experiment revealed that social influence manipulation had no effect on participants' food choices with most of them choosing the palatable food. The findings of the study highlighted the importance of palatability in food eating behavior. The study demonstrated that when individuals were asked to select from two foods, of which they would eat a moderate amount, (informational) social influence was ineffective in inducing them to consume the unpalatable food.

* Popkin, Duffery and Larsen's study (2005) had examined the environment (in the external context including both the macro and community level) factors that influences the diet and physical activity, causing health disparities among the U.S. population. These researchers emphasized on the need to foster interdisciplinary approaches as well as develop an understanding of the factors that mediate and moderate the association between the environment, physical activity and health outcomes.

Thus, the above studies demonstrate that marketers will need to examine the efficacy and impact of the various factors which influence consumer's choice of food when initiating marketing of food products.

* There has been a growing awareness among consumers about the benefits of healthy eating. Such health conscious consumers seek to evaluate the nutritional content value and healthy benefits when making food choices. This aspect is illustrated in the following studies which will throw more light on how consumers make healthy eating choices.

*Bui and Kemp's study (2011), attempted to examine variables that are crucial in the brand building process especially for 'healthy' brands among USA consumers. The findings indicated three essential
variables: brand credibility, commitment and connection, to be of utmost importance for the development of branding strategies for such “Healthy Brands”.

*Bui, et al.’s study (2013) tried to evaluate how parents in the US make food product choices for their children by looking into the nutritional information provided on the label. The findings of the study indicated that parents are more likely to choose healthier options for their children when a food group information system (providing specific nutrient claims complementing a nutrient claim) is utilized.

*Walsh’s study (2014) involving North America University students tried to examine whether priming a healthy eating goal can cause depleted consumers to prefer healthier snacks. This research implied that associating brands with health related claims may or may not affect the consumer food choice, which was dependent on the state of depletion of the consumer. I.e. when consumers are depleted, health related claims are unlikely to have an impact, whereas, in a state of no depletion it is more likely that health related claims affect their food choice.

*Wang’s study (2013) involving undergraduate students from Northern University, Taiwan, tried to investigate consumer attitudes towards visual packaging and its hierarchical impact on perceived food quality and brand preference. The results showed that attitudes towards visual packaging directly influence consumers’ perceived food product quality and brand preference and indirectly influences food product value.

The above section of studies imply that with the growing segment of health conscious customers, food manufacturers and marketers need to re-work their product lines and visual packaging to create ‘healthy versions’ of product brands through effective communication and brand management systems.

➢ With advances in the field of Science and Technology it is likely that consumer food choice will be more evolved in the future. This mandates food marketers to work towards creating good food retail experience and value consumption for a long term growth. The following studies will illustrate how food marketers can work towards this.

*Saarijarvi, Kuusela and Rintamaki (2013) through a case study of a major Finnish food retailer attempted to explore and analyze how Internet based service applications can facilitate customers’ post-purchase experiences in food retailing context. This type of service application provided customers four distinct types of information including: Playing, Check-pointing, Learning and Goal orientation, which facilitated their post-purchase food retail (utilitarian or hedonic nature) experiences and the degree of transformation varying from low to high. Such experiences not only generate positive word of mouth but can pave the way for long term loyalty too.

*Dagevos and Ophem’s exploratory study (2013), worked towards the development of a consumer centred concept of value in the field of food i.e., Food Consumption Value (FCV). FCV encompasses
four elements; Product value, Functional value, Process value and Ethical considerations along with Location value and Emotional value. The study propounds viewing value of the food market beyond its traditional ‘nutritional aspect’ and ‘value for money’. It suggests that feelings a food can arouse are valuable intangibles and very crucial for value creation and building competitiveness in the long run. Thus, marketers need to strive towards creating post-purchase positive experience and customer centric value in food consumption for a long term growth.

**CAN BRANDING INFLUENCE FOOD CHOICE BEHAVIOUR?**

How a brand is identified from the consumers’ perspective is the core of a good brand building program. Generally, the power of a brand name is referred to as brand equity. Aaker referred to brand equity as a set of brand assets and liabilities linked to a brand, its name and symbol that add to or subtract from the value provided by a product or service to a firm and/or to that firm’s customers (Sheth and Mittal, 2003, p.399). For the investors, brand equity will be the brand evaluation measured as the financial worth of a brand name. While, for the customer, brand equity will be the value of the brand when compared to that of the competitor’s brands.

- We will now examine few studies to determine whether branding can influence the choice of food behavior among individuals.

* Firms need to work towards effective brand building and management because there exists a symbiotic relationship between brands and the cognitive behavior of consumers (Rajagopal, 2006).

* Kathuria and Gill’s study (2013) in India revealed that while a majority of consumers had brand awareness of branded rice, only half of them were aware of branded sugar. Since the factors influencing purchase of selected branded commodity food products were flavour, aroma and absence of the usage of insecticides/pesticides and adulterants, the researchers felt that marketers need to work towards creating brand awareness among consumers and frame marketing strategies for different market segments based on demographics.

* A study to understand ‘Adapting to slow food movement and brand management’ (2012) and Massa and Testa’s (2012) study highlighted the role of ideology in brand strategy with reference to large scale food retailing in Italy. The study concluded that a strong and effective communication retailer ideology that is shared with consumers, who in turn are also asked to participate in the construction of meanings of the retail setting (store layout), can work out to be a powerful tool in brand strategy.

* While trying to explore the antecedents in a hedonic consumable product such as the chocolate market, it was found that brand satisfaction is the most significant factor for brand loyalty followed by brand value and brand equity (Kuikka and Laukkanen, 2012). This study further indicated that testing
of the moderating effect of the hedonic value showed brand satisfaction on attitudinal loyalty to be significantly stronger among consumers with high hedonic value when compared to consumers with low hedonic value.

*A study to analyze the relative importance of brand-packaging and taste in affecting brand preferences for manufacturer and store brands in food product categories indicated that once the product is consumed taste is the strongest attribute determining the choice of the preferred stimulus and influence of price and product brand packaging are specific to the product category analyzed (Mendez, Oubina and Rubio, 2011).

The above few studies on the relevance of branding for food products indicate that creating brand awareness, the role of ideology, brand satisfaction, taste, price and packaging duly influence food brand choices. The broad purpose of a brand strategy is to identify ways to develop brand satisfaction among consumers, which will then lead to brand loyalty and ultimately result in brand equity in the long run.

On the basis of the discussions in the paper reiterating the complexity and interplay of the various factors and variables affecting consumer food choice we have attempted at developing a framework which will show how branding can also be used as an aid to the consumer decision making process in this regard.

![Diagram showing the variables influencing food choice and consumer decision making process](image)

Figure 2: Framework linking factors influencing consumer food choice and branding.
From the above framework one can see that the variables influencing food choice affect consumer’s decision making which results in them selecting or choosing the food. This can be observed and used by the firm to work out a branding strategy aimed at increasing customer value, satisfaction and loyalty. Another view suggests that an awareness of the variables influencing consumer food choice and affecting their decision making can be used by the firm to plan a branding strategy which can influence consumers’ food choice resulting in enhanced customer value, satisfaction and loyalty in the long run. This reiterates that food marketers can use branding to effectively influence consumers food choice behavior positively.

CONCLUSIONS AND LIMITATIONS

The above discussion have conveyed that analysing consumer choice of food is highly complex involving the interplay of many variables such as health and nutrition, social and other environmental factors, informational (food labels and packaging) and post-purchase retail experiences. Nevertheless, an understanding of the impact of the various influences can be used by food marketers to work out a suitable branding strategy and create customer (brand) value for their products.

A limitation of this paper is that all discussions and analysis have been done on the basis of secondary research data. A primary data survey would have helped to learn more on the current happenings in this field of study and also substantiate whether the earlier findings hold good even today. Another limitation is that although attempts were made to refer to studies from various regions, it was not possible to obtain much information from many of the developed countries (other than a few) and even from emerging and growing economies such as Asia (barring a few), the Middle East and African countries. Even though consumption of food is a basic need, the social and cultural variations amongst different regions will affect the way it is consumed. So as to obtain a broader perspective, analyzing food choice behaviour of consumers from across the world would be interesting. Today, when the world is referred to as a global village and marketers are seeking to expand their market across seas, it will really be interesting to learn more on the variations in food choice among consumers across various regions, and this also can be an area of probing and researching in the future.

ESTABLISHMENT OF THE NATIONAL PROGRAMME OF
VOCATIONAL GUIDANCE IN LITHUANIA: CHALLENGES AND
PERSPECTIVES

Nazelskis, Eugenijus¹; Laurinaitis, Arūnas²

¹Vilnius University International Business School, Lithuania
²Lithuanian Confederation of Industrialists, Lithuania

ABSTRACT

In Lithuania, where its economy is recovering from crisis, many industrial enterprises encounter sharper increased shortages of qualified workers. However, in most cases, this shortage in the country’s labor market is not around some one particular occupation that raises selectively the requirements for human qualifications in knowledge, health, or psychic particularities, but for multitude of popular vocations, such as for long-distance drivers, welders, cooks, etc.

The national labor market frequently encounters paradoxical situations; during times of high unemployment and expanded educational levels employers ask the state for permission to import third country specialists because of deficits in many vocations. For some occupations such shortages already existed for several years with no indications of future improvement. Balancing the demand and supply of skilled workforce in the labor market is a challenge of vocational guidance. Current skills mismatches in the labor market indicate, that the currently applied national program for vocational guidance in the national education system is not able to solve these skills mismatches. This prompts the search for ways and means for improving the situation.

This article, while seeking to achieve a balance between supply and demand as well as rational utilization of available human capital, analyses the causes of the continuous deficit of skilled workforce in various fields. It also will provide recommendations to correct the situation.

Keywords: Vocational guidance, human resource management, skills mismatches, labour market

INTRODUCTION

The relevance of the subject theme is based on the contemporary situation in Lithuania’s labor market, characterized by asymmetry and disproportion between supply and demand of workforce, because there is a surplus of some specialists and a shortage of others. Furthermore, contradictory situations
appear, when despite of high unemployment and big supply of educated workforce employers ask for state’s permission to import middle level professionals (drivers, welders, cooks, etc.) from the third countries, because such skilled workers can not be found in the local labour market. Such shortages exist in Lithuanian labor market for several years now with no visible indications of change in the future.

At the same time statistical data indicate that one fourth of university and college level graduates in social science studies are forced to take jobs as common laborers upon their arrival in the labor market. Among the graduates in engineering manufacturing and processing studies this index reaches almost a half, while among graduates of agricultural and veterinary studies it reaches 60 percent (Lithuanian Labour Exchange, 2014). The number of the graduates of universities going to the initial VET schools for retraining is also increasing.

According to data of the Ministry of Education and Science, 423 graduates of higher education entered vocational schools: 222- university graduates, 201 college, while in year 2012 such number of people almost doubled - it grew to 812, who have diplomas of higher education, 464 of them are university graduates, 348 – college (Jukneviciute, 2013).

However, the situation, where most people work below their qualifications can last a long time, since experts note that young people are not reacting to the labour market needs and tend to make the same preferences in choosing their fields of studies to become economist, lawyer, psychologist, business administrator, manager. They face the biggest risk of unemployment. One of the reasons of this situation is that a significant part of young people choose their vocational pathway without prior evaluation of the employment possibilities. Therefore it is not surprising, that a major part of young people having attained higher education degree, but unable to find jobs must re-qualify and often end up looking for work outside Lithuania, choosing the life of emigrants.

All this urges us to study and analyse the reasons for evoking deformations in the market place and in utilization of human capital as well as to search for ways and means to correct the situation.

Vocational guidance plays crucial role in dealing with labour market mismatches in many countries. Effective vocational guidance can act as a remedy of existing skills mismatches (when it is provided to the unemployed persons), but it’s most important target should be prevention of structural unemployment by directing youth to the vocational pathways providing qualifications that are in demand in the labour market. We claim that strategic and long-term prevention of structural unemployment and skills mismatches requires systemic national programme of vocational guidance with the key role played by employers. In this paper we will try to provide the arguments for this statement by analysing of the role of enterprises in the process of vocational guidance, disclosing the attitudes of enterprises to their involvement of in the vocational guidance and providing arguments
for the establishment of the national programme of the employers led vocational guidance.

To solve the above tasks the were applied different research methods:

a) Systemic analysis of the different factors and features of the involvement of enterprises in the vocational guidance based on the desktop research.

b) Analysis of available statistical data.

d) Empirical research consisting of: 1) Interviews with employers and leaders of asociated business structures; 2) Questionaires for surveying of leaders in associated structures.

Interviews were performed in three economic sectors:

1. Transport.
2. Metal processing industry.
3. Information technology.

THE ROLE OF ENTERPRISES IN THE PROCESS OF VOCATIONAL GUIDANCE

The role and importance of enterprises in choosing vocation and, in general, in vocational guidance becomes apparent when an individual at some point has to find answers to himself: what I want to be? What path in my life I should take? And what profession or occupation I should choose?

The answer is not an easy one as choice of a profession or occupation is a complex and responsible individual psychological act. It results in huge psycho-social consequences not only to a person himself, but also the entire society.

Occupational choice and it's subjective and objective factors are the central objects of vocational guidance and it’s research. Choice of occupation or profession involves numerous contradictions and conflicts between the objective factors defined by the labour market demand and subjective factors, that are defined by the needs and intentions of learners and employees. Theories of psychology, sociology and education science focus on the different aspects of these factors and involvement of enterprises in the vocational guidance process. For example, the theory of occupational choice offered by Parsons is focused on the fit of the personality to the work environment, while the theories of dynamic personality are focused on the complex interdependencies between the dynamic change of personality and the process of the choice of occupation or profession. Very similarly, the theories focused on the structure of personality (Axelrod, Ginzberg, Ginsburg, Miller, Super), motivation (Maslow, Vrum) and individual’s choices (Holland, Tyler) stress the complexity and changeability of personality as the key factors in the choice of occupation or profession. These theories also bring the concepts of occupational choice oriented to the personality and subjectivity, such as the concept of casual occupational choice, internal impulse of the occupational choice (Yolland), free development of
personality (Holland, Ginzberg, Super). Obviously, these theories and concepts considered the role of enterprises as secondary factor in the process of occupational choice led by the persons. Very different attitudes to subjective and objective factors of vocational guidance were typical for the theories and concepts developed by the scientists from the former Soviet Union. The concepts of human existence developed by Vygotski, Rubinstein and Leontiev placed socially useful work at the center of human existence largely ignoring the personal needs and interests of humans. Such theoretical assumptions largely influenced development of vocational guidance in the Soviet Union.

Lithuanian scientist L. Jovaiša has developed psychosocial theory of vocational guidance targeted to the optimal usage of personal resources in the vocational training and subsequent work. He discerned three main factors of the occupational choice: 1) requirements of occupations and professions, 2) demands of economy and labor market; 3) vocation of person for certain work or occupation. This model of vocational guidance is rather similar to the model proposed by S. Fukuyama, who discerned the following factors of mature occupational choice: 1) self-analysis of the personal features and resources; 2) knowledge and awareness of the world of work; 3) introduction to occupation and its requirements by practicing the concrete occupations. All these factors require systemic pedagogical support. For example, young people need methodical guidance and help from teachers in performing self-analysis of their personal features and resources. Equally so, in analysing the requirements of work and occupations young people need both access to information about occupations and consultations provided by the teachers and professionals. Referring to the models of vocational guidance proposed by Jovaiša and Fukuyama there can be discerned several types of requirements of systemic vocational guidance related to above mentioned factors: work process requirements, labor market needs and personal vocation for the occupation. These requirements present different implications to the involvement of enterprises in the vocational guidance. Referring to the work process requirements there can be discerned availability of information about the work processes and monitoring of the changes of work processes. Effective vocational guidance requires access to comprehensive, systemic and regularly updated information about the contents of work processes in the different occupations and professions. Availability of such information can be ensured by the different measures and instruments, such as occupational standards, national and sectoral databases of occupations and qualifications, catalogues and registers of occupations and qualifications (for example, national repertory of the descriptors of occupations in France – ROME, or the open system of information and guidance on occupations and qualifications AIKOS in Lithuania). In spite of the domination of the national governments in designing and implementation of these measures in many countries, the involvement of enterprises and social partners by providing information and expertise is of crucial importance for the quality of these measures. Monitoring of the occupational change also
requires solid and concerted efforts of research institutions, enterprises and other social partners. It ensures relevant updating of the information about the work process requirements, what is of crucial importance for vocational guidance in the current context of fast changes in the world of work. Referring to the factors of vocational guidance related to labour market needs, there can be discerned labour market forecasting and exercising influence to the development of labour market needs. Effective vocational guidance requires reliable information about the labour market changes, that can be provided by systemic and regulative labour market needs forecasting. In the nowadays conditions of the fast and unpredictable social and economic change labour market forecasting is very often undervalued and it’s reliability is doubted. However, despite of it’s multiple limitations, labour market forecasting is absolutely indispensable not only for the long term labour market policies and strategies, but also for the vocational guidance. Relevance and reliability of labour market needs forecasting highly depend on the involvement of employers in this process on the enterprise, sector and national levels. National and European strategies of the knowledge-based economy often require from the state and social partners to take more responsibilities and to make more efforts to improve the quality of employment and to enhance the demand for high-quality and knowledge intensive jobs. Enhancement of the demand for such jobs is perceived as a key factor for development of competitive economy. Referring to the factors of vocational guidance related to personal vocation, there can be mentioned orientation of the educational process to assistance for learners to discover their personal vocation and to strengthen it. This orientation requires from educational institutions to become more open to the world of work by establishing stronger cooperation with enterprises and involving the skilled employees and professionals in the educational process. Implementation of the competence based paradigm in the education process also fits to this purpose. Providing to young learners systemic pedagogical and psychological support in discovering and nurturing their personal vocation becomes very challenging undertaking for general and vocational education providers in the context of dynamically changing occupations, work processes and labour market. It requires to restructure the education process by including different propaedeutic and work-based learning measures.

Development of vocational guidance can be based on the different methodological principles, that can even contradict each other. Hupfer and Spöttl (2014) discern the principles of vocationalism and employability. The object of vocationalism is development of an occupational identity through mastering of the professional domain, while the principle of employability is focused on the market oriented dispositions and attitudes that ensure the competitive features of person in the labour market. This principle is based on the assumption of the domination of economic organisation of work and disregards educational and vocational-pedagogical principles of the work and it’s organisation.
These two principles, if taken separately, lead to the different models of vocational guidance. The principle of vocationalism requires comprehensive and hollistic vocational guidance based on the systemic consideration of the different subjective factors, such as needs of development of personality and occupational identity, ethical and moral aspects of work. Vocational guidance ruled by the principle of employability will be more focused on the requirements of workplaces and orientation to the „objective“ requirements of workplaces to the performance, such as concrete sets of knowledge and skills to perform the work tasks. It turns to the different roles and involvement to the employers in these models. In the model of vocational guidance based on the vocationalism, the main role of employers is active participation in the educational process by providing the comprehensive information about work processes, involving skilled employees and experts in the preparation and execution of vocational guidance measures, designing and implementing different propaedeutic and apprenticeship measures and events in order to disclose to young people the hollistic picture of work processes and professionals. Enterprises treat their participation in the vocational guidance not only from the point of view of their business interests, but also from the point of view of public social responsibility. In the model of vocational guidance based on the employability the enterprises participate in this process by „marketing“ their offered workplaces and presenting the requirements of skills, competences and qualifications. Here the participation of enterprises in vocational guidance processes is more strictly based on the current needs of recruitment and human resource management.

2. INVOLVEMENT OF BUSINESSES IN CAREER GUIDANCE

The problem of the shortage of skilled workforce in specific sectors of economy of Lithuania has been discussed for a number of years. Interestingly, the biggest shortages of skilled workforce is noticed in ordinary and middle skilled occupations, rather than any specific or unique professions with special requirements for skills and competences.

The number of work permits issued to foreign nationals in the Republic of Lithuania indicates the shortage of skilled workforce and its extent on the domestic labour market. The data are provided in Figure 1 below.
Fig. No. 1. Number of work permits issued to third-country nationals

According to the data contained in Figure 1, in the recent decade, the number of work permits issued to foreign nationals in Lithuania has been significantly growing, and it has already reached a four-digit level. This causes concern, however, one should also remember that third-country nationals are employed only in the sectors that face the shortage of professionals from Lithuania and EU member states. According to the data of the Lithuanian Labour Exchange of 2010, long-distance drivers, hull assemblers, welders and cooks (Foreign Nationals in Lithuania, 2011) were in the highest demand.

In terms of the shortage of certain occupations, the labour market situation, from a time perspective, continues to deteriorate, as the gap between the supply of and demand for the lacking occupations is still widening. The number of work permits for specialists of different occupations (especially the truck drivers) is rather important (Figure 2).
Fig. No.2. Distribution of work permits issued to foreign nationals in the Republic of Lithuania by occupation, 2012

In 2012 alone, Lithuania issued 4,125 work permits to these third-country professionals. Admittedly, the demand for cargo truck drivers might be still increasing in the future, as in 2011 alone 6,300 cargo truck driver job vacancies were registered for international carriage of goods, and only 1,100 of these were filled by Lithuanian drivers (Kleinauskas, 2012). At the same time, statistics reveal that, at present, two thirds of long-distance cargo truck drivers are aged between 40 and 60. (“Mercedes-Benz” Intends to Tackle the Shortage of Drivers by Using Innovative Methods). The ageing of cargo truck drivers also causes concern over the sufficient number of these professionals in the future.

With the widening gap between supply and demand, the domestic labour market situation is also becoming more complicated in relation to welding professionals. Statistics show that the labour market demand for welders was increasing even under the conditions of economic crisis: in 2009, 2010 and 2011 there were 1,700, 2,400 and 3,000 welding job vacancies respectively (Suvinio nuo emigracijos nesustabdo ir 4 tūkst. Lt atlyginimas, Delfi, 2012).

Above described situation enhanced to carry out research in order to clarify the reasons for the persistent shortage of individual occupations on the labour market and to explore the involvement of companies in vocational guidance.

In February 2014 there have been interviewed representatives of the several sectoral associations of business enterprises. These include: (1) Lithuanian National Road Carriers Association “Linava”, which at present joins 954 carriers – transport companies owning around 20,000 commercial vehicles for international carriage of goods and approximately 3,000 buses and trolleybuses for carriage of
passengers; (2) Lithuanian Welders Association that unites representatives of the welding industry (machinery production, metalworking) - there are approximately 700 companies engaged in welding technologies; and (3) National Association of the Information and Communication Technologies (ICT) Industry “Infobalt”, which currently unites 138 Lithuanian ICT companies and research and education institutions. These companies and organisations employ over 10,000 ICT specialists.

It should be noted that the ICT industry it suffers from a dramatically widening gap between supply of and demand of skilled employees. Data contained in Figure 3 (Brazauskas, 2011) show the shortage of ICT specialists and the perspectives of meeting the demand.

![Fig. No.3: Training of IT professionals and their demand in the domestic economy](image)

In 2011-2016, the gap between the supply of and demand for ICT specialists will reach 6,000. This estimate does not consider possible increase in specialist mobility and entry of potential investors to this Lithuanian sector, which might widen the gap even further.

The data contained in Figure 3 reveal that the gap on the labour market between the supply of and demand for IT specialists is further widening. In 2011-2016, the shortage of IT specialists is expected to reach 6000. Lack of skilled employees hinders the promotion of investments in the country’s economy and impedes the development of economy and individual industries.

Research was primarily aimed at establishing the groups of professionals that were the most required in the above mentioned sectors.

The data obtained were systematised on the basis of Lithuanian Classification of Occupations. They are provided in Table 1 below.

**Table No.1. Number of lacking workers by professional group**
Statistics provided in Table 1 show that three sectors alone need 17,000 skilled workers. This implies that filling these job vacancies would lead to a significant decrease of the unemployment rate in Lithuania. On 1 February 2014, the unemployed registered with local labour exchange offices numbered 210,900. They accounted for 11.5% of the country’s population of working age, including 111,700 unemployed males and 99,300 unemployed females. On 1 February 2014, there were 24,000 registered young unemployed persons under the age of 25. (Lithuanian Labour Exchange, Information, 2014).

Some labor market forecasts failed in detecting the shortage of IT specialists. Although it was estimated that (see Table 1) the requirement of IT specialists would reach 6,000 in 2016, the study shows that already now 10,000 persons are required.

The managers of the above mentioned associations were asked about the reasons for the shortage of workers in their sectors. Taking into consideration the possible variety of causes of the shortage of experts on the labour market, the managers of the associations were requested to name five key reasons for the shortage of skilled workforce. In addition, they were asked to rate their answers from 5 to 1, where 5 points were given to the most important aspect. The data obtained were systematised and are provided in Figure 4 below.

</tbody>
</table>
According to Figure 4, there are 11 main reasons why companies suffer the shortage of workers. Yet, the fact that young persons choose an occupation regardless of the labour market needs is predominant among other reasons. This implies that the responsibility for the shortage of certain skilled workers or specialists basically rests with those who choose their occupation.

However, such a position taken by the respondents raises doubts and a number of questions as to: (1) the objectivity and moral correctness of this attitude; (2) the sufficiency of efforts of businesses to encourage young people to opt for occupations that are absolutely necessary for the country’s economy; (3) extent of the usage of human resources potential in meeting business requirements for necessary occupations; and (4) the need for employers to change their attitude to both young persons and their occupational choice.

Such issues are reasonable and well-founded. For instance, whenever the shortage of cargo truck drivers is mentioned, it is often claimed that this is a male-dominated occupation, and this stereotype is still common in Lithuania. However, in the USA and Canada women working as cargo truck drivers account for 5% of the overall number of truck drivers. Americans admit that they are not satisfied with such situation and target to increase the employment of women in this position to
achieve that women would make at least 10% of total cargo truck drivers. It should be noted that the cases where man and wife, father and daughter, couples, etc. work as long-distance drivers are quite common in the United States. For driving pairs, this is not only the way to earn money, but also the possibility of travelling together, communicating, enjoying their work and life. The United Kingdom, France, Sweden and some other countries even have organisations promoting employment of women for cargo truck driver jobs. Such organisations are particularly successful in Sweden. However, there are no considerations of this employment niche for women in Lithuania. Respondents say, that one of the reasons for excluding such an occupation as an option for choice is distancing from the family. However, the practice of other countries demonstrates that, in a number of cases the occupation of a long-distance driver can unite families rather than to pull them apart.

Reasons related to the quantity and quality of specialist training come in second place. It should be noted that, according to the interviewed business associations, the initial VET schools and higher education establishments fail to meet the needs of quantity and quality of skilled specialists.

In some cases, as for example, in case of welders the graduates of initial VET schools do not have all certificates that are needed for the immediate work after employment. Here the problem lies in the insufficiency of the contents of provided qualifications for the execution of work tasks. It’s no wonder that employers who recruit such persons still need to devote a great deal of effort and money to their further vocational training for them to obtain documents necessary for the job. For this reason, when recruiting staff, employers give priority to persons with all needed qualifications and professional experience rather than young graduate specialists. This partially explains why the problem of youth unemployment persists in Lithuania, though at the same time there is a shortage of professionals in the different fields (like, for example, welding).

The current situation shows that the issues related to training of specialists of specific areas need to be tackled in order to increase youth employment. It could be possibly dealt with through a better cooperation between employers and training institutions and by joining efforts in the preparation of occupational standards and their integration in curricula. Nevertheless, documents and surveys (Nazelskis, Tutlys, 2013) reveal that this kind of cooperation is still rather weak.

Studies of Peter Drucker, a famous American manager and the author of a number of research papers, are valuable in dealing with the sensitive and complicated issue of specialist training. Taking into consideration worldwide social transformations and the role of organisations in transformation processes, this researcher claims that: “Only the organisation can convert the specialised knowledge of the knowledge worker into performance, and the human capital to the structural capital” (Drucker 1994:88). Due to the need of highly skilled workers the involvement of organisations in specialist training become an objective necessity.
Further, the representatives of business associations were asked about their involvement in vocational guidance. The data obtained were systematised and are provided in Table 4 below.

Table No. 4. Involvement of business associations in vocational guidance

Not all associations gave a positive answer to the question about their involvement in vocational guidance. This implies that not all of them are practically engaged in such activities. Since the association “Linava” gave no answer to the successive questions related to vocational guidance, this is a well-founded assumption.

Following the question about the involvement of companies and associations in vocational guidance, respondents were further asked about the forms of their involvement in vocational guidance. Their responses were systematised and are provided in Table 5 below.

It should be noted that the data contained in Table 5 speak of a controversial and interesting phenomenon – companies are convinced that they participate in vocational guidance, but their indicated forms of involvement show that these representatives have rather distorted understanding of the contents of vocational guidance. Bigger part of their indicated measures hardly have anything in common with vocational guidance on the whole or play only a secondary role in the vocational guidance process. In addition, their indicated measures evidence, that vocational guidance provided by economic entities lacks clear structure and focus.

In this context, it is worth mentioning that modern information technologies offer wide opportunities for economic entities to take part in vocational guidance and provision of information about occupations and skills needs. Specifically, the development of specialised websites allows the
provision of information about occupations, their need, prospects and requirements of each specific occupation for human skills, knowledge, health and physiological characteristics.

Also, it should be reminded that persons choosing an occupation, planning their future and seeking vocational retraining should be aware of social and economic aspects of a specific occupation, such as salary rates, social benefits, health implications, cultural and routine conditions, possibilities to attain qualification, training institutions providing required training, etc.

Practice shows that preparation of specialised information publications, articles and radio or television broadcasts dedicated to young persons, parents, teachers, redundant workers and jobseekers are also effective in vocational guidance. These measures, however, are missing in the analysis of the provision of vocational guidance by companies and their associations.

Likewise, the analysis of the provision of vocational guidance by companies and associations shows the lack of an proactive approach of economic entities in the organisation of joint information events with the Lithuanian Labour Exchange for: (a) redundant workers; (b) the long-term unemployed; and (c) persons whose occupation is redundant on the labour market and who thus are unable to find a job according to their specialisation. It needs to be reminded that these groups form a tremendous reserve for the supply of necessary workers.

Further, to ensure the objectivity of the assessment of activities of companies and associations in the field of vocational guidance, informants had to answer the following two clarifying questions: (1) Does your company (association) implement any vocational guidance programme? In response to this question, all respondents frankly admitted having no such programme; (2) How much money do you allocate for vocational guidance? Responses to this question reveal that the Welders Association allocates a considerable amount for vocational education of pupils (up to LTL 200,000 a year), including non-formal education and professional development of teachers (LTL 1.3 million in two years). This association also provides LTL 2.75 million (EU funds, budget funds and companies’ funds) for work with students. However, no funds are specifically used for vocational guidance purposes.

Summarised findings of the empirical research show that individual segments of the Lithuanian labour market are facing a critical situation caused by the shortage of skilled workers. At the same time, the research reveals that economic entities, which should be the most concerned about the sufficient supply of professionals on the labour market, fail to take any part in vocational guidance or their involvement is very limited and episodic.
NECESSITY FOR CHANGING THE ATTITUDE OF ECONOMIC ENTITIES TO VOCATIONAL GUIDANCE AND FOR SPECIALIST TRAINING IN ORDER TO DEVELOP THE NATIONAL PROGRAMME FOR VOCATIONAL GUIDANCE IN THE EDUCATION SYSTEM

Statistics speaking of the shortage of professionals in specific areas of the country’s labour market, first of all, encourage finding ways and measures to rectify the situation; second, it becomes evident that the existent National Programme for Vocational Guidance in the Education System and the vocational guidance system functioning within its framework are incapable of fully ensuring the supply of skilled professionals that are required for the country’s economy and labour market. However, it would be wrong to attribute full responsibility for the current situation on the Lithuanian labour market only to pedagogical vocational guidance provided by education institutions. On the contrary, even from a retrospective view of the history of Lithuanian pedagogical vocational guidance, education workers have significantly contributed to the development of vocational guidance in Lithuania and the global theory and practice of vocational guidance. Their contribution becomes even more visible in the context of vocational guidance in Lithuania and historical changes.

It should be noted that, in vocational guidance, a number of democracies followed the evolutionary path. In our country vocational guidance was altogether banned for a long time. This prohibition was imposed in 1936 by the special resolution of the Central Committee of the Communist Party of the Soviet Union on pedagogical deviations in the people’s commissariat education system. This resolution categorically prohibited vocational guidance research or the use of test methods and stopped the application of any psychological techniques and professional selection.

Following Lithuania’s annexation and incorporation in the USSR in 1940, the abovementioned resolution automatically came into force in Lithuania and was valid until the middle of the last century. As rightly noted by K.G. Pelikian (Пиликян 2009:38-45), a prominent researcher of the USSR history of vocational guidance, this prohibition was lifted in the mid 40’s of the last century owing to the efforts, courage and ingenuity of A.Volkovsky, L.Jovaiša, M.Vinogradova, G.Galkytė, M.Kopanev, B.Uspensky and other researchers who argued for the necessity of training young persons for occupation.

Lithuanian education workers (L.Jovaiša, G.Galkytė, etc.) substantially contributed to the revival of vocational guidance. With the revival of vocational guidance, Lithuanian researchers channelled tremendous efforts into theoretical foundations of vocational guidance, experimental research and practical use of research results. Important contribution in the development of theoretical foundations was made by L.Jovaiša and S.Kregždė, who were destined not only to open the door to vocational guidance, but also to lay theoretical foundations in this area.
While building theoretical foundations for vocational guidance, L.Jovaiša came up with an idea and developed a vision, which is dealing with objectively existent contradictions between the public demand for skilled professionals required to secure the functioning of the country’s economy and the needs, abilities, subjective attitude to work and career choices of a particular person by training and educating of a person and through the personality development. Thus, then prevalent administrative, party and military mobilisation measures, which helped to ensure staffing in a number of cases, were opposed with a tailored education system dedicated to pupils’ professional focussing, development of their ability to choose an occupation with full awareness and assistance in their career choices, when needed.

It should be further noted that vocational guidance, as being closely associated with the need to give answers to complicated philosophical questions about the human being, ideals, values, etc. of the society and of an individual, naturally covers fundamental problems for young people that encourage search for the meaning of human life and allow for real possibilities of achieving one’s life goals. Such responses already entail a number of further questions about human rights and freedoms enjoyed in the country, personal life management possibilities, rational use of human potential in economy and a number of other factors affecting personal and society’s life.

By referring to vocational guidance and personal aspects of career choice, L.Jovaiša found an effective method and measure allowing for: (1) the change of the government’s and society’s attitude to a person; and (2) the extension of human rights and freedoms and a conscious and responsible management of personal life. Conditions were also provided for the commencement and promotion of scientific discussions on critical issues of the social life of that time.

It should, however, be admitted that, regardless of the achievements of the time in vocational guidance, under the conditions of planned economy vocational guidance could function only within a strict framework: it was fully regulated by the state which planned how many persons were to be admitted to universities, higher vocational technical schools (now transformed to the universities of applied science), vocational and technical training schools, etc. In addition, graduates of training institutions were compulsorily appointed to perform certain jobs for a set number of years. As a result, economic entities did not have to take care of staffing or compete for workers, as only a timely application sufficed to ensure the supply of necessary specialists. However, such practice did not stimulate companies and organisations to take part in vocational guidance and created a stereotype that the vocational choice was personal, family or training institutions’ concern.

Further, in Lithuania’s transition from the planned economy to the market economy, vocational guidance received considerably less attention. Young persons were left to make their own choices. In other words, previous achievements in the area of vocational guidance were lost, though nothing new
was created. Naturally, such a vocational guidance situation led to the misbalance on the country’s labour market, which faces severe shortage of some occupations and, at the same time, the redundancy of other occupations.

With the final shift to the market economy, vocational guidance again was brought into focus. High aspirations towards vocational guidance were associated with the National Programme for Vocational Guidance in the Education System approved by Order No ISAK-2332 of the Minister of Education and Science of 3 December 2007. The Programme was revised by Order No V-580 of the Minister of Education of Science of the Republic of Lithuania of 25 June 2013.

Yet, a few years after the approval and revision of the Programme, the labour market situation seems to be even deteriorating with the increasing youth emigration, disproportion between supply and demand on the labour market and the shortage of experts of specific areas.

Naturally, in order to balance supply and demand on the labour market, it is necessary to change the attitude of companies and organisations to vocational guidance, as surveys show that economic entities poorly understand their position, role and importance in terms of the choice of career and vocational guidance, and also its benefits for individuals, economic entities and the society as a whole. Therefore, to make sure that economic entities take a different approach to vocational guidance, it is important that companies and organisations fully understand the advantages of effective vocational guidance. In this context, research data provided by S.N.Kurovskaja (Куровская, 2009:23) are indeed useful. Based on the experience of foreign states and research findings concerning the benefits of career guidance for population and economic entities, she provides the following data: (1) effective vocational guidance reduces the time and costs of vocational training by 2-2.5 times; (2) reduces staff turnover by three times; and (3) increases performance efficiency by 20-30%.

Significant research in relation to the importance of the choice of career and its effect on economic entities is introduced by researcher A.Zaicev (Зайцев, 2011). He conducted research in 2010 after surveying the employed from Western Europe, Eastern and Central Europe and Russia as regards their satisfaction with their career choices.

This research revealed that Western Europeans dissatisfied with their career choices accounted for maximum 15%, the majority of which are workers employed at production facilities. At the same time, such workers in Eastern Europe and former Soviet Union countries accounted for 30%, while in Russia dissatisfied persons aged between 40 and 50 made up to 50%. Notably, a number of respondents openly admitted that they consider their jobs as servitude and that they only perform their duties from 9 a.m. to 6 p.m. and are ready to change their occupation at the earliest opportunity.

The findings of this research make it evident that, from the employer’s perspective, building a team of like-minded individuals, readily investing in staff training and professional development, increasing
corporate performance efficiency, ensuring business stability or reducing staff turnover pose a serious problem, as due to the wrong choice of career quite a significant number of workers look forward to the first opportunity to change the occupation they dislike.

At the same time, it should be admitted that the change of employers’ attitude to vocational guidance and even their good will alone might be insufficient in order to use the available human capital in a rational way and to balance the labour market situation, as the provision of vocational guidance requires special knowledge and abilities to carry out specialised research and use the outcomes in practice.

In other words, in order to meet changing demand of the economy for workers, a number of tasks related to career choices need to be performed by practitioners working in companies and organisations, because it is economic entities, seeking a competitive advantage, who should be the most concerned about the availability of professionals of relevant areas. This is why the engagement of practitioners in vocational guidance is an objective necessity, which encourages companies and organisations to have specialists who are capable of using participatory research based methods and to develop the information and know-how about work processes and occupations.

According to a widely used definition of the modern human resource management saying that “human resource management is understood as a systematic and uninterrupted process aimed at satisfying ever changing staffing needs of a company and at formulating a staffing policy in order to ensure long-term and effective company’s operation” (Чукуреев, Корытова, 2010:14), in modern companies and organisations the responsibility for meeting the staffing needs, as a rule, rests with HR managers. For this reason, taking into account the importance of their professionalism and the necessity of their contribution to vocational guidance, the analysis of the preparedness of HR experts for the provision of vocational guidance is inevitable.

Looking to the position of human resource management within the system of the study fields of higher education in Lithuania, human resource management is not regarded as a separate field or branch of science and makes a part of management science studies. We can assume, that it indicates certain lagging behind of human resource management studies in Lithuania comparing to other countries, where this management area has developed into an independent branch of science, including active research, defence of doctoral theses and award of doctoral degrees in human resource management.

In Lithuania, human resource management studies makes part of corporate management studies (code S190) in the study field Management and Administration. In other words, human resource management studies are mainly focused on individual companies, while the studies of human resource management on the sectoral, regional or national levels remain ignored.
Deeper analysis of study programmes of human resources management reveals, that at present, eight Lithuanian higher education institutions train specialists more or less related to human resource management.

</table>
In terms of the level of provided degrees and qualifications, universities provide study programmes on the (1) bachelor and (2) master level. However, degrees related to vocational guidance are awarded in different areas, including educational sciences, career education or human resource management.

The analysis of study programmes and their descriptions shows that graduates of educational sciences are qualified for work in: (a) a number of education institutions and their management institutions; (b) labour market services; (c) labour exchange offices; (d) vocational and career guidance centres; and (e) staff training and career guidance services of enterprises, firms, companies and other organisations.

Definitely, experts of this area are prepared to engage in vocational guidance. The negative aspect is that the possibilities of using them in companies are highly limited, as there are no large companies in Lithuania which could afford to have their own staff training and vocational guidance centres. Even the major Lithuanian concerns cannot afford experts with narrow specialisation in their HR units due to high costs, as modern HR management units perform a wide range of functions requiring knowledge in a number of human resource management areas.

A similar situation is with career designing experts, who, during their studies, gain fundamental theoretical knowledge in educational sciences, career designing and psychology, required for human resource development in education and labour market systems.

Admittedly, these professionals are very valued by specialised companies engaged in recruitment and selection of employees and providing services to a number of other companies in the country, because these experts are trained to assess personal skills and abilities by using descriptions, tests, surveys, evaluation scales and other methods. In practice, even large industrial companies hire specialised companies for staff selection, because this is more cost-effective than in the case of own experts within the HR management structure.

It may be reasonably assumed that, depending on financial possibilities, the needs of businesses may be best answered by professionals who completed study programmes of human resource management and handling, personnel management and strategic leadership. Yet, these programmes do not cover vocational guidance. This suggests that it would be reasonable to integrate the course of vocational guidance in human resource management programmes in order to balance the supply of and demand for workers on the labour market, as the availability of vocational guidance experts in companies and organisations would allow for further development in the area of vocational guidance.

Conclusions and Recommendations

Lithuanian companies and organisations still have a poor understanding of their position, role and functions in the process and within the framework of career choice and vocational guidance and the impact on the formation, accumulation and effective use of the human capital.
Unless a number of companies and organisations change their focus and approach to the planning of their staffing needs and the stern attitude to vocational guidance, it quite unlikely that the situation on the Lithuanian labour market will develop in a positive way, structural unemployment will decrease on the domestic labour market, the rate of youth employment and the efficiency of the use of human capital will increase and the state will comply with its international obligations.

The research reveals that economic entities, which should be the most concerned about the sufficient supply of professionals on the labour market, fail to take any part in vocational guidance or their involvement is very limited and episodic. It also shows that economic entities neither implement any vocational guidance programmes nor allocate any funds for their implementation.

Current gap between the current supply of and demand for occupations on the labour market is caused by axiological differences manifested in the discrepancies between a personal choice and learning of a given occupation and employers’ needs and expectations rather than by the human factor or intellectual, physical or physiological possibilities of following occupations that are in demand on the labour market.

In order to ensure that economic entities take a different approach to vocational guidance, it is important that companies and organisations fully understand the advantages of efficient vocational guidance. Furthermore, it would be reasonable to integrate the course of vocational guidance in human resource management programmes in order to balance the supply of and demand for workers on the labour market, as the availability of vocational guidance experts in companies and organisations would allow for further development in the area of vocational guidance.

PROVIDING SERVICE QUALITY IN EXCLUSIVE RESTAURANTS: A SURVEY OF DINERS IN THREE RESTAURANTS AT A GAUTENG CASINO COMPLEX

Nicolaides, Angelo

Graduate School of Business Management, University of South Africa

ABSTRACT

A number of studies have established that service quality has a direct impact on a restaurant's profitability. This study made an empirical assessment of customers' perceptions and expectations of service to measure service quality in three restaurants in a casino complex in Gauteng Province in South Africa. The research helped to assess the levels of customer satisfaction with service provision in three restaurants and identified factors that contribute to customer satisfaction and dissatisfaction; it also determined the current status of service and compared and ranked three restaurants service provision. Another importance was the aiding in the establishment of customer service standards for the restaurants concerned. The tipping of waitrons was also used as an indicator of customer satisfaction with service provision in general. A three-column SERVQUAL instrument was used together with part of the Fishbein model. The study was able to firstly determine and analyze service gaps that exist in the service delivery procedure to measure service quality as well as general customer satisfaction and secondly, to evaluate customers' attitudes towards the service measure attributes of similar restaurants in the same location. The findings offer implications to improve service quality in restaurant business in general.

Keywords: Service quality, tipping, restaurants, SERVQUAL, Fishbein model.

INTRODUCTION

In the last few decades, service quality and customer satisfaction have become critically important aspects for restaurant owners and managers to consider if they are serious about expanding our even keeping an existing business. In South Africa there are a number of restaurant chains as well as unique restaurants that resemble what were previously referred to as steakhouses in the period 1960-1980. Hsieh & Wu (2007:1) maintain that service quality is a server’s endeavour that is observable by a diner throughout a service encounter. This will ultimately influence the outcome of the service. When we speak of the quality of service executed this refers to the promptness, friendliness or attentiveness of
the person who is serving (Bodvarsson et al., 2003). Since competition for business is becoming increasingly greater, it is especially managers who try to maintain existing customers while seeking to attract new ones. The aspect which attracts customers the most is service quality excellence. The dining experience comprises tangible and intangible elements. The tangible elements can easily be improved, but the intangible aspects of restaurant service require great attention. Researcher indicates that the ability to deliver high quality service provision will provide long-term financial viability and lead to more sustainable business success (Keiser, 1988). Researchers have postulated that there exists a very strong relationship between customer satisfaction and loyalty to restaurants (Szymanski and Henard, 2001) and the notion that service quality excellence impacts business profits has been apparent for a number of years (Baker & Crompton, 2000; Zeithaml & Bitner, 2000). A study conducted by Bodvarsson et al. demonstrates that predicted service quality significantly affects the size of a tip that a waiter obtains (Bodvarsson et al. 2003; Parrett, 2006). Tipping is considered to be an efficient way of rewarding workers for good work and serves as a major incentive to encourage service quality excellence (Lynn et al., 1993:478; Lynn 2003:140). Consequently, tipping can be used as an indicator of customer satisfaction. This is directly linked to the idea of superior quality of service which is undoubtedly an aspect that can add value to a restaurant’s product offerings and ultimately impacts on a restaurant’s bottom-line as it leads to customer loyalty via repeat visits (Lee, Barket, & Kandampully, 2003). The key purpose of this study was primarily to understand the restaurants’ levels of service quality as per customers’ perceptions of service delivered, the customers’ satisfaction levels with service provision, and thirdly the customers’ assessment regarding other restaurants in the same location. The findings of the research were anticipated to provide useful service quality provision suggestions for the restaurants involved.

**MOTIVATION FOR THE STUDY AND RESTAURANT BACKGROUND**

The research was conducted in order to:

1. assess the levels of customer satisfaction with service provision in three restaurants;
2. identify factors that contribute to customer satisfaction and dissatisfaction;
3. determine the current status of service;
4. compare and rank three restaurants service provision;
5. help establish customer service standards for the restaurants concerned.

There were three restaurants involved in the study. The largest restaurant in the study case, which shall be termed ‘X’, is a privately owned franchise operation which has a large number of restaurants in operation in Gauteng. This operation has 364 seat capacity and 12 waitrons, 15 cooks/chefs, 4 cleaning...
staff, 2 front of house managers and 3 floor managers who may not all work at the same time, but rather in varying shifts. The cuisine served could be considered to be wholesome family meals and the menu has a large variety of dishes. Items on the menu range from pizzas, salads, and farinaceous dishes to antipasto, meat, fish and vegetarian fare. There is also a selection of starters and desserts to choose from. Drinks include coffees, teas, soft drinks and alcoholic beverages. The targeted customers include casino walk-ins, families and friends going out for either lunch or dinner, and from time-to-time, special events such as engagement parties, birthday parties etc, for which an upstairs ‘private area’ seating for 120 is available. This establishment also prepares special breakfast menus for Saturday mornings. This popular brand name family restaurant has appealing furnishings that create a homely ambience and it is easily accessible and pleasant to be in. It is a casual to smart dress code restaurant. Restaurant ‘Y’ has a capacity of 188, with 9 waitrons -4 of whom are seasonal and 3 cooks/chefs. It staffs 3 cleaning staff, 1 front of house manager and 2 floor managers and 4 cleaning staff. Restaurant ‘Z’ has a capacity of 165, with 5 fulltime waitrons and 5 seasonal waitrons. It has 2 chefs/cooks, 1 front of house manager and 1 floor manager as well as 4 cleaning staff. Both restaurants ‘Y’ and ‘Z’ are privately owned and not part of any franchise operation and only a short distance from restaurant ‘X’ both offer various styles of steak and other meals in what are seemingly silver-service cuisine set-ups with high back chairs and stylish candle holders and wine glasses, for example. They would be considered to be luxury restaurants. The menus both include appetizers, soups, antipasto, salads, entrees (steaks), dessert, and a selection of soft drinks and alcoholic beverages. In each of the restaurants, ‘X’, ‘Y’ and ‘Z’, the customers can select whatever they wish to order and thus can create their own series of courses which will comprise their ultimate meal. The style of the decor in these restaurants makes diners feel they should dress up to eat there, although there were a number of casually dressed diners present at the times the research was conducted.

This study will hopefully serve as a practical guideline for the managers of the three restaurants under review, especially the floor managers and waitrons. The outcome of this study will be to further develop the service quality provision of staff in order to satisfy customers’ needs and expectations so as to maintain customer loyalty and enhance profits.

LITERATURE REVIEW

Research clearly shows that it costs a lot more to attract new customers to a restaurant, than to retain existing customers (Oliver, 1999; Rosenberg & Czepiel, 1983). Restaurants in today’s food and beverage industry are thus required to satisfy customers through continuous service quality excellence, and indeed, should do so in any event (Gabbie & O’Neil, 1996). In fact, customers need to be delighted with the service they obtain. Service quality means the difference between the customers’ expectations of
service delivery and their perceived service. The service provided to customers by a restaurant has a huge and immediate impact on the company’s profits since it is directly related to customers’ perceptions of services rendered and to general satisfaction. Repeat business and customer loyalty demand service quality excellence (Zeithaml & Bitner, 2000). What is tricky to determine is which intangible characteristics are most important to a customer (Berry & Parasuraman, 1991). The research aimed at measuring service quality through analysing the tipping of waitrons by customers as well as by attempting to comprehend the perceptions of customers concerning the service provided. Customer expectation refers to uncontrollable factors including past experiences, personal needs, word of mouth, and external communication about service. Customer perception refers to customers’ feelings of pleasure / displeasure or the reaction of the customers’ in relation to the performance of the restaurant staff in satisfying their needs.

The literature suggests that there is a strong correlation between tipping amounts indicating customer satisfaction and repeat business by satisfied customers which ultimately leads to enhanced profitability for a restaurant business (Azar, 2007; Parrett, 2006; Getty & Getty, 2003; Tsang & Qu, 2000). Lynn et al. (1993), considers tipping to be an almost “pervasive consumer behaviour” of significant economic value. As stated earlier, it is vital for a restaurant operation to fully comprehend its customers’ attitudes towards service quality provision, assuming that this is in fact happening (Kandampully, 1997). The customers’ attitudes concerning service provision cannot be measured simultaneously on SERVQUAL five service measure attributes. What can be used here is the Fishbein model.

USING SERVQUAL

The perceptions of the customers in the service process is crucially important as the business needs to be aware if there is any discrepancy between perceived service and that expected by the customers (Parasuraman, Zeithaml, & Berry, 1985). Where there is a clear incongruity this is generally referred to as the service “gap” (Oliver, 1981). Parasuraman, Zeithaml, & Berry, (1985), developed the SERVQUAL model which is still widely used today to evaluate service quality. The SERVQUAL (Gap model) is an instrument used for measuring service quality, in terms of the discrepancy between customers’ expectations regarding service offered and the perception of the service received by them; Respondents are required to answer questions about both their expectation and their perception.

Parasuraman, Zeithaml, & Berry broke service quality down into five dimensions, namely. Reliability, Responsiveness, Tangibles, Assurance and Empathy. They evaluated service quality by subtracting a customer’s score that is based on a perception of the service provider’s performance, from the customer’s expected score. Where customers were satisfied with service quality provision, there has
been higher service quality which resulted in higher satisfaction levels. The dimension of Reliability relates to what is considered to be accurate and highly dependable service provision. Responsiveness relates to the desire of a server to provide prompt service to the customer. The Tangible dimension relates to the equipment used, physical facilities as well as the appearance of the waitrons, for example (waitron is a non-gender specific term for waiter or waitress). Assurance related to the product knowledge of the waitrons, their welcoming attitudes, as well as their ability to be trusted. The Empathy dimension relates to their ability to come across as genuinely caring for the needs of the customers. The scores obtained by using the SERVQUAL model thus represent the variation between expected and perceived service quality. Literature supports the use of SERVQUAL (Gap model) as a valid and reliable measure of the quality of the service for food and beverage operations, for example (Stevens, Knutson, & Patton, 1995; Nel & Pitt, 1993).

THE FISHBEIN MODEL

Ajzen and Fishbein, (1980), developed a model which is based on the hypothesis that a customers’ behaviours are the result of a cognitive process in which they systematically processes all accessible information. This information describes beliefs, attitudes and behaviours for a wide range of attitude measurement. Consequently by using both SERVQUAL and the Fishbein model to evaluate service quality provision levels and satisfaction, the customers’ attitudes can be assessed as an evaluation of a psychological item which is encapsulated in five attributes namely, good or bad, harmful or beneficial, pleasant or unpleasant, likeable, dislikeable (Fishbein, 2000). Such a methodology can help in understanding the attitudes of customers towards a restaurant and also allows for the measurement of these qualities in different restaurants.

The beliefs, attitudes and behaviours of customers are evaluated using the Fishbein Model. Beliefs refers to the knowledge that a customer has concerning objects, their attributes, and their benefits. The objects would include the products (food and beverage), people (restaurant staff), companies, and things about which people hold beliefs and attitudes such as quality service provision. The attributes are the characteristics or features than an object may or may not possess. The benefits include all the positive outcomes that attributes might provide to the customer such as enjoyment of food, relaxing ambience, quality service, value for money etc. It is important to realize that people buy a whole lot of benefits, not product attributes.

The cognitive component of the tripartite model is generally assessed by using a version of the multi-attribute or Fishbein model where:

$$Ao = \sum BiEi$$

and where: $Ao = \text{the overall attitude toward object } o$

$Bi = \text{the strength of the belief that object } o \text{ has some particular attribute } i$
Ei = the evaluation of the goodness or badness of attribute i

In this model, evaluative component consequently serves as something of a weight. The Fishbein model is well utilised by consumer researchers and greatly assists to measure restaurant customers’ attitudes towards the SERVQUAL’s five attributes. It is nonetheless not necessary to adopt its mathematical equation for the research. The model was modified in this research using Solomon’s theory (2002) to suit the requirements of the study, in that consumer behavior is a study of all the processes involved when customers or groups of customers, choose to buy and use, services, ideas, or experiences to satisfy their particular needs and desires. The ‘exchange’ aspect when a customer goes to a restaurant, and when they are given and receive something of value, is a fundamental part of marketing. Consumer behavior thus involves a wide variety of participants. Customers also influence on the buying processes as they tell friends and family about their varied experiences when dining out.

In another model as developed by Bodvarsson et al (1997), it is the waitrons who are requested to report on tips received by them for service rendered to diners as the latter tend to exaggerate on this aspect. Bodvarsson et al.’s suggest that there is a strong two-way causal relationship between the diners’ experience of service quality provision and the percentage of tips received. The waitrons’ expectations of tips to be received has an influence on the quality of service which is supplied and the service quality provision also influences the amount of tip that is dispensed (Bodvarsson et al., 2003).

**TIPPING**

Tipping is a complimentary payment for service rendered in the context of restaurants by customers to waiters, in particular, but is not exclusive to hospitality *per se*. Tipping is generally considered to be a social norm and many diners feel a need to tip because others around them are tipping tip and as such it is expected (Azar, 2005). If diners do not tip, those with them may perceive them to be stingy and they consequently feel pressurised to tip so that those accompanying them will respect them more. Generally speaking then, tipping may be regarded as a social convention that most customers in South Africa would adhere to (Bodvarsson et al., 2003). In a survey conducted by Azar (2007) to assess whether repeating diners’ tips were more sensitive to service quality provision than tips of non-repeating diners, the findings suggested that the tips of repeating diners are less sensitive to service quality provision than the tips of non-repeating diners. Consequently we may say that future service provision as a motivation for customers to tip is not supported by the literature and therefore only social norms appear to motivate tipping patterns. Parrett’s (2006) conducted a study in Virginia in the United States to address the issue of why diners tip and how much they tip. The results demonstrated that age as a control variable, had a marked effect on tip size. Older people tend to tip more as well as more frequently than younger people (Parrett, 2006). Parrett also found that diners who pay with cash
tend to tip more than diners who pay using credit cards. Furthermore, when there were less than 3 diners at a table, tip size decreased; while for tables of more than three diners, tip size increased. Sill (2004) states that service is very important and restaurants should not over-promise and under-deliver. Research in the United States has also indicated that Blacks are less familiar that Whites with tipping norms and this suggests that the Black-White differences in tipping, can be significantly reduced by making customers aware of tipping norms (Lynn, 2006 a).

**METHODOLOGY**

The methodology was mixed, and was thus both quantitative and qualitative in nature. The quantitative data was analytical and it allowed the researcher to arrive at a universal statement. A survey described and explained tipping issues and had a quantitative analysis and questionnaires were utilised.

The qualitative methodology used aim was detail and depth of understanding to demonstrate and understand possibilities, but not necessarily on how frequently they occur but it produced descriptive data, which was generally the participants’ own words pertaining to their experience or perception of service quality provision. The researcher was thus more concerned with understanding rather than explaining. He was seeking novel or unanticipated findings and the theme of the research was essentially phenomenological where the participants’ perspectives were the empirical point of departure. This was basically a focus on real-life experiences. The researcher was able to interpret and describe the actions of various people, including employees and customers. The SERVQUAL instrument as well as the theory of Ajzen & Fishbein, were adopted to achieve some of the research objectives. In addition a seven-item, five-point Likert scale (Question 1) was used to measure the practice of tipping as a social rule in the area. The SERVQUAL was used to measure customer satisfaction with service quality provision, while the Fishbein model was used for multi-attribute attitude assessment.

**SERVQUAL RESEARCH**

The greatest part of the survey was designed on a three-column approach and the five attributes as defined in the SERVQUAL model as postulated by Parasuraman, Zeithaml and Berry (1988). In this approach, a brainstorming session was conducted and the selected group of five employees from the different restaurants met for just less than two hours to discuss and define the variables/factors for each of the five attributes as defined in the SERVQUAL (also known as the Gap Model) adopted. Each of the appointed members were in supervisory positions as front-line servers. As a result of the brainstorming meeting, 35 variables were created and used to illustrate and measure an attribute of the SERVQUAL
model. The factors to be evaluated were included in the survey (Questions 1-5) and each factor was measured on a scale of 1 (extremely low) to 10 (extremely high). The second part of the survey was designed to evaluate SERVQUAL’s five service measure attributes for the respective restaurants. The questionnaire was pre-tested with a convenience sample of approximately 15 customers using a collaborative participant pre-testing method. Data for the main study was collected during June and July 2012 by means of a self-administered survey. Customers were approached by the researcher/s after dining at either restaurant X, Y or Z. and after they had paid their bills.

SAMPLE USED
Since it is easier to study a representative sample of a population, rather than an entire population, a sample was used. Sampling was thus used to select a group with the view to determine the characteristics of a large group (the population). The sample should display the same characteristics as the population. Stoker’s sample size (1985) as quoted in De Vos et al (2002), suggests that from a population of 1000, 14% should be used thus comprising 140 respondents. The researcher opted to use 200 respondents as an appropriate sample size. The target sample for the proposed study consisted of adult diners (>18 years of age) at three restaurant, X, Y and Z, in a casino complex in Gauteng province, South Africa. The units of analysis were thus the individual adult diners to the restaurants in question and they were a segment of the population that is representative of the entire population (Chase, 1967). The respondents were stratified according to age and randomly selected on the basis of convenience sampling (accidental sampling). Random selection means selecting a sample in such a way that each member of the population has an equal chance to be selected. In a random sample then, the researcher assumes that the characteristics of the sample approximate those of the general population. This approach takes people or other units that are readily available, such as those that arrive on the scene by simple happenstance. It contributes towards validity and reliability and to a large degree eliminates biases. Customers who were previously allowed to express an opinion were eliminated from the study on subsequent arrivals at the restaurants in question.

This method was used as it is similar to that used by Mukherjee and Nath (2005) for similar studies on service quality. This study aimed to achieve a minimum sample size of 200 respondents. The realised sample size of the study amounted to 212 questionnaires, with a favourable response rate of 94.33%. A total of 200 questionnaires were analysed. The survey was distributed using a person-to-person method to individual restaurant customers as they left either restaurant X, Y or Z. They were given the survey on a hard board with a pen attached and a gift pack comprising of a box of Belgian chocolates. The researcher provided guidelines and instructions on how to respond to the survey questions. Data
was gathered over a nine day period and 212 surveys were completed of which 200 were used. Unusable surveys were eliminated.

THE SERVICE GAPS

The SERVQUAL of Parasuraman et al (1988), was used to compare customers’ expectations with their experiences so as to demonstrate where service delivery has either strengths or weaknesses. As in most Gaps Theory research, the clearest gap, Gap 1, was the one between customers’ expectations of service provision and their perceptions of the service provision that they actually received in the restaurants. This was the most critical gap that required study by making using of a three-column SERVQUAL. Gap 2 was the discrepancy between management assumptions that customers require fast service and service delivery. Gap 3 was the discrepancy between management targets of food been delivered within ten minutes of an order being placed and actual service provision. Gap 4 related to the discrepancy between the service quality provision as evaluated by customers’ attitudes on the service attributes amongst each of the three restaurants. Gap 5 related to general perceptions of poor service quality provision.

It is important to bear in mind that service quality provision is by its very nature a highly subjective concept and with this in mind, what the customers’ think about service quality provision is essential to success for any food and beverage operation. Customer satisfaction clearly results from a service
encounter and by assessing if expectations are met when compared to actual performance in a restaurant. The service quality would relate to how a customer feels about a restaurant’s excellent service provision or otherwise. Value would relate to how a customer relates the quality of a dining experience with the price paid and if it was ‘good value for money’ or if there is some psychological benefit such as relaxation away from an otherwise humdrum daily routine.

THE SURVEY TOOL

Voluntary Survey: RESTAURANT X Y Z (circle establishment- researcher will assist.
Respondent number: ___________ (number provided by researcher/s)

Dear patron

In an effort to improve service quality levels in restaurants in general, kindly complete the survey as accurately and honestly as possible. Thank you for your willingness to assist in this research initiative. The purpose of the survey is to determine the levels of service quality provision in each of three restaurants and some aspects are related to tipping of waitrons. The survey should take about seven minutes to finish. You will remain anonymous throughout this highly confidential survey. Answers provided will be utilised only for research on service quality provision. Answers cannot be right or wrong. Answer by inserting a cross (X) in the relevant block.

Please indicate your age:

|----------|---------|---------|---------|---------|---------|

Your gender (place an X on your selection) | Male | Female |

Your race | Black | White | Coloured | Indian |

Question 1.

Kindly consider each statement below carefully and indicate the extent to which you
agree or disagree with each one. (Please mark with an (X) 1 for “strongly agree”, 5 for “strongly disagree” or select an option in-between).

Question 5.

5.1 What was the total bill? R ________________

5.2. How much did you tip the waitron? R ________________

5.3 I will / will not recommend this establishment (delete whichever does not apply)

Part 2 of the Survey evaluates SERVQUAL attributes as well as tip size in Tables 1 and 2 respectively. At the end of the survey, customers could make general comments on any aspect.

EVALUATION OF THE 5 SERVQUAL (GAP) DIMENSIONS FOR THE RESPECTIVE RESTAURANTS.

In this part of the survey, there were two questions. Customers were required to give a score on a scale (1 to 10) on their expectation from the restaurant about each attribute so as to gauge their reflection on the service quality provision experienced by them. Question two (Table 1) was designed to measure the importance of the five attributes for multi-attribute attitude measurement. An aggregated scale measurement, which is considered to be valid, was used to measure the reliability of the methods of data collection. Respondents were requested to rate the five attributes based on their perceived importance. Table 2 measured tipping of waitrons.

<td>4.21</td>
</tr>
</tbody>
</table>

“Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. The lower the mean score for an item, the stronger customers’ agreement with that item. The items in the scale were all reverse scored and thus the lower the mean score for an item, the lower the customer’s level of agreement with the item. Since the items all tend to fall between 4 and 5, this indicates that the customers’ have a strong level of agreement with the items in the scale. Where there is a minor standard deviation (relative to that of other items) this indicates that customers tended to
answer the item in a similar fashion. All the items have relatively low standard deviations which mean that all the customers tended to concur in their responses to the questions posed.

An answer of “Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. It is evident that where there is a lower mean score for an item, the stronger the customer’s ranking of agreement with that item. Where there is a large standard deviation this indicates that customers tended to answer the item in somewhat of a unique way. However, all of the items have relatively high standard deviations, which indicate that customers were inclined to be at variance in their answers to the question posed.

A response of “Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. It is apparent that the lower the mean score for an item, the stronger the customers’ levels of agreement with that particular item. Where there is a minor standard deviation (relative to that of other items) this indicates that customers tended to answer the particular question in about the same way. These items have relatively low standard deviations and this means that customers tended to agree in their responses to the question posed. All of the 200 customers answered the payment mode- question 4. Of these, 165 or 82.5% paid by means of credit card. 21 or 10.5% paid by debit card. 5 or 2.5% paid cash and 9 or 4.5% paid by other such as cheque.

Some studies on tipping in the United States have examined the possibility that race differences in tipping vary with the race of the waitron (Lynn, et. al. 2006; Willis, 2003). In each of these studies, the interaction between customer and waitron race was not significant. In this study tipping by race, produced an interesting finding. Blacks left smaller average restaurant tips than Whites, suggesting...
that Blacks tip less than Whites do even when provided comparable levels of service. It did not make a difference that the waitron was black. It appears that Blacks do not know that it is customary to tip 10 percent of the bill size in South African restaurants.

A five point Likert scale was used to measure the customers’ tipping behaviour at the restaurants. This measure included 14 Likert scale statements of which the scale points were labelled: 1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree. The Cronbach alpha coefficient for the 14 items was 0.84 indicating internal consistency reliability. In restaurant X, in which tip size was assessed, the results indicate that the smallest bill size that customers received was R18.50 and the largest bill size was R2656.00. The average bill size of each of the three establishments is R259.70 and the bill size variable has a standard deviation of 87.44. The total number of bills processed was 201 and the average tip size for credit card transactions was R20.00. Cash tips were pocketed directly by the waitrons and there is no record for such. Minimum tip size was R2.50 and maximum was R35.00. The standard deviation was 4.77 and the mean was R15.89. Over a three and a half week period (01 April 2012 to 25 April 2012) at restaurant X, the employee tip report indicates that a directly tipped total of R27327.64 was gained by a total of 12 waitrons. This gives an average tip gain over the period for each waitron of R2277.30. By category of sales at each of the three restaurants, the largest tips were obtained at dinner times, followed by lunch and then breakfast. The highest tip amounts were for tables of more than four guests and the least at tables with only one guest. Virtually all of the waitrons were black employees and 70% of these were women. The largest tips were paid to men.

A multiple item rating scale was utilised to assess various determinants of service quality provision the restaurants X, Y and Z. This encompassed ten Likert scale items. The scale points were categorized as follows: 1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree. The Cronbach alpha coefficient for the ten items was 0.87, which indicates that there is acceptable internal consistency reliability. Higher overall scores indicated a higher level of service quality provision experienced by customers.

FINDINGS

The most stated gaps in the study related to “waitron responsiveness”, “inadequate assurance” and “clean ablution facilities”. In each case customers felt more quality was required. The key demographic profile of the survey respondents was males who especially like to visit Restaurant X. Most customers are between 36 to 45 years of age (21%). While customers between 56 and 65 years of age (11.5% - all in that age category), patronised Restaurant X. It was clear from the research that the desired satisfaction levels of expected service provision the customers’ hoped to receive, was predominantly from Restaurant X. The least acceptable establishment was Restaurant Y. The score for
the multi-attribute attitude measurement was calculated by making use of a modified equation as per Solomon (2002): Where, A is the overall attitude toward the restaurant, B the strength of the belief that the restaurant has any type of attribute (i), (i) the SERVQUAL attribute of a restaurant, (j) the restaurant, (k) the customers of a restaurant, (l) the customer evaluation of the strength or weakness of the attribute (i), (n) indicates the total number of customers. In making use of this equation, a customer’s attitude towards a restaurant’s service quality provision was measured based on the total of the products obtained by multiplying the mean values of each of the SERVQUAL attributes and their respective mean value of importance.

Restaurant X had the highest total mean attitude (8.94) and Restaurant Z (7.96), while Restaurant Y had the lowest total mean attitude (7.66). The variance between each of these three restaurants is thus small. The findings do however suggest that customers of Restaurant X expect a certain kind of service given that it is part of a restaurant franchise brand. Not surprisingly then, it achieved the highest Assurance attribute rating. In some cases, service failure on the part of a waitron or kitchen staff, was exacerbated by poor floor management techniques where managers failed to effectively deal with failures and where public arguments with customers were almost a norm. Restaurant X, as the most popular restaurant of the three investigated should reassess the attributes of Empathy and Tangibles for improvement if it is desirous of obtaining a greater market share. The research is clear that Restaurant X generally provides quality service to its customers. There are however concerns with ablution facilities that are not as clean as patrons would like them to be. The same applied to Restaurants Y and Z. Service was generally in line with what customers’ expected but portions were not considered to be value for money in either of the restaurants. There was also an observation that meals were not balanced nutritionally and that vegetables, for example, had to be paid as an extra item in some cases. Customers felt this was not acceptable.

Service performance levels as perceived by customers were generally above the “minimum service level,” but where however below the level of service that customers desire. The least problematic area for Restaurant X, was between perceived and desired service delivery presented for the attribute Responsiveness. This indicated that the restaurant’s service is comparatively good. The Tangibles attribute was also fairly good. For restaurants Y and Z, service delivery was considered to be poor and prices were “unrealistic”. The fastest service was at Restaurant Z, but that also had the least customers. The dirtiest ablution facility was at Restaurant Y. Waitrons in this restaurant were also sloppily dressed and the least empathetic The training of waitrons was considered to be in need of improvement although it was acceptable, perhaps indicating a complacency amongst the South African consumer. Noise levels were the highest at Restaurant X, which is not surprising given that it
had the most customers overall. The seating and ambience in all three restaurants was acceptable but could be improved. Dining areas were all ‘fairly clean’, but the method of cleaning tables after others had just eaten at a table was considered ‘laughable’. Menu items were acceptable, but prices were considered to high for certain items. The Assurance and Reliability attributes were consistent in Restaurant X—although some customers disagreed. It was mentioned in one customer comment that the floor manager of Restaurant Z was a ‘pig’. After a complaint was made about cold food, he told the customers they were welcome to go elsewhere if they were not happy. Any customer service failure such as this, especially the information provided by the customer at the time that the complaint is lodged, should be viewed as a critical marketing research data, which is necessary not only for immediate service recovery but for the improvement of future performance which will hopefully lead to customer loyalty. Seventeen of the customers surveyed commented that they found prices to be higher than what they recalled from previous visits to each of the three restaurants. Restaurant customers typically store prices of meals in their memories (Grewal et al., 1998). Consequently, if the prices on a menu are higher than what the customer expects to pay, customer satisfaction will be negatively affected. It is thus important, for restaurants to have competitive menu prices for the market segment in which they seek to position their offerings.

Parking of vehicles was not problematic and customers felt safe in the casino complex, given that the area is boomed and that there is a visible security personnel presence. The evidence suggests that there is room for improvement in all three restaurants, especially Y and Z. especially tangibles need improvement. Better waitron training could also to a large degree result in better service quality provision in all three restaurants. The poorest floor management was in Restaurants Y where the person ‘irritated’ customers by constantly asking if everything was alright. Waiters should be certain and concise when taking orders, and meals and drinks must be delivered to diners within a reasonable time, ideally within 15 minutes. This requires effective training. It is also clear that South African customers who opt to pay using a credit or debit card tend to leave larger tips than those paying with cash. Previous studies have demonstrated that regular customers tend to leave larger tips than new customers (Azar, 2007) and this was found to be the case in this research. The researcher was able to evaluate the service quality provision, and gained greater understanding of the customers’ satisfaction levels as well as attitudes toward SERVQUAL’s service attributes. It was discovered that there is indeed a large variance in service quality provision, which manifested itself in the tipping of waitrons. Based on comments obtained in the survey, it is apparent that waitrons who serve customers well develop a relationship with them that promotes service quality provision. This concurs with Fernandez (2004) who states that personal connections are what drive excellent service quality. From comments made, it is also clear that tip size provided by a customer at a restaurant is
not only affected by the quality of service they receive, but also by the economic state of the country. However, despite economic downturns, prompt and good quality service, is likely to result in bigger tips for waitrons' and in return patronage, but black customers must be educated about the customary 10% tip in South Africa. If we rank the restaurants in terms of the findings, Restaurant X would in ‘gold medal’ position, Restaurant Z would obtain ‘silver’ and Restaurant Y would obtain ‘bronze’. The findings of this research provide useful suggestions to the restaurants in question for taking any necessary corrective actions to improve their service quality provision but there were some limitations.

STUDY LIMITATIONS

SERVQUAL is a simple and useful model for qualitatively exploring and assessing customers' service experiences. It is widely used by service delivery organizations and is considered to be an efficient model in helping a business to intensify its efforts in However SERVQUAL’s five dimensions are not universals, and do not draw on established economic, statistical and psychological theories. Service quality provision is also linked to employee satisfaction, which was not investigated in this study. SERVQUAL does to an extent illustrate the core of what service quality provision may mean including price, but it may also include other psychological and economic benefits. The intangibility, heterogeneity and inseparability of services create problems for managers and employees and thus also for customers.

The results of the study are based on a relatively small sample size which has been chosen from a small geographic during a short time period. Although the sample is reliable, it would be more accurate to expand this research throughout the province of Gauteng. There may well be other relevant restaurant service quality provision attributes that could influence customers’ expectations and perceptions about their overall dining experience that are not included in this study.

The sample size of n=200 was acceptable, but a bigger sample would have allowed for more authoritative analyses and findings. There could also have been more restaurants evaluated and ideally three from the same brand of franchise as Restaurant X. More efficient scales could be developed where individual items can be grouped together to reflect the construct which is to be measured. The nature of the environment was problematic as respondents were approach after leaving a restaurant where they had dined and were initially distrustful. There was also, in some cases extremity bias, where diners responded to questions by ticking the same number in a Likert scale, for all the items in a scale.
CONCLUSION

The results of the gap analysis make it clear that the restaurant service providers did not meet customers’ expectations. The indication is that overall restaurant service quality fell below the customers’ expectations and that satisfaction was not as high as it should have been. There is thus room for service quality provision improvement in each of the restaurants. The three restaurants in this study could improve service quality provision through especially the dimensions of responsiveness, reliability and assurance. While how a waitron behaves may not directly influence customer satisfaction with a meal, it may have an indirect effect on customer satisfaction via quality service provision.

In terms of the findings of this study, three of the biggest gaps related to “waitron responsiveness”, “inadequate assurance” and “clean ablution facilities”, meaning that customers’ expected much more responsive waitrons, greater assurance that quality of service and food would be good, and cleaner rest rooms than was actually experienced. All of the attributes in Table 3, with the widest statistically significant gaps represent severe deficits and require the significant attention of restaurant managers and staff in terms of making required improvements. The findings indicate that most of the customers’ expectations concerning restaurant quality service provision are best explained by the subsequent factors, namely, appearance and ambience of facilities, a feeling of assurance, personalized service, satisfaction, responsiveness and reliability of waitrons. The latter determined the tip size they obtained to a large extent. The results thus strongly suggest that restaurant managers must train staff effectively and make certain that they provide timely service. The competence and efficiency of staff is critical to success. This will mean that there is accurate billing and service that is free of errors, leading to enhanced levels of customer satisfaction.

The critical strategy to retain customers is to improve service recovery quality, and by having a quick response to service failure. Consequently restaurant managers must immediately begin to focus attention on ensuring that future service delivery levels are high and seek to enhance the strength of customer relationships with each of the complaining customers. Managers should thus be attentive to recovery service quality as much as they are to service quality provision and should therefore enhance complaint management by having suggestion boxes at the front-desk or present customers with survey material to assess quality matters. Managers should formulate a competitive strategy based on a modified model of service quality provision to keep loyal customers and to enhance customer relationship management. Customer satisfaction undoubtedly has a major and direct effect on customers’ behavioural intentions. Despite its shortfalls and limitations, this study implies some new contributions. The findings contribute to the development of a service quality provision excellence approach that will help to identify customers’ expectations and hopefully encourage staff performance.
improvement in the three restaurants studied. The results may thus expand knowledge of restaurant service quality provision that could drastically improve business for the restaurants involved as well as restaurants in general.

ABSTRACT

The present paper discusses some of the findings of an ongoing “Green & Smart Furniture” (GSF) research project. It actually focuses on third-age consumers’ behavior and interest in purchasing smart and eco-friendly wooden furniture. The research reveals the critical elements for a successful design and production of GSF products that will enhance both needs and expectations of the consumers. Thus, 399 specially constructed questionnaires were gathered during 2013, which were further elaborated and statistically analyzed with SPSS ver 17.0.

Results are quite encouraging for the enterprises that would decide to design and produce smart and eco-friendly wooden products. Consumers show a significant interest in purchasing GSF at a percentage of 70%. They are willing to pay an extra amount of 9% in average than regular prices of conventional furniture. The most important factors in purchasing GSF have been found to be price, quality, functionality, safety and ergonomics, as well as the type of raw materials.

Keywords: Green Wooden Furniture, Smart Furniture, GSF, Market research, Consumers’ Behaviour, Third age, Greece, sustainability

1. INTRODUCTION

European Union, is one of the biggest manufacturers, traders and consumers of wooden product in the world (European Commission, 2013). Furthermore, the sector of furniture manufacturing in the E.U. has a strong presence internationally, mainly because of the high quality standards in technical and aesthetical level (UEA, 2005). During the period 2000-2007, furniture industry has known significant growth because of a sum of specific conditions. Nevertheless, there is in general a growing concern related to the environmental consequences that occur by the production, use and disposal of goods during the end of their life (Humphrey and Schmitz, 2001).
The knowledge on environmental consequences of the materials that are been frequently used in a particular industrial sector, constitutes enterprises capable to improve their products and their production processes by an environmental point of view and thus to accelerate their entrance to the emerging markets of green products (Nedermark, 1998).

Many furniture manufacturers at a global level, understand the responsibility they have in making environmental friendly furniture, since green products in general that are gradually been introduced in markets, force the designers of products to include environmental criteria in the production processes and in final products (Maxwell and van der Vorst, 2003; Shapiro and White, 1999) and thus the number of such enterprises is growing constantly (Frondel et al., 2007; Epstein and Roy, 2006).

Regarding Greek furniture sector, a related study of Papadopoulos et al., (2010) has shown that the majority of the Greek furniture enterprises are strongly support green entrepreneurship and certification of wood regarding its environmental impacts. Through this process, the firms believe that they will be able to develop new fields of entrepreneurial activity, based to certified ecological furniture products, enhancing their competitiveness and innovative activity (Trigkas et al., 2011).

2. LITERATURE REVIEW

2.1 Green wooden products

Eco-furniture or “green” furniture, is defined as a product of furniture designed to minimize the environmental impact during its whole life-cycle (Albino et al., 2009; Baumann et al., 2002) and thus furniture with characteristics of environmental compatibility, taking into consideration all the stages in furniture life-cycle (Alhola, 2008; Progetto Life, 2005).

Several research initiatives have been launched during the last years regarding furniture design and production that are environmental friendly. The ‘Life Environmental Ecofriendly furniture project’ has been launched in Italy during 2001 aiming in developing furniture prototypes with elements compatible to environmental protection, taking under consideration all the stages of a furniture life cycle (Progetto Life, 2005).

A very interesting initiative was also the Finnish Furniture Panel launched in 2004 focusing to environmental impacts of furniture during their life cycle, further aiming in finding solutions regarding the development of the sustainable growth of the furniture industry in the country (Finnish Furniture Panel, 2005; Nissinen and Parikka, 2007). Additionally, several web sites were developed, containing all the related information regarding issues concerning ecological furniture, for manufacturers as long for the consumers (Ecosmes, 2005; Nordic Ecolabelling, 2003; GRIP, 1998).

2.2 Smart furniture
Furniture constitutes part of our everyday living environment especially inside buildings, through which the user comes to a direct interactive contact in executing several activities. Studying daily routine and needs of a person through its interaction with furniture and utilizing technology, it is possible to develop new uses for furniture that will contribute to the improvement of quality of life.

Smart furniture constitutes the future evolution and tendency in furniture industry (Tokuda et al., 2003; Zongdeng and Wenjin, 2010). Thus, a smart furniture product has the capability to alter a conventional space into an intelligent spot that includes computing systems (Ito et al., 2003). Since a smart furniture is equipped with computing networks, sensors (Mavrommati et al., 2003) and several information technology devices, it could offer many different services, either by itself or in cooperation with other devices and items of the everyday human environment under the context of a Ubiquitous Computing (UmpiComp) environment (Wuliji, 2009). UmpiComp environments, regard the method in including and using computing systems in a way that constitutes them available to our everyday living environment, making them simultaneously "invisible" to the user (Weiser, 1993).

In a related study (Karvelas, 2007), some of the research projects in the field are presented, regarding smart furniture in networking to ubiquitous computing systems and environments.

Indicatively we refer the construction of a smart table which can recognize what and how much we are eating and which has been developed by a research team of the National University of Taiwan. The Dietary-Aware Dining Table using sensors for measuring the wage of objects and RFID technology in identifying objects, could know the amount and the type of food that has been consumed by the users during one meal (Chang et al., 2006).

Another example has to do with the Drift Table and the Key Table which were developed under the context of the project for residential technologies of Equator IRC, as smart furniture embedding functions such as, slow moving presentations of aerial photos, which their speed, direction and height are defined by the disposal of objects on its surface and their wage, or such as in understanding the mood of the user by the force that he put objects on the surface, using wage sensors (Gaver et al., 2004; Boucher et al., 2006).

The E.U. is also giving special attention in the development of smart furniture for the third age through the funding of the WIDER project (2014), in order to give the opportunity to furniture industries across Europe to innovate and differentiate from the competition and to produce this kind of products.

2.3 Target group for Eco and Smart furniture

The U.S. Congress spends approximately $1.5 trillion for health care services on a yearly basis, while the forthcoming years the population of the third age is expected to become bigger than the younger
The percentage of the U.S. population that is expected to be over 65 years old, shows constantly a growing tendency and it is foreseen to reach the 18.2% of the country’s total population in 2025, with this tendency to be global (Dishman, 2004).

Furthermore, the improvement of living and the evolutions in the medicine science have contributed to the increment of the expected living, since during the second half of the 20th century expected living has been increased by 30-40 years (Huth, 1986, Pennathur et al., 2003). According to the forthcoming evolutions in medicine science and biochemist, the expected living is foreseen to be further increased for 20-30 years during the next generation (Pennathur et al., 2003).

Ageing in the third age is manifested usually through the reduction of stamina, ware down of bones and muscles atrophy, slowing down of senses and spiritual capabilities, loss of balance and slowing down of person’s activity and mobility (Pheasant, 1986 in Comfurt, 2003a; Burke, 1990).

Many research efforts has been made internationally during the last years regarding the design and development of products that would make easier the way of living of the aged people improving their surrounding space, especially in residencies, aiming to the confrontation or to the tempering of the negative consequences of ageing (Anderson, 1975; Demirbilek, 1999; Haigh, 1993; Naqvi et al., 1994; Pinto et al., 2000; Comfurt, 2003a; Jönsson, 2003; Pennathur et al., 2003; Nikopoulos, 2010).

Thus the target group for “smart and eco furniture” under the context of the present research, has to do with the third age to which the research could offer many solutions in improving their everyday living, through becoming more independent, reduction of health care costs, improvement of their quality of life, securing spare time for persons that are involved to their treatment, improvement of their capabilities and cure until a level through everyday treatment. Regarding furniture enterprises, such an effort could have economic benefits in case of their mass production.

The aim of the present research under the context of the project GSF – Green and Smart (Eco-logical) Furniture, was to register the opinions and the correspondence of furniture consumers of the third age regarding smart and sheer ecological furniture, having as a main scope the introduction of the criteria according to which the first furniture with the above mentioned elements, will be designed at a European level.

3. RESEARCH METHOD

A research instrument was developed to serve as the basis for collecting data pertaining to the study’s parameters. All questionnaire items were constructed using self-tying 5-point Likert scales. Furthermore a number of questions would be of multiple-choice type. Both are well-accepted practices in this type of research. It should be noted that most questions reflect perceptions of the interviewed sample in order to outline the trends regarding GSF for the specific target group.
The items pertaining to each scale were pre-tested with 5 face-to-face interviews. The pre-testing process allowed the researchers to assess the content validity of items and ensure that interviewees understood the research instrument as they were intended.

The questionnaire included 4 different groups of interest and a total of 23 questions. The first group of questions regarded the general characteristics of furniture products that are currently used by the consumers. The second group included 9 questions related to the awareness of the consumers regarding the meaning of ecology and the inclusion of technology in furniture products specifically, but also into their everyday living in general. The third group constitutes of questions related to the type, specific characteristics and elements of smart and ecological furniture which could be developed as long the amount that the consumers are willing to pay extra in acquiring such a product. Finally, the fourth group was formed by questions regarding the profile of the consumers that have participated in the research in order to highlight the specific characteristics of the potential consumers of smart and ecological furniture.

The research was addressed to a random sample of 399 consumers from different regions of the country during 2013. Questions were selected in such a way in order to be short and comprehensive for the best possible convenience of the participants.

Before the launch of the study, a content validity test was conducted regarding the questionnaire. This test was based on discussions with furniture enterprises and specialized scientists in the furniture field along with the extended literature reviewing. Following this, a pilot questionnaire was tested to 10 consumers. The pre-sampling results indicated the points that needed to be further clarified improving the quality of the questionnaire (Dillman, 2000).

The construct validity was based on the test of unidimensionality of the elements constituting each factor, as well as the content validity of each factor separately. We used Factor analysis according to the method of Principal Component Analysis. Regarding the content validity of the research variables, the statistical factor of Cronbach’s Alpha was used (Siomkos and Vasilikopoulou, 2005; Chantzoudis et al., 2009; Sarigiannidis et al., 2009).

Data were processed and analyzed using the statistic package SPSSWIN ver 17.0 and all the related tests of Frequencies, Descriptives, Crosstabs, Correlation analysis and Cluster analysis were made (Norusis, 2007; Howitt and Cramer, 2003), in order to highlight the specific characteristics of the potential consumers of smart and ecological furniture and the range of integration regarding attributes – functions of the furniture products.

4. RESULTS
The sample consists mainly of people between 61 - 75 years old, of low and average annual family income ranging from 5,000€ to 20,000€. Furthermore, the majority states that they live in towns in detached residences with a surface from 50 to 100 square meters, while the 24,0% of them owns bigger spaces (101 - 120 square meters). The majority live with husbands/wives or the rest of the family. The analysis of the first group of the research’s questions delineated the contemporary use of furniture in residences and their specific characteristics regarding people of the third age. Spending most time, in their living room (at a percentage of 40,4%) and kitchen (at a percentage of 32,6%) the target group places great importance on chairs (27,9%) and tables. Wooden furniture comes also first to the participating consumers’ favor regarding everyday use.

A 54,4% of the target-group consumers admit that they are not willing to replace conventional furniture with green and smart ones unless it is cheaper (Figure 1). This finding is quite normal considering the squeezed income in the current difficult economic climate in Greece during the last 4 years. However, there are also three more criteria that seem to have a significant role in purchasing GSF: a) health condition (50,4%), b) assistance of GSF to everyday living (49,4%) and c) environmental protection along with the improvement of their everyday living conditions (49,1%). The last criterion confirms further previous relative researches (Papadopoulos et al., 2010; Trigkas et al., 2011) regarding the role of environmental protection in developing new target groups and markets for the furniture and wood sectors in Greece and in general, as well as for the development of new entrepreneurial opportunities under the context of green entrepreneurship. The awareness of contemporary consumers of environmental issues indicates that the area of green furniture should be an alternative aspect under consideration by furniture enterprises when forming their competitive strategies.

Figure 1. Criteria for changing conventional furniture with smart and ecological ones

The analysis of the answers to the third-group questions indicated characteristics and properties desired by GSF in regard to:

- environmental and natural resources protection,
- technology and its applications
• the specific needs and demands of end users and their surrounding space.

Therefore, the most important criteria using a 5-Linkert scale (with 1 as very much) appear to be:

a) sustainability regarding natural resources’ use (ranking 1.72),
b) production processes that respects the environment (1.74),
c) energy saving during production and use (1.79) and
d) to be manufactured by recyclable materials (1.82).

Attributes such as ergonomics, safety, use of ecological finishing materials, the ability of reusing the components in the end of life-cycle and the use of innovative materials, follow at a lower significance ranking.

It should mentioned that these findings coincide with EU policies on furniture’s value chain, which set among major priorities the production and use of products that minimize their environmental footprint, in the context of efficient use of resources and sustainability. Forest products should follow the Cascade principle according to the European Commission (2013), and thus present a life cycle of:

a) production, b) reuse, c) recycle, d) bioenergy production and e) eco-disposal of wooden products.

Table 1. Criteria that ecological furniture should meet (ranking 1 till 5, with 1=very much and 5=not at all)

The familiarity of third-age consumers with technology was further explored as well as the range of inclusion of computing systems into several technological applications and functions. 36.3% of the respondents consider the use of technology as a good idea while the 31.6% consider it as quite necessary and a 25% stated that technology helps a lot their everyday living. These consumers seem to have bigger familiarity with technology mainly regarding applications such as the use of mobile phones (2.54), home automations like automatic wind screens and lightning (3.39), use of audiovisual...
means such as TV, DVD, projectors. (3.43), and IT and internet at a ranking of 3.79 and 4.00 respectively.

Focusing more on the specific characteristics and properties of smart furniture, the analysis of the results has revealed that the anthropocentric design constitutes the basic property of the furniture product with technological characteristics to follow. Such attributes could be the capability of warning for health problems of the person at home or the capability to communicate with the user and interact with its environment.

These findings could be further correlated with the results of Table 2, regarding the aims that smart furniture should achieve. Thus, at a declining significance ranking, the participants consider that smart furniture should facilitate user’s everyday living > execute some routine activities > secure an independent everyday living of the person > generate a pleasant environment inside the house.

Aims regarding the health of the user, such as the function of becoming a warning device in health and safety issues and the monitoring of the person’s health in general follow with a ranking of 2.03. Chi square test has shown that a statistical significant correlation exists between groups of ages and a) the property of facilitating the communication with other people outside the house (Pearson Χ² = 33.53, for a significance level >99.9% Approx. Sig= 0.001) and b) monitoring of person’s health (Pearson Χ² = 32.51, for a significance level >99.5% Approx. Sig= 0.005). Hence, the older the person, the bigger becomes the need of communication with other people and the monitoring of their health.

Table 2. Properties and characteristics of smart furniture (ranking 1 till 5, with 1=very much and 5=not at all)

Thus, anthropocentric design is significant for smart furniture with the potential to facilitate user’s everyday routines in a pleasant environment inside the house with parallel simple and easy-to-use technological support in health issues such as monitoring and warning.

Finally, the three most important factors that influence the participants’ decision in purchasing GSF appear to be price, quality and functionality of the furniture as presented in Table 3. The rest of the factors follow, such as safety and ergonomics, environmental protection, technology and the design.
### Table 3. Factors and range of influence in purchasing smart and ecological furniture (ranking 1 till 5, with 1=very much and 5=not at all)

<td>2.40</td>
<td>1.326</td>
</tr>
</tbody>
</table>

The above mentioned factors of Table 3 are correlating each other and the correlation analysis using the Pearson correlation coefficient (Pcc) indicates that at a significance level of 0.01 the factors that affect positively each other in order for a consumer to buy GSF are the following:

- Quality in relation to a) raw materials used for manufacturing (Pcc = 0.606), b) functionality (Pcc = 0.469), c) ergonomics and safety (Pcc=0.412).
- Price in relation to a) quality (Pcc = 0.365) and b) functionality (Pcc = 0.229).
- Functionality in relation to a) safety and ergonomics (Pcc = 0.626) and b) raw materials used in manufacturing (Pcc = 0.560).
- Design in relation to a) technology (Pcc = 0.624) and b) ergonomics and safety (Pcc = 0.455).

Based on these findings, it is speculated that the added value for the GSF consumer is significantly related to economic factors, which is quite expected within the context of the severe Greek economic crisis. Qualitative characteristics and facilitation of everyday routine of users follow indicating that the main criteria regarding the decision of purchasing GSF are not substantially different of those for the conventional furniture. Nevertheless, firms will have to detect these specific elements that will allow them to achieve differentiation during production, including the incorporation of sophisticated technology and environmental protection in their products.

Following the above mentioned findings and according to Table 4, it is observed that the consumers’ preferences, regarding the functions that a smart furniture could have, are mainly oriented towards: a) the convenience in maintenance and cleaning (1.64), b) convenience in movement (1.67), c) safety (1.71) and d) support of persons for changing spots of the furniture or adjustment of its dimensions according to their anthropometric characteristics.
The functions of smart furniture should secure convenience and adjustments to individual anthropometrics and kinesiology according to age and safety. The average consumer of the third age, according to the research, thinks of multifunctional furniture, which will furthermore contribute towards the reduction of everyday living cost through the satisfaction of a wider range of needs.

Of significant importance are also the findings presented in Figure 2 which concern the extra amount of money that the consumers are willing to pay in order to buy GSF. A rather satisfactory 27.4% states that are willing to pay a 5-10% extra for GSF compared to conventional furniture. Adding the percentage of those who are willing to pay an extra 1-5% (22.4%) and an extra 11-15% (18.6%), a cumulative percentage of 68% of the research sample seems willing to pay till 15% more for GSF in relation to a conventional furniture.

These findings are quite significant, since besides the economic downturn and its dramatic consequences to the family income and the furniture sector in Greece, consumers are willing to pay extra for the added value of a furniture product with technological and ecological innovations to satisfy specific needs. This information is quite valuable for the furniture manufacturing sector; it actually can constitute an important recommendation regarding competitive strategies based on differentiation. Reconsideration of low-cost business strategies towards innovation and differentiation are quite sufficient to secure a significant part of the internal market and furthermore, to boost extroversion within the crisis context (Papadopoulos et al., 2012; Trigkas et al., 2012; Papadopoulos et al., 2010).
Figure 2. *Extra amount of money that consumers are willing to pay for a smart and ecological furniture*

Thus, according to the above mentioned results, it seems that there exists a “critical mass” of consumers of GSF in Greece, which can constitute a significant market for innovative Greek furniture enterprises during the period of the economic recession. Furthermore, the specific type of furniture can also support export activities which are rather rare for the Greek furniture sector.

Using cluster analysis we tried to focus more on the preferences of the target group of potential GSF consumers in relation to their specific characteristics and profile, such as their age and income. Table 5 presents the basic GSF properties and characteristics in relation to the consumers’ age. Thus, it seems that for almost the sum of the age groups, these properties are convenience in maintenance and cleaning and the convenience in moving the furniture, especially for ages over 66 years old, as well as supporting in changing positions when sitting. The capability of warning for health problems seems to play a significant role for ages over 75 years old.

Table 5. Groups of consumers according to age and furniture attributes (ranking 1 till 5, with 1=very much and 5=not at all)

What are the main reasons that our target group would decide to pay an extra amount of money? The research indicated (Table 6) that there are actually different criteria for different ranges of percentages of extra amounts. More precisely, the actual purchase price and the level of quality are the main criteria for people who are willing to pay 1-15% more for GSF. The actual price seems to be the only criterion for paying more than 20% since there is a common perception that GSF will be rather expensive. However, the people who seem willing to pay an extra amount of 1-5% expect also better ergonomics, safety, functionality and assurance that environmental protection has been taken into account during production. On the contrary, the results show the willing to pay of the consumers an extra amount from 16-20% has to do mainly with the design of a GSF.

Table 6. Groups of consumers according to the extra amount they are willing to pay in purchasing a GSF and purchasing criteria (ranking 1 till 5, with 1=very much and 5=not at all)

5. CONCLUSIONS - PROPOSALS

Wooden furniture is still the first preference of the participants of the research, regarding everyday use. Thus, wood could constitute the basis for the construction of a GSF, since it is by its nature an ecological material having the minor environmental footprint in relation to other materials. This property can be even of greater value when wood comes from certified sustainable managed forests and if the wood products bear the relevant labeling at European and international level according to UNECE and FAO (2012).
The criterion of price in relation to the quality plays the most fundamental role in the purchasing decision of GSF and the willingness to change conventional furniture. Modern consumers that belong to the third age seem to have a great awareness regarding environmental issues, a fact that enterprises should take into consideration and include to their planning and strategy.

GSF properties and characteristics of special interest seem to be the promotion of sustainability in natural resources use, the environmentally friendly production process, energy saving during its production and recyclable materials (when other than wood).

Regarding the "smart" - technological characteristics of the GSF, the significant ones are these of the ability to warn for health problems of the person, the ability to communicate with the end users and the ability to interact with its environment, with ergonomic design as a core element. Thus, the participants in the present research consider that "smart" furniture should facilitate their everyday routine and secure independence of the person. Regarding the specific technological applications that could be included to smart furniture, the technology of mobile phones seems to be more familiar to the users with the use of audiovisual means and use of computers and internet to follow.

The main criteria regarding the purchasing decision of GSF do not substantially differentiate in relation to conventional furniture products, a fact that can direct furniture enterprises towards the development of their competitive advantages. Nevertheless, regarding their manufacturing strategy they should detect these elements that differentiate them from competition and allow them to achieve their targets, including sophisticated technology and environmental protection in their products.

The majority of the sample state that are willing to pay an extra amount of 9% in average of the price of a conventional product, while the 2/3 of the consumers could afford a 15% extra amount. This percentage is of great importance if we take under consideration the reduced available income of the consumers because of the economic crisis in Greece during the last 4 years. This percentage is higher than the one found in a relevant study regarding the market of furniture with only ecological characteristics (Papadopoulos et al., 2013). A 10% states that they are not willing to pay extra, a fact that can be explained because of the reasons mentioned above.

These findings are quite encouraging regarding the existence of potential GSF consumers in Greece and indicate that third-age consumers are willing in purchasing GSF that includes sophisticated characteristics and properties focused on their needs which also comply with ecological standards. The capability in warning a familiar person to the GSF user for health problems seems to play a significant role for ages over 75 years old, which are these group of ages that usually need medical care.

The present research is the first in Greece and at European level, according to our knowledge. We could argue that it promotes the development of innovation for furniture manufacturing industries, in
order to approach an extended range of consumers, through the production of GSF. Thus, a new pathway is opening in confronting the difficulties and strong competition that furniture sector faces at national and European level, and recover the crisis (Papadopoulos et al., 2013). Furthermore, findings constitute an optimistic message towards furniture manufacturing sector; firms should redesign their strategy (Papadopoulos et al., 2009), focusing in differentiation by including GSF products in their portfolio, innovating through the production and promotion of furniture products with high added value. This fact could secure a share of the domestic market and boost extroversion, which is of great importance. This optimistic thesis is further certified by the findings of a previous study regarding only ecological furniture (Papadopoulos et al., 2013), where Greek and Cypriot enterprises consider the development of ecological furniture very positively, without mentioning the inclusion of “smart” elements.

Findings also certify the research of Tokuda et al., (2003) and Zongdeng and Wenjin, (2010), that "smart" furniture constitutes the future trend and evolution in the furniture industry.

The present research has certain limitations. Further research could be extended to a bigger sample of consumers in Greece and other countries e.g. Cyprus, Italy, Germany, Spain, France, Russia, Portugal, Israel etc. In this way, we could have a holistic picture of trends and tendencies in these countries too and develop a more concrete portfolio of characteristics and properties of innovative green and smart furniture.

AKNOWLEDGEMENTS

This research has been co-financed by the European Union (European Social Fund - ESF) and Greek national funds through the Operational Program “Education and Lifelong Learning” of the National Strategic Reference Framework (NSRF) - Research Funding Program: ARCHIMEDES III. Investing in knowledge society through the European Social Fund.

COMPETENCE OF BOLLYWOOD CELEBRITIES IN GENERATING BRAND RECALL IN KOLKATA

Patra, Supriyo1; Datta, Saroj Kumar2

1Department of Business Administration, ST. Xavier’s College (Autonomous), Kolkata, India
2School of Business, Galgotias University, India

ABSTRACT

Kolkata is known world over as the “City of Joy” and is also treated as the cultural hub of India. Brands from within the country as well as from abroad are trying to connect with their target audience of Kolkata. Advertisers are making use of both rational and emotional appeals in their advertising campaign in order to position their brands in the mind of the target audience in Kolkata. Celebrity endorsement has become very prominent in mass media and advertisers are signing the Bollywood Celebrities for their brand endorsement purpose with the expectation of creating brand recall and preference among the target audience.

The objective of this paper is aimed at determining the proficiency of selected Bollywood Celebrities in generating Brand Recall among the respondents of different gender and age groups in Kolkata.

Primary research was conducted with cross sectional research design by applying survey method among a randomly selected sample of 400 respondents in Kolkata with a structured questionnaire. Independent sample t-test and ANOVA techniques were used for analyzing the data.

The findings show that all the selected Bollywood celebrities are highly familiar among the respondents. There is no significant difference in their brand recall generation capacity among male and female respondents. However, they are having a significant impact in generating brand recall among the respondents belonging to the age group (18-25) years compared to the others three age groups selected for the study.

Keywords: Bollywood, Brand Recall, Globalization, Kolkata, Celebrity, Media.
INTRODUCTION

Bollywood Celebrities from the Hindi film Industry in Mumbai are having huge fan following in India and are also seen endorsing brands across product categories be it FMCG, Consumer Durables, Service brands and even they are a part of various social awareness campaigns.

As per reports available based on a study conducted by AdEx India a division of TAM Media research, Celebrity Endorsement Advertising volume witnessed a growth by 26% in January - June 2013 in comparison with January - June 2012.

From the same study it is evident that the Hindi Film Stars (HFS), actors and actresses from Bollywood, Mumbai captured 80% of Celebrity Advertising in terms of Advertisement Volume in January - June 2013 followed by Sports Celebrities, Television Actors and Actresses.

One of the major developments in the business world during the decade of the 90’s was the Globalization of markets. The emergence of a largely borderless world has created a new reality for all types of companies. Swiss- based Nestle and Netherlands- based Unilever is among two of world’s largest consumer product companies because they have learned the art of marketing their brands to consumers in countries around the world. Two of the world’s major marketers of cellular telephones are from Scandinavian countries. Nokia is based in Finland and Ericsson is located in Sweden.

In the era of Globalization, multinational corporations trying to connect with the Indian target audience are quick to realize this trend and are hiring famous Bollywood celebrities for their brand endorsement purpose.

A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

Branding in some form or the other has been around for centuries. The initial intention was for craftsmen and others to identify their unique work so that the customers could easily recognize them.

It is worthy to note that marks have been found on early Chinese porcelain, on pottery jars from ancient Greece and Rome and on goods from India dating back to about 1300B.C.

According to (Keller, 2007) Procter and Gamble put the first brand management system in to place, whereby each of their brands had a manager assigned to only that brand who was responsible for its financial success.

According to (Keller, 2007), Branding is treated as a means to distinguish the goods of one producer from those of another. According to the American Marketing Association (AMA) a brand is a “name, term, sign, symbol or design, or a combination of them, intended to identify the goods and services of one seller or group of sellers and to differentiate them from those of competition”.

Celebrity endorsement enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

A study conducted by (Bimal et. al. 2012) reveals that celebrity endorsers are used by the companies for brand equity. It has also showed that consumer think that celebrity endorsed advertisement are reliable and they have the knowledge. They are able to recall the product, the consumers feel associated and it has also helped in influencing the demand of the products.

In the present situation it is extremely relevant to understand the proficiency of the Bollywood celebrities in generating brand recall as huge amount of money is paid to these celebrities as endorsement fees and they are also occupying huge amount of space and time in print and audio visual media as brand endorser.

**Branding challenges and opportunities**

In the words of (Keller, 2007) the reality is that although brands may be as important as ever to consumers, brand management may be more difficult than ever. A number of developments have occurred recently that have complicated marketing practices and made the job of brand manager even challenging,

- Savvy Customers
- Brand Proliferation
- Media fragmentation
- Increased Competition
- Decreasing Brand loyalty
- Learning Advantage
- Consideration Advantage
- Choice Advantages

The recent report about the Best Global Brands of 2013 published by Interbrand shows that Apple has secured the top position followed by Google and others. The list of top 10 best global brands is presented in the figure below.

*Figure-1 Top 10 Global Brands of 2013 (Source: interbrand.com)*

On focusing our attention from the Global context to Indian situation we see that the Most Trusted Brand of 2013 as per a study conducted by economictimes.indiatimes.com in Indian context is Colgate followed by Dettol, Clinic Plus and others.

Between unexpected climbers and widely anticipated slips, India’s largest brands continue to command a lion’s share of the trust of its consumers. The list of top twenty five most trusted brands is presented in the figure below. The figures in brackets represent brand ranks from Most Trusted Brand 2012 study.
In order to cope up with this challenging situation of connecting with the culturally diverse Indian target audience MNC’s and the domestic players are taking the celebrity route to brand building.

Celebrity endorsement in India

In India now it has become a common phenomenon among advertisers and their advertising agencies to use Indian Celebrities for promoting their brands. Celebrities are considered as “any individual who enjoys public recognition and who uses this recognition on behalf of a consumer good by appearing with it in an advertisement” (McC racken, 1989).

This definition of celebrity is considered in this study and it encompasses Movie stars from Bollywood Mumbai. In this study the term “Celebrity” will encompass a variety of endorsements including those in explicit mode “I endorse this product”, the implicit mode “I use this product”, the imperative mode “You should use this product” and the co present mode “the celebrity appears with the product” (McC racken, 1989).

LITERATURE REVIEW

According to (Keller, 2007) Brand Awareness consists of brand recognition and brand recall performance. Brand Recognition relates to consumers’ ability to confirm prior exposure to the brand when given the brand as a cue.

Brand Recall relates to consumers’ ability to retrieve the brand from memory. It requires that the consumers correctly generate the brand from memory when given a relevant cue.

In the words of (Keller, 2007) Brand Awareness also involves linking the brand- the brand name, logo, symbol and so forth- to certain association in memory. Brand Recall can further be classified as unaided recall and aided recall.

According to (Keller, 2007) in unaided recall consumer recall the brand unaidedly where as in aided recall various types of cues are presented to help the consumer recall the brand.

Effect of celebrity endorsement on Brand Awareness-Recall has been an area of research that has been studied by researchers. A celebrity was better than other endorsers in enhancing brand name recall (Friedman and Friedman 1979).
A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

It is also evident from existing literature that a celebrity was better in enhancing brand name recall than a non-celebrity (Petty et. al. 1983). A physically attractive celebrity paired with an attractiveness-related product could enhance brand name recall (Kahle and Homer 1985).

Misra and Beatty (1990) also showed that celebrity/product congruency is better in enhancing brand name recall than an incongruent or irrelevant celebrity.

However different findings emerged from a study conducted by (Costanzo and Goodnight 2005). The results presented in their study, however, found that a celebrity recognized in a magazine advertisement did not increase consumer recall of the brand endorsed by the celebrity for both professional athlete celebrities and other entertainment celebrities who are not professional athletes (Costanzo and Goodnight 2005). The results of their study raise questions relative to using celebrity endorsements to enhance brand recall. Celebrity endorsement enhances self-brand connections when consumers aspire to be like the celebrity, but harms them when consumers do not; this effect is more pronounced when the brand image is congruent with the celebrity’s image (Escalas and Bettman 2009).

Another study conducted on “Effectiveness of Celebrity Advertisements” by (Rajeswari et. al. 2010) highlighted that factors like age, gender, viewers’ status, monthly family income, educational qualification, period of awareness of celebrity advertisements and the type of celebrities (Film stars, Sports stars, Professional models and TV personalities) have close relationship with the level of effectiveness of celebrity advertisements.

However factors like family type and frequency of watching the advertisements have no significant relationship with the level of effectiveness of celebrity advertisements.

Celebrity endorsement enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

From review of existing literature it is seen that contradictory findings emerged regarding the effect of celebrity endorsement on Brand recall. Most of the earlier studies were conducted with students and were experimental in nature. Hence the present study is conducted not just among students but respondents of different gender and age groups in Kolkata.

Research Objectives & Hypothesis

The study is undertaken with the following broad objectives-

➢ First to determine the Brand Recall generation capacity of Bollywood celebrities among male and female respondents in Kolkata.
Second to understand the Brand Recall generation capacity of Bollywood celebrities among respondents of different age groups selected for the study in Kolkata.

Keeping the above objectives in mind the following hypothesis are formulated-

H01: There is no difference in Brand Recall score of Bollywood celebrities among male and female respondents in Kolkata.

H02: There is no difference in Brand Recall Score of Bollywood celebrities among respondents of different age groups in Kolkata.

Research Methodology

In the first part of the study 10 Bollywood Celebrities were selected based on a pilot study conducted among 50 respondents in Kolkata depending on their familiarity and Popularity. Thereafter, the brands endorsed by each of these 10 Indian Celebrities were tracked from advertisements featuring in Television and News papers during the study period as presented in table 1.

Table 1 Brand endorsement details of 10 selected Bollywood celebrities (source the researchers’ survey)

Cross sectional research design was applied for collecting the primary data by survey method from the respondents of Kolkata. A structured questionnaire was administered for collecting the data. The Target population was defined in terms of elements-male and female 18 years to 49 years, sampling unit-household, and extent- city of Kolkata. The Sample Size was arrived at 400 for the study keeping in mind the availability of time, resources, and sample size used in similar studies. The sample size was also selected keeping in mind 95% confidence level and 5% confidence interval.
The first question was asked to ascertain the familiarity of the Bollywood celebrities. The next two questions were asked to find out the Brand Recall score of the Bollywood celebrities. The actual number of correct brands unaidedly recalled against a celebrity is noted for calculating the Unaided Brand Recall score of that celebrity. Similarly the actual number of correct brands aidedly recalled against a celebrity is noted for calculating the Aided Brand Recall score of that celebrity. The Unaided and Aided Brand recall Score of the Bollywood celebrities among male and female respondents are presented in table 2 and table 3 respectively.

Table 5 Aided Brand recall score of Bollywood celebrities among respondents of different age groups (source the researcher’s survey).

RESEARCH FINDINGS

It is clearly evident that all the respondents in Kolkata are having 100% familiarity with the selected Bollywood celebrities. Shah Rukh Khan is having the maximum Brand Recall generation capacity among both male and female respondents followed by Amitabh Bachchan. The list of five top Bollywood celebrities in terms of their Brand Recall generation score is presented below in table 6.

Table 6 Top Five Bollywood celebrities in terms of their Unaided and Aided Brand recall Score among male and female respondents of Kolkata (source the researcher’s survey).

It is interesting to note that regarding the first hypothesis the results of the independent sample t-test for Unaided Brand Recall shows t statistic of 1.436 with 18 degrees of freedom. The corresponding two-tailed p-value is 0.168, which is more than 0.05 and 0.01. Similarly for Aided Brand Recall the t
statistic is 0.499 with 18 degrees of freedom. The corresponding two-tailed p-value is 0.624 which is more than 0.05 and 0.01. Therefore the null hypothesis is accepted at 5% significance level which means the Brand Recall score of Bollywood Celebrities is same among male and female respondents in Kolkata.

<td>17.069</td>
</tr>
</tbody>
</table>

In regard to the second hypothesis, one way between groups ANOVA was conducted. The F value is 67.318 with 3 degrees of freedom for Unaided Brand Recall score and the F value is 12.552 with 3 degrees of freedom for Aided Brand Recall score and both are significant. Multiple comparisons were done and mean difference is significant at 0.05 levels.
Hence the second null hypothesis is rejected and it is evident that the Brand Recall Score of the Bollywood celebrities in the age group (18-25) years is significantly different compared to the other three age groups selected for the study as shown below.

DISCUSSION
Effect of celebrity endorsement on Brand Awareness-Recall has been an area of research that has been studied by researchers. A celebrity was better than other endorsers in enhancing brand name recall (Friedman and Friedman 1979).

It is also evident from existing literature that a celebrity was better in enhancing brand name recall than a non-celebrity (Petty et al. 1983). A physically attractive celebrity paired with an attractiveness-related product could enhance brand name recall (Kahle and Homer 1985).

Celebrity endorsement enhances self-brand connections when consumers aspire to be like the celebrity, but harms them when consumers do not; this effect is more pronounced when the brand image is congruent with the celebrity’s image (Escalas and Bettman 2009).

A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

We have conducted the present study among a wider demographic profile of respondents in Kolkata and it contradicts the findings of the above mentioned study. It is evident from the present study that Brand Recall Score of the male Hindi Film Stars (HFS) is same as the Brand Recall Score of the female Hindi Film Stars (HFS) among both male and female respondents of Kolkata.

Interestingly, different findings emerged from a study conducted by (Costanzo and Goodnight 2005). The results presented in their study, however, found that a celebrity recognized in a magazine advertisement did not increase consumer recall of the brand endorsed by the celebrity for both professional athlete celebrities and other entertainment celebrities who are not professional athletes (Costanzo and Goodnight 2005).

They conducted their study with a convenience sample of business students only but we have conducted the present study with respondents from different demographic profile and not just students in Indian cultural context.

Another study conducted on “Effectiveness of Celebrity Advertisements” by (Rajeswari et al. 2010) highlighted that factors like age, gender, viewers’ status, monthly family income, educational qualification, period of awareness of celebrity advertisements and the type of celebrities (Film stars, Sports stars, Professional models and TV personalities) have close relationship with the level of effectiveness of celebrity advertisements.

The present study is having some resemblance with the above mentioned study and also goes a step further in presenting the fact that there is a substantial variation in Brand Recall Score of Hindi Film Stars (HFS) among the respondents of the four age groups selected for the study. The Brand Recall Score of the Hindi Film Stars (HFS) in the age group (18-25) years is significantly different compared to the other three age groups. It is seen from review of existing literature that Celebrity endorsement
enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

The findings of the present study is not just having resemblance with the earlier study mentioned above but also takes it forward. The results of the present study not just include brands of Durable products but also Fast Moving Consumer Goods and Service brands.

LIMITATIONS & SCOPE FOR FURTHER RESEARCH

Since the study is conducted with just 10 Bollywood celebrities and is restricted to the geographical region of Kolkata it might go down as a limitation of the present piece of work. The phenomenon of brand endorsement by celebrities is a contemporary and challenging area for research. In future building on this piece of research, celebrities from other profession and their role in generating brand recall can be studied in a wider geographic context.

CONCLUSION

In today’s dynamic and cut throat competitive market environment brands are leaving no stone unturned to connect with their target audience. The Bollywood Celebrities are enjoying high familiarity among the respondents in Kolkata and are endorsing multiple brands across different product categories. They are proficient enough in generating brand recall among respondents of both the gender but their brand recall competency is significantly higher among the respondents in the age group between (18-25) years compared to the respondents of the other age groups who are slightly older.

THEORETICAL AND PRACTICAL IMPLICATIONS

On the academic scene although the phenomenon of Celebrity Brand endorsement have been studied from different perspective across the globe, in Indian context and specially in Kolkata the impact of Bollywood celebrities in generating brand recall is not much evident in existing literature. Therefore in this research a modest attempt has been made to understand the brand building process with Bollywood celebrities in Kolkata which is expected to contribute to the existing body of knowledge. This piece of research is expected to provide valuable practical insight to advertisers in taking note of the fact that Bollywood Celebrities are having significant Brand Recall among the respondents belonging to the age group (18-25) years in Kolkata.

INNOVATIVE STARTUPS, THE IMPACT OF FOUNDERS’ CHARACTERISTICS ON THE EARLY STAGE: A CLUSTER ANALYSIS

Pepponi, Federica¹; Pisoni, Alessia²; Onetti, Alberto²

¹CrESIT – Research Centre for Innovation and Life Science Management, University of Insubria, Italy
²Department of Economics, University of Insubria, Italy

ABSTRACT

The paper aims at analyzing the process of startup creation at its very early stage, investigating the connection between the distinctive traits of the entrepreneurs and the arising profiles of the new ventures. In order to do so, we performed a cluster analysis on a sample of Italian innovative startups and their founders. The peculiar features that are statistically significant for the clusterization provide useful information on the initial phases of the innovative venture creation. The results of our exploratory study yield valuable knowledge on the Italian context. Findings suggest that some specific traits of the entrepreneurial profile of the new venture (mainly educational background and previous experience), may have an initial imprinting effect on its firm profile and, hence, its likelihood to grow and to be successful.

Keywords: new venture/startup, entrepreneurial profile, founders, founding team/early founding team/new venture team, fundraising.

INTRODUCTION

The positive impact that new venture creation has on economic growth, innovation and job creation has been proved (Audretsch, 2003). Entrepreneurs are responsible for the economic development through the introduction of innovative ideas, in terms of products, processes, markets and organization. In order to reach this goal an entrepreneur must be able to successfully implement these innovations, which means to satisfy a (new) customer and thus, across job supply, providing economic growth. As stressed by Cuervo, Ribeiro and Roig (2010), the competitiveness of a country’s firms, which determines the creation of its wealth and dynamism, relies fundamentally on the capabilities of its entrepreneurs and managers. As reported by Reynolds (2004), the junction or “choice point” in which an individual decides to get into the startup process is influenced by three groups of variables, those related to individuals, their characteristics and personal background, to their motivations and cognitive features, and finally to the context or environment in which the process takes place. From each of these variables depends the output of the process that is the
possibility that the firm is born, develops and grows, or that it ceases. Therefore, creating a new firm is not so simple. It takes different abilities, knowledge and skills, whose impact on the process may depend on the stage of its development (Klotz et al., 2014). For this reason, and given the relevance of the phenomenon of new venture creation, this paper attempts to shed new light on the role played by the characteristics of the entrepreneur(s) in the very early stage of the above mentioned startup process. Thus, we think that the proposed cluster analysis may help in providing useful information on the process of new ventures creation. The study is focused on a specific national context, Italy.

The paper is structured in 4 sections. Section 1 provides a comprehensively review of the literature on entrepreneurial characteristics affecting the startup process. On the basis of the theoretical framework previously described, section 2 presents the research design and the methodology. Section 3 describes the analytical procedure and cluster profiles. Section 4 discusses findings, provides concluding remarks and future research implications.

**LITERATURE REVIEW: THE ENTREPRENEURIAL PROFILE AND THE STARTUP PROCESS**

In prevailing literature, entrepreneurship is often linked to the discovery and exploitation of profit opportunities (March, 1991). Anyway, as noted by Freeman (1982), firms do not arise spontaneously from opportunities in the absence of human action, but instead are founded through the exploitation of organizational efforts made by individuals. This is consistent with more recent literature on the so called “personality approach/perspective” on opportunity identification, i.e. an individual’s unique personality is assumed as the key driving force for entrepreneurial activity. Many authors distinguish entrepreneurs from other individuals by looking for particular cognitive traits, such as risk propensity, need for achievement and self-confidence (Brockhaus, 1980) in order to detect the individual traits that delineate the successful entrepreneur (Timmons and Spinelli, 1994). In particular, two factors are strongly related to the ability to identify new business opportunities: entrepreneurial alertness, i.e. a unique attitude to sense environmental variations and recognize related opportunities (Kirzner, 1978) and prior knowledge and experience (Shane, 2000). Aldrich and Zimmer (1986) pointed out that a more comprehensive explanation for new firm creation would be that of specifying how individual experience impacts the likelihood that people will found firms. Individual’s prior knowledge and experience could be considered both as arising from work experience (Cooper et al., 1994), as well as from education (Gimeno et al., 1997). An organic attempt to systematize the field of study of entrepreneurship was made by the Entrepreneurship Research Consortium (ERC). The ERC demonstrated that for developing a representative portrait of entrepreneurial activity, individuals should be studied in real time, while involved in the startup process (Gartner et al., 2004). In doing so,
they classified the main variables affecting new venture creation. The first group of variables relates to the individual’s personal characteristics, such as: age, gender, race and ethnicity, region of residence, household structure, personal background (i.e. educational background, work experience and functional expertise). The second group is related to the entrepreneur’s cognitive features, i.e. motivational drivers that lead an individual to choose the entrepreneurial career rather than others. As pointed out by Shaver (1985), reasons for getting into a business (or not) matter, because they are generally considered as the basis of intentions.

Even though prevailing literature on entrepreneurship seems to be concentrated on the role of the individual entrepreneur, today new innovative firms are more likely to be founded by teams rather than individuals (Gartner et al., 1994; Beckman, 2006). To this regard, Cooper and Daily (1997) found that successful high-growth firms are usually built around a team. Further studies reported that team-founded firms have higher success rates, if compared to firms started by single founders (Ensley et al., 2006). In particular, scholars have increasingly recognized the role played by founding teams/early founding teams/new venture teams (NVT) (Ucbasaran et al., 2003; Klotz et al., 2014) in shaping the new venture in its early stages of development and growth. Research on NVTs has focused mainly on the impact that factors such as team members’ basic demographic features, team composition, team members’ networks, have on new venture performance. Insofar, studies on NVTs analyze how experience (education background, specialization and functional experience) of team members positively affect firm performance (Beckman, 2006). Furthermore, the relationship between NVT composition, i.e. heterogeneity vs. homogeneity (educational background, age, diversity of views and skills of each team member), and firm performance despite being in-depth investigated still remains an open/controversial issue (Hmieleski and Ensley, 2007). Social capital and business network are other important NVT input variables. Furthermore, Wright, Hmieleski, Siegel and Ensley (2007) assert that there is a lack of knowledge regarding how individuals and teams impact the effectiveness through which innovative ventures are created and subsequently grown. They also underline the central role played by individuals and teams in the development and growth of technology-based ventures. This is why studying the formation of startup companies means analyzing the characteristics of their founders and how these features affect the output of the entrepreneurial process, i.e. the “initial imprinting effect of NVT” (Klotz et al., 2014).

**Gaps identified and research focus**

There are not many empirical/qualitative updated works related to the analysis on the characteristics of Italian startups and their founders, although this topic is of primary importance to understand the startup process. The novelty of this work is, thus, represented by the exploration of a population on which we have no great prior knowledge, in a significant, yet peculiar, phase of its life. Under this
perspective, our work differentiates itself from other studies (Grandi and Grimaldi, 2003; Colombo et al., 2004; Colombo and Grilli, 2010; Colombo and Piva, 2012) mainly because of the analysis performed (no previous cluster analysis on the population of Italian startup/NVT) and the target population (focus on a very early stage). In our analysis we try to collect knowledge on startups’ characteristics during the very first steps of their lives, and not ex post. As reported by Foo, Wong and Ong (2005), we know little about early phases of teams engaged in new venture activities and how variables as human capital affect team outcomes. The broad majority of researches on this matter are often performed when the venture has already successfully formed. One major challenge of studying early entrepreneurship in the Italian scenario is, as reported by Colombo and Piva (2012), to find complete information and univocal estimates on the Italian population of new innovative ventures. This is due to the fact that most individuals who are defined as “self-employed” by official statistics actually are salaried workers with atypical employment contracts. On the basis of official data, such individuals cannot be distinguished from entrepreneurs that create new ventures (Colombo and Grilli, 2005). The relevance of this work is represented by the exploration of a population that has so far been little studied, because of the already mentioned difficulties, and is in a peculiar instant of its life. For these reasons it is so important to look at startups even when they are not yet fully incorporated or operative, to better figure out how they evolve and what are the characteristics driving this evolution.

RESEARCH DESIGN AND METHODOLOGY

The core of this study is to explore the characteristics of Italian startups and of their founders, as a team and as individual entrepreneurs, as these topics appear to be the most critical factors both in the startup process and for company development and growth (Ucbasaran et al., 2003). We also focus on factors enhancing the development of the business idea and on team formation, analyzing factors that refer to the startup as a whole (“company specific factors”) as well as to single individuals composing the entrepreneurial team (“human capital”). In our work we combine data profiling the new ventures with the aggregation at team level of the individual characteristics of team members (i.e. entrepreneurs). Throughout this union we aim at identifying consistent clusters and the features that are significant for clusterization. In doing so we used dummy and categorical ordinal variables and we classified them using hierarchical cluster analysis. We run the classification following a post-hoc or no a priori technique, whose purpose is to define groups according to the data, as explained by Wedel and Kamakura (2002). In order to perform our analysis we chose the method of cluster analysis, since it “…can provide very rich descriptions of configurations without overspecifying the model” (1996, p. 442). As measure of proximity we use the squared Euclidean distance, and the hierarchical method is used to approach the analysis. Since we aim at producing an exploratory classification of observations,
taking into account that neither the clustering variables nor the number and nature of the resultant groups are strictly linked to deductive theory, the chosen method to identify clustering variables is the inductive one. In fact, as suggested by Ketchen and Shook (1996), we tried to consider as many variables as possible because it was not foreseeable what variables differentiate among observations. Moreover, as reported by Punj and Stewart (1983), there are no clear guidelines to determine the boundaries of clusters. Therefore, the use of many clustering variables is expected to maximize the likelihood of discovering meaningful differences. Due to the fact that our sample of data does not contain outliers, we decided not to use variables standardization. After transforming non-ordinal categorical variables into dummy variables, we needed to correct multicollinearity of data by reducing from to the possible modalities that the variable can assume. We also performed several tests to assess that this operation does not compromise the quality of the information provided.

To perform our analysis we chose a hierarchical algorithm that is the Ward’s method (Ward, 1963). As stressed by Ketchen and Shook (1996), Ward’s method is best suited for studies that present two characteristics: (i) the number of observations in each cluster are expected to be approximately equal; (ii) there are no outliers. Within our data set, it assigns observations with similar entrepreneurial and firm characteristics into progressively larger endogenously determined clusters. For determining the number of clusters in a data set, with regard to hierarchical methods, we followed the basic procedure as explained by Ketchen and Shook (1996). In order to evaluate the reliability of the obtained results we performed cluster analysis multiple times, changing algorithms and methods. In this way reliability is indicated by the degree of consistency in solutions (Ketchen and Shook, 1996).

Sample description

The final sample is composed of 107 Italian innovative startups and 254 entrepreneurs, spread into the different founding teams. Data were collected by the Mind the Bridge Foundation (MTB), a non-profit (501 c3) corporation based in San Francisco, through its business plan competition thought to scout new business projects with a strong commitment to innovation and marked ambitions of growth. As stated by Foo, Wong and Ong (2005), using data of participants of a business plan competition can be quite useful and relevant (i.e.: identify teams engaged in the early stages of the entrepreneurial process; scout firms and founders characteristics and perform longitudinal studies, monitoring the phenomenon in a specific area or region). The questionnaire submitted to the founders of the startups participating to the MTB Business Plan Competition was designed by MTB-CrESIT (Research Centre for Innovation and Life Science Management of Insubria University). More specifically, data gathered contains information on the new venture, such as the year of incorporation and place of establishment.
sector, number of founders, business description and available market data, company investment profile (capital raised and investors typology). Moreover, demographic information on the founders and management’s team are collected, such as date and place of birth, gender, education path, role played in the new venture, prior working experiences and prior entrepreneurial experience. Answers were on a voluntary basis and respondents could complete the questionnaire from June to July 2012. A small part of the received applications were discarded as being partially incomplete.

FINDINGS: ANALYTICAL PROCEDURE AND CLUSTER PROFILES

The analytical procedure we performed consisted of three main stages: identification of the number of clusters, assignation of observations to clusters, assessment of the stability of cluster’s solution (Stock and Zacharias, 2011). The findings of our analysis consist of three clusters, each one with its own characterization, and a set of variables which turned out to be significant for clusterization. The identification of the number of clusters was made using the dendrogram, as there were no significant jumps in the agglomeration coefficients. After the identification of the number of clusters by using the Ward linkage, the 107 firms of the sample are assigned into the three groups. The following table 1 summarizes the cluster distribution of variables, included in the research model, as a percentage of the total.

The level of significance of each variable is verified through a Chi-Square test. To calculate Chi-Square ($\chi^2$), we used a cross-tabulation which shows the frequencies of joint occurrences between variables. We tested the significance using $\alpha = 0.05$. There are five variables that are significant for the clusterization ($p$-value < 0.05), which are the following: (i) the startup has been funded ($\chi^2 = 28.08; df = 2; p$-value 0.000); (ii) the amount of capital raised to date ($\chi^2 = 85.979; df = 14; p$-value 0.000); (iii) at least one co-founder has one previous job experience ($\chi^2 = 17.942; df = 2; p$-value 0.000); (iv) average number of previous work experiences, as an aggregate of the team ($\chi^2 = 35.344; df = 4; p$-value 0.000); (v) average years of previous job experience, as an aggregate of the team ($\chi^2 = 52.584; df = 12; p$-value 0.000).

According to the distinctive features characterizing the identified clusters, we titled: Cluster 1: Techno entrepreneurs - 1st generation startups; Cluster 2: Employees turned entrepreneurs - Born into crisis startups; Cluster 3: Proven entrepreneurs - Scalable startups.

DISCUSSION AND CONCLUSION

Cluster 1: Techno entrepreneurs - 1st generation startups

“Techno entrepreneurs” are young entrepreneurs with a prevailing technical background and no prior job experience. In the majority of cases techno-startuppers are young adults whose first job experience is represented by the creation of a startup. In other cases, they are research fellows with a technical profile. Some of the latter declare previous entrepreneurial experience, although more likely via academic spin-offs rather than startups per se. The companies created by techno-startuppers (that we define as “1st generation startups”) raise funds mainly from co-founders (57%). The average amount of
capital received is quite small, comprised between 1 and 10 thousand Euros (38%). Some peculiar traits of these founders may explain why these startups raise limited funding. These include weak managerial background and almost no prior work experience that may compromise their ability in attracting more structured sources of funding. The founding teams are pretty lean (24% of the startups included in this cluster are one-man bands, i.e. only one founder). These ventures operate mainly in high-tech fields. Not surprisingly, the inspirational source of their business idea is represented primarily (62%) by the educational path undertaken by the co-founders, which is also responsible for their team formation often at an academic institution.

Cluster 2: Employees turned entrepreneurs - Born into crisis startups

Founding teams within this group are formed by individuals who mainly come from more conventional job positions. In fact, as reported by recent studies published by Italian Chambers of Commerce, with the advent of the financial crisis a lot of people who lost or were unsatisfied with their jobs reinvented themselves into startppers (a sort of “career pivoting”). This explains why among these teams we find individuals with a high level of job experience and long employment tenure. For these reasons we decided to label them as “Employees turned Entrepreneurs”. Individual achievement in many cases acts as a trigger in the decision of such individuals to become entrepreneurs. Thus, the need for independence and for self-recognition may turn into a strong push to become self-employed (Johnson et al., 2004). The companies created by these employees-turned-startuppers are what we define “Born into crisis startups”. Within this cluster, startups show a limited ability to raise capital (only 44% of them received external funds). The co-founders background is responsible for the low entrepreneurial attitude characterizing these startups. The prior work environment plays a critical role in this group, being the main source of inspiration of the business idea. Note that in 20% of the teams there is at least one female co-founder.

Cluster 3: Proven entrepreneurs - Scalable startups

Proven entrepreneurs are highly educated and experienced. This group is characterized by the highest level of education: 13% of the founders have a Ph.D. and almost one out of ten a MBA. They have strong managerial background (more than half of them have a degree in Business Administration) and are quite experienced. Almost all of them present prior job experience and 38% a previous entrepreneurial experience. Such percentage may look a little small. In fact, we believe that teams involved in these startups are driven and motivated by a precise and structured entrepreneurial idea, which explains why they are so good at fundraising. Furthermore, these founding teams present a broad international experience, as 31% of the co-founders had at least one job experience abroad and 25% attained a degree in a foreign university. The work environment (50%) represents the most
common place for future co-founders first meeting. This could mean that after they met and developed the business idea, which has quite varied origins, into an effective business model (Onetti et al., 2012; Onetti and Zucchella, 2014), they decided to become full-time entrepreneurs. Co-founders are characterized by different sources of specific knowledge, performing a good balance between technical and managerial skills. This seems to be a successful ingredient for the exploitation of the business idea. Evidence of this success is provided by the high amount of funds raised by these startups. Thus, we called the founders of such startups “Proven Entrepreneurs”. We define the companies that originated by these teams as “Scalable Startups”, since these ventures have greater efficacy in raising capital and, therefore, higher chances to succeed. All of them were successful at fundraising, and more than 30% raised more than 200 thousand Euros (50% more than 100 thousand Euros). They were able to attract funds from structured sources such as seed funds, foundations, accelerators and venture capitalists. Teams tend to be larger (22% of them are composed of more than four founders).

According to these clusters, some general considerations emerge. The degree of fundraising is significantly different. The first cluster displays scarce variety among the sources of funding and a limited ability to obtain medium-high amounts of capital. The second group shows limited abilities to raise capital: small percentage of firms with little funding. The third cluster, instead, presents an outstanding ability in raising money. The level of job experience of the founders is also fairly varied. The first cluster has a low level of experience at the aggregate level, both in terms of number of previous jobs and years of employment. The second group includes a sample of firms whose founders show a high level of work experience. The third cluster displays a good level of job experience and a stronger international attitude. These results are supported by literature. In fact, Shane and Khurana (2003) affirm that differences in career experience lead to differences in evaluations, by potential entrepreneurs themselves and by others, of an entrepreneur’s ability to: (i) access resources that help entrepreneurs in starting organizations; (ii) adapt to the role of the entrepreneur; (iii) continuously adapt the business model to market needs/changes.

Therefore, previous work experience is key in both venture creation and fundraising. First of all, Haveman and Cohen (1994) argue that individual’s career experiences have an impact on firms foundings. Furthermore, Shane and Khurana (2003) stress out that one of founders’ harder task is to convince others to reallocate resources in non-traditional ways. They state that if individuals are successful in their prior careers, they will be more likely able to convince not only potential investors, but also employees and other stakeholders. Hence, prior experience and career is positively related to the ability of obtaining resources. Shane and Cable (2002) provide evidence that experience is positively related to the ability of obtaining resources. For instance, they show that prior
entrepreneurial experience is an important predictor of the ability to obtain funds for a new venture. We have also seen that to be relevant for the final output are the characteristics of the entrepreneurial team as a whole. Indeed, today at the helm of innovative firms it is more likely to find NVT rather than one-man bands.

We believe these results to be very interesting, as they remark how work and international experience are crucial success factors for startups at the very early stage, as those participating to a business plan competition. In fact, these features are strong enablers of fundraising, which happens to be vital at this particular time, allowing startups to get off the ground and consequently grow. Then, our findings support the argument, inspired by competence-based theories, that founders’ capabilities and knowledge are a driver for startups growth. Innovative firms founded by individuals who have a higher level of work experience exhibit superior growth, with all else equal (Colombo and Grilli, 2005). Moreover, Colombo and Grilli (2005) asserted that startups established by such individuals are more likely to obtain external private equity financing, which of course has a sizeable positive effect on growth. The latter relationship is clearly visible in our results as well. Founders of firm belonging to cluster 3, in fact, present qualified international working experiences, so contributing to their startups’ ability to attract huge amount of funds from various sources.

With regard to further research, we identified two directions that, in our opinion, appear to be especially promising. First of all, recent studies (Klotz et al., 2014) suggest to examine how the characteristics of the firm are influenced by the stage of team development. For instance, firms and teams features may differ from the idea evolution phase to the exploitation phase. From the results presented in this work, it seems clear what are the team characteristics driving the startup evolution at a very early stage. Further analysis could highlight how those features may differ when the company reaches a later stage of development and fundraising is no longer the primary need. In addition, a cross-country analysis should be performed to better understand the positioning of the Italian startup ecosystem, and to allow to overcome the country specificities of the sample that lead to results that are not fully generalizable. Since accounting for the role of individuals in the startup process is critical for advancing theory, a cross-country comparison of sample of entrepreneurs/new venture teams may represent stimulating challenges for future research.

RADICAL INNOVATION OF BUSINESS MODEL- LESSONS FROM A BUSINESS-TO-BUSINESS SERVICES CASE

Philipson, Sarah
University of Gävle & Linnaeus University, Sweden

ABSTRACT

The concept of business modeling is fairly new and has been discussed in academia the last ten years (Amit & Zott, 2001; Chesbrough & Rosenbloom, 2002; Osterwalder, 2004; Chesbrough & Schwartz, 2007; Chesbrough, 2010; Yunus, Moingeon & Lehmann-Ortega, 2010; Teece, 2010; Stähler, 2002/2013-08-05). But in many ways it has similarities with the earlier concepts of dominant logic (Prahalad & Bettis, 1986; Bettis & Prahalad, 1995), and strategic fit (Porter, 1996).

This paper is an action research based case study of business modeling from idea conception to complete implementation. The presented case shows business modeling is a key to achieving strategic competitive advantage. More case studies will improve the scientific understanding of business modeling at the present stage of development.

Keywords: business model, value, customer needs, competitive advantage, dominant logic, strategy.

BACKGROUND

The concept of business modeling is fairly new and has been discussed in academia the last ten years (Amit & Zott, 2001; Chesbrough & Rosenbloom, 2002; Osterwalder, 2004; Chesbrough & Schwartz, 2007; Chesbrough, 2010; Yunus, Moingeon & Lehmann-Ortega, 2010; Teece, 2010; Stähler, 2002/2013-08-05). But in many ways it has similarities with the earlier concepts of dominant logic (Prahalad & Bettis, 1986; Bettis & Prahalad, 1995), and strategic fit (Porter, 1996).

Both theoretically and practically there is a lack of studies: “The paucity of literature (both theoretical and practical) on the topic is remarkable, given the importance of business design, particularly in the context of innovation. The economics literature has failed to even flag the importance of the phenomenon, in part because of an implicit assumption that markets are perfect or very nearly so. The strategy and organizations literature has done little better. Like other interdisciplinary topics, business models are frequently mentioned but rarely analyzed...”, Teece (2010:192).
One reason may be that it draws from and integrates a variety of academic and functional disciplines, gaining prominence in none, Chesbrough & Rosenbloom (2002:533). And for practitioners Bettis & Prahalad (1995:7) suggest that their research suggested how difficult highly intelligent managers found thinking strategically about businesses with different characteristics or their own core business, when the industry structure changed significantly. Hence, it is still valid to present and interpret practical examples in the form of cases of business modeling. We provide such a case based on our own action research.

THE CASE, ABB TRUCK SERVICE

Between 1982 and 1995 I worked as a management consultant for the ABB group. In 1988 Bengt Svensson, then CEO of ABB Truck - a subsidiary of ABB - suggested that I should re-engineer the business rationale of the service division of the company. ABB Truck produced big electrical forklift trucks for the European car, food and roll-on/roll-off industry. They lifted between 1,2 and 7 ton. On the Swedish market the service business had some 225 service technicians and 75 middle managers and administrators. The blue-collar workers’ union enthusiastically supported the project. ABB Truck Service was a business unit of ABB Truck AB, serving and repairing complicated machines at the customers’ sites.

THE TASK

The task was formulated as to radically improve the value for the industrial customers, which was interpreted as halving the down-time of the machines, and to radically reduce costs, in order to be competitive in the long run – give value for money. We also wanted to give the service technicians a better work environment by empowerment. Their union was interested in this aspect as well as to ensure the long-term competitiveness of the company, hence securing the jobs. This ensured their cooperation. As we intended to radically reduce the number of white-collar jobs, we did not expect to be able to co-operate with the white-collar union.

THE RE-ENGINEERING PROCESS

The objective of the project was to make the service radically more effective, eventually affecting the price of the services, as well as increasing the quality of the services. The local chair of the blue-collar workers union, ”Metal”, ”Johan S.” was heavily involved both in the envision and realization of the system.
The process was conducted in seven distinct but overlapping phases: 1) Formulate a new business idea, 2) Innovating a new way of organizing the business, 3) Develop new systems supporting the new organization, 4) Develop new routines for how to use the new system, 5) Educating the workforce in the new work methods, systems and routines, 6) Implementation of the new organization, and 7) Rationalization to achieve the second goal.

A NEW BUSINESS MODEL

We started by building a vision for how the division would function 7 years after the start of the project. The Service workers should be become ‘virtual entrepreneurs’, ordering spare parts and reporting work done. Through portable computers, with mobile phones as modems the technician should access exploded blueprints on central server for searching solutions to the problems with the faulting machine. Then the technician would order spare parts over the computer. These were flown in and arrived at the customer’s site the next day. After repair the technician reported his work through the server. An invoice was automatically generated and sent to the customer. With a printer under the passenger seat of the service car the technician would give the customers small quotes. Hence, an integrated workflow.

NEW CONCEPT OF ORGANIZING THE BUSINESS; NEW WORKFLOW

The number of workshops was to be reduced, the lion’s share would be done by technician at the customer’s site and only occasionally would a machine be brought in to the workshop. We would centralize the spare parts warehouse to enable overnight delivery from the nation’s principle airport; there would no longer be any spare parts administrators at local workshop. The new workflow was developed with detailed flow-mapping and was discussed in a reference group including the CEO of ABB Truck, the union leader, the division manager and the division controller.

NEW SYSTEMS

I then specified a systems architecture that could uphold this vision. I specified a central server, an IBM AS400 machine. It hosted all manuals with construction designs that could be “exploded” down to the smallest level of detail. It also hosted the database of the spare parts warehouse.

Then I designed the architecture for a client for the technicians. I verified every step of the coding and was the interface between business and information technology. To actually make the necessary server and client software, a computer consultancy was engaged. Installed in a portable computer, they were
given access to the server through a dial-up connection over a mobile phone. They also had a small printer installed under the passenger seat of their car. The work included 1) Functional specification of new spare parts system, 2) Functional specification of technicians’ order and reporting system, and 3) Project management of systematization and programming done by outside computer consultants.

NEW ROUTINES
The implementation was not self-evident. I developed a model routine to learn the workers and leaders what to make out of the system.

EDUCATING THE WORK FORCE
Together with the labor union’s representatives we educated the technicians in the use of the systems and the routines.

IMPLEMENTATION
The new spare parts center was built near Arlanda, outside Stockholm. Personal computers, mobile phones, and printers were bought for 225 technicians. In 1992, four years after the project had started, all technicians had received education and the necessary equipment.

RATIONALIZATION
As a major rationalization was that two-thirds of the 75 administrators were made redundant. Most of them where given pre-pension or other jobs in the ABB group. This rationalization of course influenced the future price of the service, and hence the value offered to clients.

RESULTS
Downtime of customers’ machines were reduced from 3 days to 1,5 day. OH reduced from 75 to 25 employees. The change took 4 years, from 1988 to 1992. When the whole ABB Truck group was taken over by Cargotec some years later, the closed the whole company except the new way of operating the service, giving it a value of 200 MUSD.

The most important effects where enhanced quality of service:
• The instant access to manuals reduced the time to find the defective detail and hence the time the machine was non-operational.
• The technician previously had ordered the spare part by phone from a local spare parts centre, where an administrator would manually identify if he had the part in stock. If not he had to order it from the factory. Often this entailed delays of three to four days. In the new organization the immediate order of spare-parts reduced the time to get the part, and hence the time the machine was non-operational. The missing part was sent by parcel post the same day from a centralized shipment center close to Arlanda, the main Swedish airport, arriving at the client’s site before noon the next day.
• The technicians where authorized to give the client minor quotes (up to some 1000 euros in present value), immediately printing the quote on his printer.
• The technician reported work time and the spare parts used over the system, directly generating an invoice in the central server. Apart from being the most important rationalising element, it meant that the quality of the information of the invoice increased, passing information directly from the primary source to the invoice.

All this were only changes in the technological service support system, but all of them radically increased the quality of service as well as decreasing the cost and hence the future price of the service. The overall process can be viewed as a design process, where the service was engineered or re-engineered. This design has consequences for the technological support system as well as for the actual service delivery system, both of the latter influencing the quality of service.

The business was limited to the Swedish market, as the mother company; ABB Truck AB, only sold to the European market and did not have a large enough market share outside Sweden to motivate a repair and service business, which instead was done by the partners’ selling the machines.

THEORETICAL INTERPRETATIONS

This case is an example of organizational innovation. "...new business models can themselves represent a form of innovation.”, Teece (2010:176). To change the ‘dominant logic’, Bettis & Prahalad (1995), cf. also Levitt (1960), in an industry, it is necessary to establish radical radical goals for the project. These goals are an example of what Prahalad (2006) calls the ‘innovation sandbox’, the challenging requirements for the project that is the necessary for radical innovation. You should "...start by identifying the core constraints that they must overcome to achieve a breakthrough innovation.”, Prahalad (2006:3). To halve the down-time is different from incremental innovation based on gradual increase of effectiveness. The requirement to reduce the overhead with more than 50% was also radical. Both requirements where inspired by the at the time current ‘T50’-projects
(halve-the-time) running in the ABB group. Of course the demands were less radical than the examples Prahalad (2012) gives of reducing the price for cataract surgery or a cooker for the Indian poor to 1/50th of the running price, but it is still radical, as the theoretical limit of the machine downtime – by flying in spare-parts ‘à la minute’ – would be some 6 hours and to an exuberant, not sustainable cost. We had to base our change on standardised parcel-post.

CUSTOMER NEEDS

"The chances of good design are greater if entrepreneurs and managers have a deep understanding of user needs...", Teece (2010:190). The formulation of the principles of the organisational change, must be based on intimate knowledge of the customers’ needs. "The starting point of the process was a detailed and in-depth understanding of the consumer...", Prahalad (2012:7). Innovations are often "...based on intuitive hunches rather than informed understanding...", Margolin (1997:227). See also Prahalad (2010). "Rather than researching markets, they must immerse themselves in the lives of their target consumers.", Prahalad (2006:7). Prahalad (2012:7) used video-ethnography to identify not only what people say they need. Many researchers have identified this intimate knowledge as a key for successful innovation and competitiveness. The strategy researcher Porter (1990) identified ‘commitment’ to the target group as a key antecedent to international competitiveness. This commitment permits the firm to gain an intimate knowledge of the customers. The entrepreneurship researcher von Hippel (1994) identified the ‘stickyness’ of needs information as a key issue for innovation, i.e. how to understand customers’ needs. Instead of ethnography von Hippel developed a method called the lead-user theory for how to learn these needs before the competitors, von Hippel (1986); Herstatt & von Hippel (1992); Urban, & von Hippel (1998); Olson & Bakke (2001); Lien et al. (2002); Lüthje & Herstatt (2004); Lettl et al. (2006), and Franke et al. (2006). These issues are discussed in many journals in different subfields, but the most important are ‘Management Science’, ′ The Journal of Product Innovation Management’, and ‘Design Studies’.

In the case I was not only a consultant with a specific task. I had worked with ABB Truck since 1985 (and with ABB since 1982) and had been working with organizational change in marketing, production, services, and made the specification for software to manage the short term rental fleet. During 8 months I was hired as regional general manager for sales and services, and negotiated a five-year rental contract (capital and service) with the Volvo Car corporation for 500 machines. I had an intimate knowledge of the business and the customers through visiting customers, and used the knowledge of other employees, most prominently that of the CEO and the union leader. But in retrospect it was risky not conducting a more systematic in-depth study of the needs of the clients.
BUSINESS MODEL

Research about business models is young, and "...relatively little concepts and tools exist to help managers capture, understand, communicate, design, analyze and change the business logic of their firm.", Osterwalder (2004:22).

Stähler (2002/2013-08-05) gave one of the earliest summaries of the essential elements of a business model.

<table>
<thead>
<tr>
<th>BM component</th>
<th>Questions to ask</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value Proposition</td>
<td>What value does the company create for customers and partners?</td>
</tr>
<tr>
<td>Product/Services</td>
<td>What does the firm sell?</td>
</tr>
<tr>
<td>Architecture</td>
<td>How and through what configuration is value created?</td>
</tr>
<tr>
<td>Revenue Model</td>
<td>How does the company earn money?</td>
</tr>
</tbody>
</table>

The *value proposition* of ABB Truck Service was to reduce downtime for the customers’ machines. The *architecture* was an integrated workflow that in more than 98% of the time gave the customer access to the machine within 36 hours. The price for customers was cost-based. In retrospect it could be question if this *pricing model* captured value the best; alternatives could have been a fixed price for each type of intervention or even a diminishing price after 36 hours had past – even if that might involve heavy extra costs for ABB Truck Service.

Recently Teece (2010) gave the definition, which is today most accepted in the literature: “The essence of a business model is in defining the manner by which the enterprise delivers value to customers, entices customers to pay for value, and converts those payments to profit.” “In essence, a business model embodies nothing less than the organizational and financial ‘architecture’ of a business.”, Teece (2010:172, 173).

He presented the following image as a summary of the most important elements of a business mode
BUSINESS MODELS AND STRATEGY

"...a business model is more generic than a business strategy. Coupling strategy analysis with business model analysis is necessary in order to protect whatever competitive advantage results from the design and implementation of new business models.", Teece (2101:180). Strategy is conceived as being thought out in advance, or planned. This ex ante assumption is valid in some cases, where the business model is a set-up that has been conceived in advance. For instance, Southwest Airlines may be have actually been built based on a pre-conceived strategy, Porter (1996). However, the more common situation involves strategy evolving as a result of a learning process, either by conscious experimenting (known in literature as ‘agility’), or the as a result of learning from unplanned reactive responses to competition or customer responses. This situation seems to have occurred with IKEA, where what has been perceived in retrospect as a planned process, was actually more the result of adaptation to customer response, Porter (1996).

The fundamental strategy question is how does one build a sustainable competitive advantage and get a super normal profit. It not enough to develop a successful business model to assure competitive advantage, as imitation is so easy, Teece (2010:173). Porter (1996:62) wrote that a company can outperform rivals only if it can establish a difference that it can preserve. Such a difference can be sustained if it can make many choices embedded in organizational praxis, which necessitate competitors to imitate not only discrete advantages. Hence that competitive advantage grows out of the entire system of activities. Rivals will get little benefit from imitation, unless they successfully match the whole system, Porter (1996:73-74). In the ABB Truck Service case the new competitive advantages were based on a large set of new activities: the online access to blow-ups of design.
drawings – online-order of spare parts – overnight delivery of spare parts – direct operator reporting of work done – immediate central invoicing. In order to copy the new achieved advantages, a competitor has to copy all elements, including training of the work force, and effective routines for handling of the system.

The new ‘business model’ we developed fulfills ‘Rosenbloom’s criteria’, Chesbrough (2010:355):

1. Articulates the value proposition
2. Identifies a market segment and specify the revenue generation mechanism
3. Defines the structure of the value chain required to create and distribute the offering and complementary assets needed to support position in the chain
4. Details the revenue mechanism(s) by which the firm will be paid for the offering
5. Estimates the cost structure and profit potential
6. Describes the position of the firm within the value network linking suppliers and customers
7. Formulates the competitive strategy by which the innovating firm will gain and hold advantage over rivals.

Chesbrough & Rosenbloom (2002:535) mean that strategy and business development is different and that strategy is superimposed on business models:

• The business model starts by creating value for the customer, and constructs the model around delivering that value. There is some attention to capture in a portion of the value created, but the emphasis upon value capture and sustainability much stronger in the realm of strategy.
• A second difference lies in the creation of value for the business, versus creation of value for the shareholder.
• A final difference is in the assumptions made about the state of knowledge held by the firm, its customers and third parties. The business model construct consciously assumes that this knowledge is cognitively limited, unbiased by the earlier success of the firm. Strategy generally requires careful, analytic calculation and choice, which assumes that there is a great deal of reliable information available. It similarly assumes that any cognitive limitations on the part of the firm are of limited importance.

I disagree, in my view the business model, how the firm intends to create value for a set of customers, is a prerequisite for profits, which thus are conditional of that value-creation – unless profits are a result of a rip-off.
Business models have been studied by among others Bettis & Prahalad (1995); Sawhney (1999); Amit & Zott (2001); Stähler (2002/2013-08-05); Chesbrough & Rosenbloom (2002); Osterwalder (2004); Chesbrough & Schwartz (2007); Andriopoulos & Lewis (2009); Chesbrough (2010); Doz & Kosonen (2010); Mets (2009); Teece (2010), and Yunus et al. (2010). Business models are considered as part of the strategy subfield and the most important journals in which the issue is discussed are the ‘Strategic Management Journal’ and ‘Long Range Planning’.

Other concepts and implications
The case could be viewed from many other perspectives, not discussed here: the performance effects of workers’ empowerment (McEwan & Sackett, 1998; Vidal, 2007; Udo & Ebiefung, 1999; Waldeck & Leffakis, 2007; Waldeck, 2007), strategies for implementing organisational change (Gupta, Chen & Chiang, 1997; Khazanchi, Lewis & Boyer, 2007), service innovation theories, and many others. Each of these issues is studied by specialized researchers, and often have specific journals more or less dedicated to such studies.

CONCLUSIONS
The presented case shows business modeling is a key to achieving strategic competitive advantage. More case studies will improve the scientific understanding of business modeling at the present stage of development.

The Future of Entrepreneurship

DOES FINANCE IMPROVE BUSINESS PERFORMANCE IN THE INFORMAL ECONOMY?

Pontus, Engström; Trond, Randøy

School of Business and Law, University of Agder, UiA, Kristiansand, Norway

ABSTRACT

This study investigates the impact of financial capital (microfinance) on the performance of micro-enterprises in the informal economy. The theoretical basis for this study is the Schumpeterian notion that entrepreneurs are able to create value due to their ability to make new resource combinations, of which financial capital is one of the most important and easily convertible resources. To test our hypotheses we apply a cross-sectional unique dataset of microenterprises in the informal sector in Ecuador. We observe how the provision of micro-loans, as a measure of financial capital, allows micro-entrepreneurs to multiply their income generating opportunities and achieve a higher return on equity (ROE). In addition, greater debt financing is positively related to the operating efficiency, measured as return on assets (ROA). Critical to the decision to exploit an entrepreneurial opportunity is also the entrepreneur’s financial literacy, and we find that entrepreneurs with a higher financial literacy achieve higher performance than others. However, an important observation is that growth comes at the expense of performance up to a certain size, implicating that diminishing economies of scale negate the positive effects of debt financing in the informal sector. Our results suggests that lending is best suited for firms with an asset size greater than USD 129,000. This has an important policy implication in that growing the size of a small business, through increased debt financing, may not necessarily lead to enhanced overall performance.

Keywords: microentrepreneurs, financial capital, microfinance, informal economy, financial literacy, firm performance

INTRODUCTION

Microenterprises are the common economic backbone of most poor and emerging economies. Most of these enterprises operate in the legal “shadow” or the informal economy1, representing up to 70% of GDP in some emerging economies versus 13% in higher income OECD countries (Schneider et al. 2010).

1 The informal economy is commonly defined as those income generating activities which are “unregulated by the institutions of society, in a legal and social environment in which similar activities are regulated” (Portes et al. 1989, p.12).
While research on the informal economy exists, it has largely been anecdotal with little theoretical underpinning (Webb et al. 2013), and has to a large extent been overlooked by mainstream entrepreneurship research (Bruton et al. 2008). In line with the call for future research on funding of microenterprises (Moss et al. 2014; Bruton et al. 2013), this study specifically assess if and how access to finance enhances entrepreneurial performance of microenterprises in the informal economy.

Microfinance has over the recent years emerged as a significant funding source for microenterprises in poor countries (CGAP 2014), supported by increasingly professionalized microfinance institutions (Randøy et al. 2013). Microfinance has been advocated as a tool to facilitate entrepreneurship and eradicate poverty (Pitt & Khandker 1998). While the link between access to finance and poverty has been extensively researched (Roodman & Morduch 2013; Khandker 2005), the link between access to finance and entrepreneurship in the informal sector has not. In our review of existing research we thus identify a gap in the literature, which due to microenterprises significant role in developing economies should be of public policy interest, and also help develop entrepreneurship theory (Bruton et al. 2013), both from a financing perspective but also from a growth aspect.

We use Ecuador as the empirical context of this study, which we argue is a representative example when studying entrepreneurship in the informal economy (World Bank 2012). First, there is an extensive informal economy (Canelas 2014; Schneider et al. 2010; Albornoz et al. 2011), and second there are well-developed regulated microfinance institutions specifically targeting the informal economy. Third, due to unique access to inside information from one major microfinance institution, we get access to microenterprises that have been seeking external financing from a microfinance institution. Forth, we also have data that allow us separate financing of business related activities versus financing of consumption. By assessing poor microentrepreneurs and their microenterprises in the informal side of an emerging economy, as called for by Moss et al. (2014), we are adding to the existing literature on the performance of microenterprises in the informal sector (De Mel et al. 2008; Honig 1998).

This article is organized as follows. First follows a review of entrepreneurship literature relating to entrepreneurial performance and access to financial capital in the informal sector. Second a series of hypotheses are developed. Third, the unique research methodology is presented including constructs and measures. Following this we test the hypothesis using an OLS regression technique. Last we discuss and conclude the findings, its limitations and implications for scholars as well as practitioners.
owners of microenterprises in the informal economy typically rely to a large degree on internal financing, as external formal bank-based debt or equity financing is not available to these actors. If external financing is available, it often comes at a high cost from moneylenders or other kind of informal providers of capital, so high that it deters from making any investments. Therefore microfinance institution comes in as a third alternative, bridging the formal and the informal economy, typically with much lower interest rates than informal money lenders. In seeking debt to finance an expanding business, the microentrepreneur, or the capitalist part of this individual, is also sharing the risk with external sources (e.g. the microfinance institution). If the entrepreneur is successful, the lending activity results in an improved performance of the business. We argue that little research attention has been made to the nature of the entrepreneurial opportunities in the informal sector, and the type of returns an entrepreneur can achieve.

If the entrepreneur is the specialist in risk-taking or alleviating uncertainty (Knight 1921), seeking an external financier may not only be a sign of lacking financial capital, but rather that the risks involved are too great for the entrepreneur to bear alone. We argue that the adverse self-selection by the entrepreneur, partly based on asymmetric information that the other sources of funding do not possess, makes the entrepreneur better informed about his or her capabilities. In order to deal with such adverse selection by entrepreneurs, the microfinance bank would conduct careful credit screening and apply interest rates and fees in order to compensate for the uncertainty of overly risky and/or unprofitable entrepreneurial investments or activities, and also to deter from these. If these interest rates are set too high, then none of the proposed investments will be undertaken, if set too low, the bank’s operations become unsustainable. To an entrepreneur, the cost of financing (cost of capital) is thus something to be weighted against the available opportunities and their economic returns. If a positive spread exists between the cost of borrowing and the investment opportunities, then financial theory says that value can be created through reinvesting and growing the business. The microenterprise should invest up to the point when the marginal benefit from an incremental investment is equal to the marginal cost.

Schumpeter (1934) describes the success of entrepreneurs in terms of an entrepreneurial profit. The empirical entrepreneurship literature uses various measures of performance such as efficiency, growth, profit, size, liquidity, success/failure, market share and leverage, often with a focus on the consequence of good performance. Among these measures, efficiency, growth and profit are the most common (Murphy et al. 1996). Increasingly some are also using a return to capital measure (McKenzie & Woodruff 2008; De Mel et al. 2008), but this is typically unavailability due to insufficient accounting numbers (requiring both income statement and balance sheet numbers).

---

1 The term moneylenders refers to informal providers of credit that are commonly charge 100% per year or more in interest rates and apply harsh collection methods.
Firm performance may be viewed from two perspectives – the entrepreneur-perspective and the firm perspective. From an entrepreneur-perspective, the main interest is the generated income in relation to the capital the entrepreneur has invested, the equity commitment, hence the most appropriate measure is Return on Equity (ROE). Return on Assets (ROA) on the other hand measures the return on all capital invested and is therefore a better proxy of the firm’s operating performance or efficiency.

Financial capital provides a medium of exchange and trade, and facilitates investments. This might be taken for granted in developed economies, but getting access to working capital is a major challenge among poor micro-entrepreneurs in the informal economy. The ability to exit the barter economy, where exchanging goods and services is complex and expensive, provide potential large saving to the entrepreneur. Research shows that financial capital as a medium of exchange lowers transaction costs and makes operating a business more efficient (Saving 1971; Jack & Suri 2011).

Financial capital may either be internally generated funds or available through external financing. In this study, the external financing will be seen as provision of debt from microfinance institutions. Financing a firm is dependent on the reinvestment opportunities and the availability of financing – which together make up the nature of the entrepreneurial opportunity (Shane & Venkataraman 2000). The decision to seek and obtain “financing” is essentially a decision to exploit an entrepreneurial opportunity, preceded by the discovery phase.

In capital constrained areas of the world, the lack of financing severally hinders entrepreneurship and firm growth (Ayyagari et al. 2008). Lacking capital is therefore a business risk, which affects the performance of the firm. While the seminal study by Modigliani & Miller (1958) proposes that capital structure (debt / equity ratio) is independent to performance of the firm, the intention by the authors was not to argue that capital structure is irrelevant (Miller 1988). In terms of the impact of financing on the performance of micro enterprises, there are a limited number of studies, especially from a less developed country and the informal economy.

Honig (1998) studied microenterprises in the informal economy in Jamaica, finding among other things the importance of considering heterogeneity among microenterprises, such as separating between those with employees and those with no employees. The study showed that those who received a business loan had a higher income, especially among the self-employed. Copestake et al. (2001) found in the case of Zambia that business performance and household income significantly improved upon taking a second loan, but for those, nearly half of the clients, who did not continue with their second loan fared worse. A qualitative case study by Hietalahti & Linden (2006) on poor women in the northern eastern South Africa revealed that some of the poorest women were able to improve their life modestly with access to microloans, but also highlight that the conditions for successful entrepreneurship differs depending on the degree of poverty.
In a recent quantitative study, Mahmood & Rosli (2013) study on Malaysian microenterprises that microcredit had a significant impact on the performance. A number of studies applying randomized control trials (RCTs) have in addition looked at the impact of business grants, also a form of financing, to microentrepreneurs. McKenzie & Woodruff (2008) found in an RCT on Mexican microenterprises monthly returns to capital of 20-33 percent which corresponded to a return between 3 and 5 times higher than the charged interest rate. The RCT did not adjust the returns for the opportunity cost of pursuing an alternative activity as argued by for instance Shane & Venkataraman (2000), therefore exaggerating the performance. De Mel et al. (2008) found in a study on Sri Lanka a monthly return on capital of 4.6-5.3% (55%-63% annually), also higher than prevailing interest rates, here deducting an opportunity cost of labor.

Because of the grant focus of existing randomized control studies, little attention is paid to how debt (the main instrument used in microfinance) affects firm performance. In addition, the randomized control trials are focused on very tiny businesses. Berge et al. (2011) looked at the effects of a small business grant, USD 60. De Mel et al. (2008) used a business grants of USD 100 to USD 200 to businesses with a maximum asset size of USD 1,000, where the size of these grants in some cases were equal to a value greater than the original capital invested. Small and equal grant based RCTs fail to take into account the different business needs, where a relatively small grant to a larger microenterprise, for instance with assets worth USD 1,000, will have a relatively little impact in comparison to the same size grant to a very small microenterprise with for instance assets worth USD 100. This study looks at the effect of an average total debt financing of between USD 2,628 and USD 41,623, thus capturing the effects of a more business varied financing, given the various nature of the businesses.

If microenterprises are provided with microfinance debt, we expect to see a positive impact on firm performance. Thus, one should expect the return on equity to increase and more earnings generated as these microenterprise are able to increase their disposable assets. In Figure 1, this is illustrated as the debt is used to acquire income-generating assets (the equity multiplier). If the reinvestment opportunities can be done at a rate of return which is higher than the lending rates, then value is created. Lacking capital is thus a constraint which hinders entrepreneurs from optimizing a realizable set of investment opportunities (Evans & Jovanovic 1989), including having access to sufficient working capital. In a setting where there are entrepreneurial opportunities present, financing allows the entrepreneur to exploit these opportunities. Net of interest expense and amortization, the microentrepreneur reaps the reward through an improved ROE, thus:

Hypothesis 1: Financing through microdebt is positively related to entrepreneurial performance (ROE).

Lacking access to debt not only prevents micro entrepreneurs from expanding their income generating activities, but it also hinders experimentation in general or using cash as a resource cushion (Cyert &
March 1963; Bourgeois 1981). While debt allows the income generating activities to be expanded, through the availability of financing and debt, the operating efficiency (ROA) can also be improved, if the entrepreneur can select opportunities with higher margins and or asset turnover. The second hypothesis thus reads:

Hypothesis 2: Financing through microdebt is positively related to entrepreneurial operating performance (ROA).

In the discovery of an entrepreneurial opportunity and the subsequent exploitation, the rate of borrowing needs to be compared against the expected financial return from the assets that the borrowing provides, especially when the financing is done with a regulated microfinance institution. This demands a certain level of financial literacy. Honig (1998) found in a Jamaican context different results based on education, suggesting no benefit to performance from high school education, but rather from college education. Thus, we suggest that entrepreneurs that are financially literate should outperform those who are not, such that:

Hypothesis 3: Financial literacy is positively related to entrepreneurial performance (ROE, ROA).

RESEARCH METHOD

Researching poor microentrepreneurs in emerging/developing economies provide a number of inherent challenges. Obtaining detailed data from the informal economy is for instance difficult as micro-entrepreneurs typically do not maintain financial records and in addition often mix family and business transactions. These challenges also include getting access to respondents, sample selection biases, the respondents weak knowledge of financial terminology; their ability to respond to surveys (with numbered Likert scales to mention one such challenge). Many of these challenges have been overcome with our unique research design.

In order to get access to microenterprise we have collaborated with Banco D-Miro from Ecuador. This microfinance institution is a regulated microfinance institution with 41,000 clients, based in the coastal regions, where a large part of the economy is informal. Banco D-Miro is owned by the Norwegian NGO Mission Alliance, a faith-based Christian organization. The roughly 100 credit officers who work at Banco D-Miro have manually collected financial data, partly through manually filled out application forms, but also including home visits, for the overall assessment of risk and credit worthiness of the clients. Prior to credit approval, the branch manager reviews the credit application. As credit default does not benefit the branch manager or the credit officer, this process vows for a better quality data, than an entirely self-reported measure of entrepreneurial performance. The data is very detailed and allows for fine-grained analysis of both income statements and balance sheet items, even separating family and business income and assets, thus allowing us to focus specifically on the performance of the
micro-enterprise. Data relating to both the balance and the income statement is obtained at the moment the microentrepreneur’s sought financing for their opportunities.

In addition to the data collected through the survey and the data collected by the credit officers of D-Miro, Ecuador’s microfinance institutions are by law required to report information to a credit bureau, which provide us with more individual credit information then is common in many other emerging informal economies (World Bank 2013). This process provides for complete picture of the microentrepreneurs financial situation, including loans to other financial institutions.

Lastly, to achieve a sufficient and representative sample for the statistical analysis we have used three available client categories of approximately 250 clients each: 1) clients who did not renew the loan, 2) clients with payment problems and 3) clients with no payment problems. All in all 755 microfinance clients are included. The respondents where then split into two groups, of which 480 had debt and 275 did not at the time of the loan application.

As a measure of the dependent variable, we are using the ROE and ROA in line with the discussion above. To avoid that outliers drive the results, the yearly ROE and ROA have been winsorized at the 5% level, such that for ROE, firms with an Equity of less than $2,500, had the equity set to $2,500, and for ROA, firms with a total assets less than $3,200 dollar, used an asset value of $3,200 (a similar approach to Hvide & Møen 2010). While the median ROE and ROA remained the same, at 73% and 63% respectively, the variance dropped by 94 and 96% to 73% for ROE and 28% for ROA.

In addition, since the microentrepreneur does not pay a formal salary to him/herself, we have added a proxy number for the opportunity cost of labour into the reported income, in line with suggestions from past research (Shane & Venkataraman 2000). While the minimum wage is intended to set a wage floor, the actual floor may be much lower in the informal sector if formal jobs or alternatives are not available. Canelas (2014) find, using data from the National Statistics and Census Institute of Ecuador, that informal wage workers earn on average 91% of the minimum wage during 2010-2012. We therefore assume that the opportunity cost of labour for the informal sector in Ecuador in 2013 to be the actual minimum wage of USD 318 multiplied by 91%, i.e. USD 289. As a result the median ROE was reduced from 63% to 44% and the median ROA from 63% to 37%.

Financial capital can be equity or debt. In the microfinance industry, the initial and most widely form of capital provided is microdebt. In this study we will look at two groups of micro-entrepreneurs; one group with debt (480 firms) and the other group with no debt (275 firms) at the time of seeking a new loan with Banco D-Miro.

Building upon a previously tested concept (Lusardi & Mitchell 2011a) we have used three questions to test entrepreneurs understanding of the financial concepts, compounded interest, inflation and
risk/diversification. The first two questions are directly from Lusardi & Mitchell (2011) whereas the third question was adapted to better fit this context. Three questions were asked:  
Suppose you had $100 in a savings account and the interest rate was 2% per year. After 5 years, how much do you think you would have in the account if you left the money to grow: more than $102, exactly $102, less than $102?  
Imagine that the interest rate on your savings account was 1% per year and inflation was 2% per year. After 1 year, would you be able to buy more than, exactly the same as, or less than today with the money in this account?  
Do you think that the following statement is true or false? Investing everything in one opportunity usually provides a more certain economic reward than investing smaller amounts in many different opportunities.  
We control for the entrepreneur’s gender as many microfinance programs typically favour women over men. In addition we control for age, education, and size. We use total assets, here Winsorized at the 5% level, for size and also include a transformed size-square measure to capture some of the unique characteristics of size. In addition, we control for industry using the definitions proposed by the United Nations for the informal sector (United Nations 2008, p. 279-281). Often, the informal sector is numerically dominated by manufacturing, repair services and trade. In the context of the informal sector of Ecuador, the sample is dominated by wholesale and retail trade (53%), of which the most common forms are clothing establishments, good and grocery retail, bazar and cosmetics followed by a number of smaller commercial businesses of varying kind. Following wholesale and retail trade was manufacturing (18%), restaurants (8%), agriculture, forestry and fishing (6%), transportation (5%), other personal service activities (4%), education; human health and social work activities (2%), construction (2%), repair services (2%) etc. Furthermore, the urban vs rural characteristics may also explain differences in performance (Honig 1998), wherefore this is also controlled for using the ratio of urban to rural persons living within the city area to which each microentrepreneur belongs using data from the National Statistics and Census Institute of Ecuador (INEC 2011).  

**ANALYSIS AND RESULTS**  
As seen in Table 1, the average annual revenue of the microenterprises is USD 26,688. These statistics are generally not available in previous research (Honig 1998; Copestake et al. 2001), which most often leaves us with the definition of a microenterprise as a business with less than 10 employees. Most firms in the data set have below 10 employees, with a limited number having reportedly up to 15 employees.
In terms of background variables, our sample include 12% rural microentrepreneurs and finds that 35% have completed primary school, 59% had finished or had some sort of secondary school degree, with only 4% attaining a higher degree beyond secondary education. In a similar study, Magill & Meyer (2005) found that for urban Ecuadorian enterprises, 46% had finished primary school, 41% had some or had completed a secondary education with 12% having an education beyond the secondary education. They note that these levels are higher than for the general population.

In line with Honig (1998), we have segmented the regression results based on being a business without employees or with employees. In addition, due to the informality, the notion of employment is vague, wherefore we also select those who say that at least two individuals, apart from themselves, work in their business. The regression in Table 4 indicates that when controlling for gender, age, urban vs rural, education and industry, there is a significant positive association between debt-funded microentrepreneurs and higher ROE for all cases and subgroups. This supports our first hypothesis that an increased level of debt is positively related to firm performance. Hypothesis two is also supported in that debt financing has a positive impact on the operating performance of the firm, ROA.

In terms of financial literacy, we find support that individuals with higher financial literacy also perform better. However, a deeper look at the analysis reveals that this only holds true among the microenterprises with no employees, suggesting that practitioners need to specifically teach financial literacy to these clients, prior to engaging in financing.
Among the control variables, the general level of education of the micro entrepreneur is not shown to have any impact on performance of the microenterprises they own. However, male entrepreneurs with no employees have a higher ROA than female. In addition, rural based microenterprises with no employees have higher performance. Among the industry controls, none of the industries had a significant impact on performance (ROE and ROA).

Size is negatively related to performance, however not all the time. In other words, adding another fridge or scaling the businesses in this local business environment comes at a cost since demand is fairly constant. By squaring the size factor we find that the size factor actually improves performance above a certain threshold (see figure 1). Up to a certain size, taking on debt is negative to the performance of the firm. This finding is supported by industry research from US Aid who found in their review of the informal sector in Ecuador that most microentrepreneurs were not convinced debt represented an opportunity to grow (Magill & Meyer 2005): “Credit is not seen as a positive tool to grow a business, but rather as a cost or penalty to be avoided at almost any cost” (p. 118), and recommend MFIs to exercise caution when “focusing on credit as a solution to the problems facing microentrepreneurs”.

However, after a certain size, financing starts to add value. In figure 1 below, it is shown that taking on debt worsens the performance for firms below USD 137,000 for ROA and USD 129,000 for ROE, in other words at the higher end of the sample used in this analysis. If the entrepreneur has employees, this lowers the break-even point somewhat. This has important policy implications. It illustrates how MFIs could analyze their existing clientele to find the cut-off point were financing does and does not add value. This allows MFIs to refocus their attention on the larger microenterprises where economic development and value creation is taking place, and avoid the smaller firms where financing actually depresses the performance on average.

In addition to separating between firms with no employees and firms with employees, the nature or industry may also show different effects (see Table 2), depending on the local conditions. The two largest industries represented in the sample are wholesale (and retail) trade and manufacturing, representing 71% of the sample. The regression analysis yields similar results for debt as an impact on the returns on the return for the wholesale trade sector, but is not yielding as strong signals for the manufacturing sector. We also see a different representation and impact of gender in wholesale trade.

**DISCUSSION AND CONCLUSION**

This study finds that microfinance as a tool to assist microenterprises in their growth, does not necessarily allow for value creation in the informal economy. Specifically, the study finds that while debt in itself improves performance, the increased size of the firm negates the positive effects on performance from debt financing. We operationalize entrepreneurial performance as the microenterprises’ Return on Equity (ROE) and its overall Return on Assets (ROA). We observe that the Ecuadorian microenterprises in our sample on average show very high average financial returns (adjusted ROA of 45% and ROE of 59%), which assuming no impact on returns from growth would lead us to assume growth is value creating. However, in the highly competitive environment of the informal economy in emerging economies, the incremental growth results in a drop in returns which
negates the value creation from growth. We call this the debt-growth trade-off. This has previously been identified as anecdotal evidence by practitioners (Magill & Meyer 2005), cautioning donor organizations to push finance as a means to support economic development, which is here given robust empirical support.

Financial competencies are generally seen as an important prerequisite for successful financial planning (Lusardi 2012), and we see the same pattern among microenterprises in Ecuador. Specifically, we find that microenterprises’ that are owned and managed by more financial literate micro-entrepreneurs display significantly higher financial performance, both in term of ROA and ROE. This suggests that financial literacy plays a role in the discovery and the decision to exploit an entrepreneurial opportunity in relation to a situation where external debt financing is required.

Specifically, this study makes three contributions to the microfinance and entrepreneurship, microfinance and growth literatures. First, it extends capital structure theory to micro-enterprises in emerging economies, and shown how financial return numbers can be successfully estimated even when being in the informal economy. Second, it adds to the literature on entrepreneurship, microfinance and growth literature by highlighting how debt impacts micro-enterprises’ financial return, specifically in relation to the size of the business, where smaller businesses see diminishing economies of scale, whereas the economies of scale occur mostly among the larger microenterprises. This has been recently called for by Bruton et al. (2011). Third, we contribute to the social entrepreneurship literature by establishing a connection between the social mission of a microfinance institution and its (potential) ability to reduce poverty is misdirected when specifically targeting the poorest and smallest businesses.

The study is not without limitation. We are limited by the fact that we attempt to infer causality (the impact of debt on performance) using a cross-sectional dataset. We have tried to reduce this problem by selecting micro-enterprises with and without debt prior to being include in the sample (and by that have an element of longitudinal design), and by trying to control for other potentially confounding variables such as gender, age of entrepreneur, industry etc. In future research, we suggest that the issue is pursued with longitudinal data. Another limitation is that there might be institutional and cultural variables that make generalizing beyond Ecuador difficult. This study is limited to micro-enterprises that have pursued on particular microfinance institution. For example, the fact that D-Micro is pursuing social goals, even though this is the norm in the industry, might impact the self-selection of microentrepreneurs that pursue this particular microfinance institution.

In terms of policy recommendations for practitioners, this study highlights that microfinance institutions and other donor organizations need to assert caution when extending credits to microentrepreneurs in the informal sector. The results highlight that larger microenterprises may
benefit more, and thus be a more suitable target when trying to create economic development. Our data also shows that financial literacy is important in the entrepreneurial process, particularly firms with a few several employees.

REFERENCES

ABSTRACT

The paper explores the country of origin (COO) effect in the wine sector with particular emphasis on the region of origin (ROO) as a factor when evaluating alternatives in the purchasing decision-making process. The ROO identifies key information about the product. It is now generally recognized that the terroir is a crucial attribute for the quality of a wine. We have focused on case study of the appellation of Chianti Classico on the German, British, USA and Canadian markets. The choice is motivated by the long history and international reputation of the Chianti Classico. Specifically, the paper aims to answer the following main research questions: what is the importance of the country of origin/region of origin assigned by consumers in an evaluation of Italian wines and the evaluation of Chianti Classico? Is there a relationship between the region of origin and knowledge of wine in the choice processes of the buyers? The image of the Chianti Classico influences the willingness to pay a premium in the analyzed markets included in the current study? Is there a difference in product perception and buying behavior among consumers of “Old” and “New World”? The analysis was conducted on a total sample of 2,380 consumers. The results confirm the importance of the COO and especially the ROO in the process of purchase of wine products. Specifically, it reveals that COO and ROO influence on the purchasing process in different ways, and that knowledge and a familiarity with a brand might have a moderating effect on purchase decisions. It was also found that in cases where consumers were not familiar with the product choices the ROO effect might be positive factor leading to acceptance of higher prices for wines originating in well recognized regions.

Keywords: Region of Origin, Country of Origin Effect, Knowledge, Wine

RELEVANT LITERATURE AND THEORETICAL BACKGROUND

During recent years the importance of the “made in” information as a cue in product evaluation has grown considerably (Bloemer et al., 2009) and many scholars have focused their research on the...
Country of Origin (COO) (Ashil and Sinha, 2004; Pucci et al., 2012) that is the country where the product is manufactured (Bilkey and Ness, 1982). The COO is a not-physical attribute of the product (extrinsic cues) on which consumers can base their purchasing decisions (Cattin et al., 1982; Kakamura and Agarwal, 1999), especially in situations in which intrinsic cues (e.g. design, taste, performance, etc.) lack or is not possible to evaluate them. The relevance of the origin depends on the cognitive relations that a consumer establishes between the place of origin of the product and the perceived quality of the attributes of the same (Verlegh and Steenkamp, 1999). This is particularly true for agricultural products (Thode and Maskulka, 1998), where the Region of Origin (ROO) identifies basic information about the product (Ittersum et al., 2003; Keown and Casey, 1995). The ROO is in fact an area with specific characteristics (e.g., tradition, culture, environment, etc.) identifiable from other areas of the Country. The ROO plays a decisive role in particular in the purchasing process of wine’s consumers and it is now generally accepted in the literature that the terroir is an attribute inextricably linked to the quality of the wine itself (Keown and Casey, 1995; Heslop et al., 2010; Remaud and Lockshin, 2009). The specific characteristics of the wine make it impossible to assess the quality before having consumed the product. Among the extrinsic cues the ROO is therefore one of the fundamental attributes of the wine product on which consumers can base the selection process (Schamel and Anderson, 2003; Perrouty et al., 2006). The importance of ROO is also recognized, in agri-food sector, by the existence of geographic indications (GIs) as protected geographical trademark (Čačić et al., 2011). Heslop et al., 2010 suggest that the ROO does not simply describe the origin of the product (extrinsic cue) but it also encompasses intrinsic attributes (e.g. the soil) which contribute to quality and taste of wine product. The ROO is therefore a complex attribute and its effect can be influenced by the knowledge that the consumer has about the product’s origin. On the one hand, the literature has shown that the effect of COO in the buying process is negatively associated with the level of product knowledge (Rao and Monroe, 1988; Maheswaran, 1994; Veale et al., 2006). In the case of ROO some researchers suggested that the use of ROO as a promotional instrument increases with the level of expertise of the consumer with respect to the evaluated wine category (Rasmussen and Lockshin, 1999; Guidry et al., 2009; Atkin and Johnson, 2010). Some authors have also suggested that this direct and positive relationship between knowledge and the effects of ROO may not be generalizable to regions whose popularity has spread independently of the region itself (e.g. Chianti, Brunello di Montalcino, Bordeaux, etc.). The research of Losi et al., 2012, suggests for example that in the case of internationally known wine regions, the ROO effect on wine purchasing process is strong not only for experienced consumers but also for those with little knowledge of wine choices.
The present work focuses on evaluating effects of COO in the wine sector with particular emphasis on the ROO as an attribute used by consumers when evaluating choices during. The case study that we develop is the appellation Chianti Classico in the American, German, Canadian and English markets. The choice is driven to a large extent by the long history and international reputation of Chianti (Keown and Casey, 1995; Famularo et al., 2010). The Chianti Classico appellation, in particular, is the most ancient area in the Chianti Region with a production of approximately 3% of the entire Italian wine production (Malorgio and Grazia, 2007). Secondly the appellation Chianti Classico historically has been oriented toward the generation of sales in export markets. According to the statistical reports of the Chianti Classico Wine Consortium (Consorzio Chianti Classico, 2010) in fact, the four countries under investigation represent the first four in terms of volume of exports.

In particular, we aim to answer the following four main research questions:

1. What is the relative importance of the country of origin/region of origin that might be assigned by consumers when evaluating Italian wines and Chianti Classico?

2. Does there exist a discernible relationship between the region of origin and knowledge of wine in the decision-making process of the consumer?

3. Does the image of the Chianti Classico brand influences the willingness to pay a premium in the evaluated markets?

4. Do product perceptions and buying behavior differ among consumers of “Old” vs. “New World”?

EMPIRICAL SETTING AND METHODOLOGY

The case study that we explore is that of the Chianti Classico wine. The territory of Chianti Classico was first officially identified in 1716 on legal notice by the Grand Duke of Tuscany Leopold III. At that point the production area (about 70,000 hectares) was delimited according to Italian ministerial decree in 1932 (Malorgio and Grazia, 2007). The recent legislation (ratified in 1996) establishes that the composition of the Chianti Classico wine has to be of minimum 80% Sangiovese grape and for a minimum of 20% of other red grapes varieties as for example Merlot or Cabernet Sauvignon (www.chianticlassico.com).

The research was based on a questionnaire composed of twelve closed questions (five of them using a Likert scale 1-5). The questionnaire concluded with five questions for demographic related questions including gender, age, income, employment and the level of education of respondents. The questionnaire was translated and corrected by a native speaker for each of the four countries included in the study and then retranslated into Italian to reflect any deviations from the understanding of the contained terms. The population of interest represents adults wine consumers. The sample consists of
2.380 consumers. The characteristics and the geographical distribution of the sample are shown in Table 1.

Note: * likert scale 1-5; ** Dichotomous variables

Table 1: Characteristics of the sample

Although the composition of the sample by area appears heterogeneous in terms of socio-demographic variables (age, education level, etc.), the sample size was appropriate considering our focus on cognitive processes vs the generalization of overall results (cf. Aiello et al., 2009).

RESULTS

To analyze the main research objective, a question which contained the relevance of different extrinsic and intrinsic cues was asked. Interviewees were initially asked to rate each attribute on a five-point answer scale ranging from “not at all important” to “extremely important”. The chosen cues were selected by different prior researches (Perrouty et al., 2006; McCutcheon et al., 2009; Atkin and...
Johnson, 2010; Spielmann and Babin, 2011). Five attributes were chosen: Brand name, COO/Appellation of Origin, Alcohol content, Grape variety and price.

Figure 1 compares the five attributes with reference to the wine in general with those specifically referring to the Chianti Classico wine. Values included in the continuous circles did not suggest a statistically significant difference at level $t < 99\%$. Values included in the dashed lines did not suggest a statistically significant difference at level $t < 95\%$.

With regard to the first research question, analysis indicates that the COO represents a critical attribute when purchasing wine, in particular for Canada (4.08) and Germany (3.83). It is also important, albeit less, for the U.S. (3.50) and the UK (3.05). In the purchasing of Chianti Classico wine the ROO is important for the American consumer (3.91) as well as for German (3.83) and Canadian consumers (3.64). Less important is for the UK market (2.86).

Figure 1: Comparison between relevant attributes in wine purchasing process and those in “Chianti Classico” wine

Figure 1: Comparison between relevant attributes in wine purchasing process and those in “Chianti Classico” wine
It also points out that for all four analyzed markets in the case Chianti Classico wine, the brand is more important than it is for the purchasing of wine in general, highlighting the Chianti Classico brand awareness compared to other wines. As for the attribute price, there are no significant differences with regard to the purchase of wine and buy wine Chianti Classico in any of the four markets although the variable appears more decisive with regard to the U.S. and UK. Finally, as regards the percentage of alcohol in the U.S. alone this variable is important.

To answer to the second and third research questions respondents were asked to rate (on a Likert scale) how strongly they associate each attribute with Italian wine and with Chianti Classico wine, from 1 as the lowest level of association to 5 as the highest level of association. In the first case, we attempt to assess the “country-related product image” (CRPI), namely the image of a specific product from a country (Bursi et al., 2012). In the second case, we evaluate the “region-related product image” (RRPI), namely the image of a specific product from a Region. All the attributes were selected by a previous research study Conducted by Zamparini et al., 2010, except from “trendy”, that in Zamparini’s study was called innovative. The same scale was used in Losi et al., 2012. Figure 1 compares CRPI and RRPI for each analyzed market. Values included in the circles do not have statistically significant difference at level $t < 99\%$.

First, it is evident that consumers of USA, Canada and UK associate to Chianti Classico wine each of the attributes proposed lower values compared to the same Italian wine (in all three cases, the gray line is in fact always below the darker line used for the CRPI). The image of Chianti Classico therefore seems to have a more significant value compared to Italian wines in general only for the German market.

Tradition/culture and high quality are the attribute with the highest associations with regard CRPI and RRPI for the U.S., Canada and Germany. UK also gives higher values to tradition / culture but acknowledges the major Italian wine elegance. The UK consumers are also those that differentiate more the image of the Chianti Classico wine from that of Italian wine in general.
USA consumers are those who attribute higher values to all the attributes both in the case of the Chianti Classico wine that in the case of Italian wine in general, and are also those for which the difference between the two perceptions (CRPI and RRPI) is the smallest.

Respondents were asked to assess the level of their wine knowledge (the last question in figure 3) and the level of the Italian wine knowledge. With reference to the Italian wine knowledge, this is rated according to the familiarity of respondents with Italian wine, to their ability to distinguish among different Italian wine regions and to their propensity to search on web some informations about Italian wines.
Canadian and British are the two groups of consumers with the highest knowledge of the wine products, 3.25 and 2.84 respectively. USA consumers exhibited the highest level of familiarity with Italian wines (3.22), while the Canadians were more able to differentiate among the different Italian wine regions (2.83). In order to gain Table 2 provides consumption information specific to Chianti Classico and shows the percentage of customers within each country that consumed at least once a Chianti Classico wine and visited at least once in the Region.

<table>

<td>66,39%</td>
<td>90,24%</td>
<td>56,97%</td>
</tr>
</tbody>
</table>

Table 2: Consumption experience and visit of the Region

Approximately 93% of Canadian respondents consumed at least once, a bottle of Chianti Classico wine and in 43,03% of cases they actually visited the region of production. The Germans have a high level of consumption experience (85,45%). Within the German sample also included were consumers who visited region of Chianti Classico the most (45,49%). Only in 9.76% of cases, however, American respondents also visited the region.
Finally, Table 3 shows the willingness to pay more for an Italian wine and for a Chianti Classico wine.

<table>
<thead>
<tr>
<th></th>

<tr>
<td>Are you willing to pay more for the purchase of a Chianti Classico wine?</td>
<td>Yes</td>
<td>56.58%</td>
<td>50.65%</td>
<td>54.88%</td>
</tr>
<tr>
<td></td>
<td>No</td>
<td>43.42%</td>
<td>49.35%</td>
<td>45.12%</td>
</tr>
</tbody>
</table>

Table 3: Willingness to pay more for an Italian wine and for a Chianti Classico wine

British consumers, Americans and Canadians in more than 60% of cases are willing to pay more for an Italian wine and in more than 50% of the cases would be willing to pay more for a Chianti Classico wine. Only in 38% of cases, however, German consumers recognized a greater value to Italian wine but in only 46% of cases they were willing to pay more for a bottle of Chianti Classico wine.

**DISCUSSION, CONCLUSION AND FURTHER RESEARCH**

This empirical analysis carried out confirms the importance of the COO and especially the ROO consideration when examining wine purchase decisions. The role of information on the country/region of origin can have a dual impact on the consumer’s evaluation process (Han, 1989): first the so-called “halo effect” namely the fact that the COO can serve as a qualitative signal in all those situations in which the consumer is not familiar with the product or the brand; secondly, the “summary effect” i.e. the abstraction process that takes place when an image of a country is grounded in previous experiences and perceptions of the attributes that characterize products from that country. In sum, the evaluation of the product quality or brands originating in a specific territory is based on the two effects cited (Yasin et al., 2007; Jaffe and Nebenzahl, 2001).

Despite the importance of COO and ROO in the process of wine purchasing by the consumers of the four countries analyzed, the comparison of Tables 1, 2 and 3 and Figures 1, 2 and 3 indicates a large heterogeneity in the perceptions of the attributes of the italian wines in general and Chianti Classico wine in particular. This shows how the effect of Country of Origin and Region of Origin depend strongly on the cultural context within which the two phenomena are analyzed.

The USA customers have a low knowledge of wine and use the COO information as an important element during the product evaluation process. The same consumers have a higher knowledge of Italian wine and assign importance to ROO when making choices. Ultimately, Americans were found to be willing to pay more for an Italian wines in general rather than specifically for a Chianti Classico.

The British have little knowledge of wine in general is that of Italian wine. COO and ROO have less effect on the purchasing process respect for U.S. consumers; however, are willing to pay more for an Italian wine or a Chianti Classico in particular. Canadians have high level of wine knowledge and a
high knowledge of Italian wines. COO and ROO are important in their buying process and they are willing to pay more for either Italian wines or a Chianti Classico. Even though an high percentage of Germans (85.45%) consumed a Chianti Classico wine, they were found to possess little knowledge of Italian wines and of wines in general. They use ROO and COO as considerations in the decision-making process but are willing to pay more for the Chianti Classico wine.

The results thus confirm that COO and ROO effects play a role the buying process in different ways, and also that knowledge and familiarity with the product might have a moderating effect on choice behavior. Even in cases that reflect a very limited knowledge, the effect of ROO is positive with respect to the willingness to recognize a premium price for wines from well known regions such as Chianti Classico (cf. German consumers), but it is also true that for expert consumers (e.g., Canadians) the effect of ROO is equally positive.

With regard to the final research question, it was concluded that there was no particular evidence that the ROO and COO effects are at work for consumers originating from “New World” (USA and Canada). The same applies for consumers coming from “Old World” (UK and Germany). In this regard, a repetition of our survey in different countries will deepen the understanding with regard to COO and ROO contributions to the overall choice process as experienced by wine consumers.

ABSTRACT

Two of the world’s largest markets, the EU and China, have initiated negotiations to lower down their markets’ barriers in pursuit of a multi-billion-dollar free-trade deal. Although the European Commission has proposed a new generation of competitiveness-driven bilateral free trade agreements with emerging and developing countries, some EU member countries are skeptical of China’s trade practices which have halted Brussels and Beijing negotiations. However, some EU officials have suggested that this agreement will be a stepping stone for future liberalization of the EU economy and that a free trade agreement with China is only a matter of time. The purpose of this study is to investigate the comparative advantage of EU members and China, how complementary trade is between the EU and China and how similar are the exports of these prospective FTA partners. This is a research paper based on secondary data analysis; data is obtained from various official entities. This study uses statistical and machine learning techniques in order to detect meaningful trade relationships between the EU and China.

Keywords: Free Trade Agreements, International Treaties, Bilateral Trade Agreements, Double Taxation Treaties, European Union, China

INTRODUCTION

In recent years, the trade partnership between the EU and China has developed significantly; China has become the EU’s biggest source of imports as well as one of the EU’s fastest growing export markets. Likewise, the EU has also become China’s biggest source of imports. It has been estimated that currently China and Europe’s trade surpasses €1 billion a day (European Commission, 2014). Despite this significant trade partnership development, the EU records an important trade deficit with China. This is in part a reflection of China’s extraordinary trade evolution, since it became a member of the WTO in 2001 (Rodrik, 2006; WTO, 2011). China’s exports rate of growth has been estimated to reach 30 percent a year before the financial crisis. Currently, around 70 percent of all goods manufactured in China are exported (Li et al., 2014).
China’s free trade policy has been driven by the need to secure its export growing trend and has been increasingly active in trade agreement negotiations with developed and developing countries. Since 2001, China has signed 12 trade agreements, it has six under negotiation and four under consideration; negotiations under consideration emphasize large markets such as the EU and US markets (Li et al., 2014). For a number of years, China has represented to the developed countries the opportunity of a low-cost labour force (Feenstra and Wei, 2009). Nowadays, this given fact is reversing as China is producing sophisticated components that require high-skill labour force that compete with developed countries’ manufacturing products. Such competition has been related to controversial issues associated with anti-dumping and unfair competition (European Commission, 2014).

The aim of this study is to investigate the comparative advantage of EU members and China, how complementary trade is between them and how similar are the exports of these prospective FTA members. The study reported in this paper can provide fundamental knowledge for policy makers in Europe, specially when updating the policy agenda for free trade negotiations. The remainder of this paper is organized as follows: section 2 introduces the conceptual background of bilateral investment agreements. Section 3 presents an overview of related literature in this topic of research, section 4 specifies the methodology utilized in this study. Section 5 presents the findings of our study, while section 6 addresses policy implications. Finally some conclusions and recommendations are provided in the section 7.

**CONCEPTUAL BACKGROUND**

Although the free trade doctrine dates back to the days of the famous economists Adam Smith and David Ricardo, it is only in the past three decades that countries from around the world have been embracing free trade agreements. The early doctrine of free trade advocated that free trade among countries leads to economic efficiencies through trade diversion. Today, the World Trade Organization (WTO) argues that free trade is directly associated with economic growth and development (WTO, 2011). The WTO promotes free trade negotiations intended at reducing international trade barriers and ensuring fair trade competition for all negotiating countries. Together with its predecessor organization the GATT, the WTO has established a strong international trading system from which 159 countries are members of this organization (WTO, 2014). Despite the growing recognition of the role of free trade agreements, there is no consensus on the definition of these legal instruments; however, the following definition explains some of the common features of free trade agreements:

“The WTO agreements cover goods, services and intellectual property. They spell out the principles of liberalization, and the permitted exceptions. They include individual countries’ commitments to lower
customs tariffs and other trade barriers, and to open and keep open services markets. They set procedures for settling disputes. They prescribe special treatment for developing countries. They require governments to make their trade policies transparent by notifying the WTO about laws in force and measures adopted, and through regular reports by the secretariat on countries’ trade policies.” World Trade Organization (2014)

Although the term Free Trade Agreements (FTAs) is commonly used for a variety of legal trade instruments such as bilateral trade agreement, regional trade agreement, free trade agreement, reciprocal trade agreement and preferential trade agreement, such instruments are used at different times and in different ways, differing largely from FTAs. Free Trade Agreements comprise preferential arrangements under which tariffs and some other barriers to trade are lowered only for those countries party to the agreement; these barriers for other countries are not reduced by the agreement (Brownsell et al., 2012). Therefore, distinguishing the characteristics of each of these legal instruments is an important endeavor in the assessment of their effects.

RELATED LITERATURE

The rapid increase of international trade flows in recent decades has motivated a large and growing body of academic literature in this field. Some theoretical and empirical papers go back to the fundamentals of the theory of comparative advantage developed by David Ricardo (1817). Ricardo argued that economic prosperity will increase when countries specialize in producing goods that have a lower opportunity cost and engage in trade exchange. The theory of comparative advantage, also known as the international trade theory, is one of the most famous theories in the field of international trade and has been conveyed by a number of economists among them Harberler (1930), Vainer (1937), McKenzie (1954), Jones (1961), Paul Samuelson (2001), Shiozawa (2007). While international trade theory states that benefits from trade come from the specialization in a country’s comparative advantage (Maneschi, 1999), the benefits of a country engaging in free trade agreements are stated by the theories of trade agreements.

In today’s economic literature, two theoretical approaches that offer a foundation for trade agreement analysis are found: the terms-of-trade theory and the commitment theory. Both theories suggest that countries engage in signing free trade agreements to enhance their economic development policies (Obradovic, 2012). However, these theories differentiate from each other by suggesting different reasons for signing these legal instruments. The terms-of-trade theory suggest that in the absence of trade agreements countries engage in war trade which is detrimental for all countries’ economy. This theory states that free trade agreements permit negotiating countries to cooperate and evade such trade war of protectionism (Maggi and Rodriguez-Clare, 2005). Whereas the commitment theory
suggests the benefit in signing a trade agreement follows from the negotiating governments committing to specific policies and to resisting pressures from domestic special interests groups. Although these theories are not mutually exclusive, both theories suggest that identification of the economic benefits for the negotiating countries as imperative (Bagwell and Staige, 2011).

There are considerable advantages for countries that engage in the liberalisation of tariff barriers which is the primary purpose of free trade agreements (Kirkwood 2011). In the present global economy, domestic industry attains significant commercial opportunities that are absent in the domestic economy. Trade liberalisation can be a positive force for economic growth and development; policies that reduce trade barriers facilitate the movement of goods and services, and deliver economic benefits (Stiglitz and Chalton, 2005; WTO, 2011). It has been found that by engaging in trade liberalisation, some countries have boosted their economy following exposure to international competition, via greater innovation and efficiency of domestic industry (Staiger and Tabellini, 1999). Despite some significant advantages that trade agreements may bring to a country, there are also significant challenges that trade liberalisation can deliver to the domestic economy; these can be directly attributed to the levels of skills of the labour force (Obradovic, 2012). However, evidence also suggests that trade liberalisation has not benefited other countries as some sectors of their economies were unable to compete in the international market; those sectors were mainly labour intensive sectors that produced low-priced goods (Stiglitz and Chalton, 2005). The World Trade Organization (WTO) tried to address these issues in the Doha Round in 2001.

The same year that the Doha Round commenced, China became a member of the WTO. China’s main reason for joining the World Trade Organization was the securing of access for its export sector into the global market (Li et al., 2014). The incorporation of China as a member of the WTO has greatly benefited its economy, seminal empirical studies have demonstrated the advantages China has obtained from its WTO membership (Van-Hoa, 2008). Chinese economic reforms that started in the late 1970s, have led to the emergence of the Chinese economy based on openness and competition. Today, one of the prominent feature of the Chinese economy is its economic competitiveness expressed in the outsized surplus of its balance of payments due to the outstanding performance of the export sector. The remarkable performance of the export sector is reflected in the impressive growth of Chinese GDP in recent decades (World Bank, 2013). This extraordinary economic growth has led China to surge as an economic and political world leader, impelling an interesting discussions among academic, policy makers and business leaders.

The Chinese export sector has been characterised by its labour intensive manufacturing and low cost of production, features that have been the main attractions for foreign investment (Rios-Morales and Brennan, 2010). Although China is the world’s manufacturing base, its considerable global presence in
international trade poses challenges to trading partners; some countries have experienced the decline of their exports due to strong Chinese competition (Feenstra and Wei, 2009). China has become an outstanding competitor in export markets, as well as the world’s largest importer of raw material, intermediate inputs, and other goods (WTO, 2011). Furthermore, its manufacturing sector has experienced rapid development and sophistication, producing exports labeled as high-tech (Wang and Wei, 2010). The Chinese government has been actively promoting the rising sophistication of the manufacturing sector through the creation of high-tech industrial zones around the country (Rodrik, 2006). The sophistication of the export sector indicates that manufacturing skills have also been upgraded; enhanced exports are directly attributed to higher levels of skills (Van-Hoa, 2008). Therefore, China has emerged as a direct competitor with producers in developed countries (Feenstra and Wei, 2009).

**METHODOLOGY**

The availability of comprehensive datasets and the very limited set of empirical studies on EU-China comparative advantages related to free trade agreements have motivated us to employ quantitative approaches to provide an assessment of the potential economic effects of the proposed free trade agreement. This is a research paper based on secondary data analysis; data is obtained from various official entities. This study uses statistical and machine learning techniques in order to detect meaningful and relevant trade relationships between the EU and China.

In order to be able to compare trends for economies that significantly differ in their size, we have computed relative rankings for a closed set of countries consisting of China and 27 EU countries. The computation starts by building two ordered lists of countries in respect of the value of their imports from some target country and exports to the same target country. Table 1 presents the lists for Austria in year 2012 for the total of all commodities.

**Table 4: Ordered lists for Austria**

<table>
<thead>
<tr>
<th>Country</th>
<th>Imports from Austria (in millions of USD)</th>
<th>Import rank</th>
<th>Country</th>
<th>Exports to Austria (in millions of USD)</th>
<th>Export rank</th>

<td>1</td>
<td>Malta</td>
<td>8</td>
<td>1</td>
</tr>
</tbody>
</table>

The positions of countries in the lists determine their export and import ranks. The country that is first in the list has rank 27 while the last one has rank 1. Taking Austria as an example, Germany has both...
import and export ranks of 27 while Malta has both ranks of 1. Relative rank is defined as the difference between the export and the import ranks for the same country:

\[ \text{Relative_rank} = \text{Export_rank} - \text{Import_rank} \]

When Austria is the target, then in year 2012 relative ranks for Germany, Italy, Cyprus, Malta and some other countries are 0 because they have identical export and import ranks. The largest relative rank of 9 relates to the Netherlands (export rank 25, import rank 16) while the smallest value of -4 relates France (export rank 21, import rank 25) while China’s relative rank is -4 (export rank 15, import rank 19). Higher values of relative ranking are characteristic of more export oriented economies.

The total relative rank for an individual country is the sum of relative ranks computed for in respect of all of the other members of the closed set of 28 countries:

\[ \text{Total_relative_rank} = \sum_{\text{all_members}} \text{Relative_rank} \]

For the year 2012 for the total of all product types, the highest total relative rank in the set of 28 countries obtains for China and equals 135. The lowest value obtains for the UK and equals -84.

A characteristic of the above defined measure is that it defines export/import characteristics of a country regardless of the actual size of the economy and regardless of general trends in international trade. For example, it means that in spite of absolute increasing trade data, the ranking of a country can be decreasing. The methodology is especially appropriate for recognizing long term trends.

**FINDINGS**

Our findings suggest that trade between the EU and China have risen at a substantial rate since 2003. In recent years, China has become the EU’s biggest source of imports as well as one of the EU’s fastest growing export markets. Likewise, the EU has also become China’s largest source of imports. It has been estimated that currently China and Europe’s trade surpasses €1 billion a day (European Commission, 2014). In the context of the development of this significant trade partnership, the EU records a significant trade deficit with China (figure 1). In 2012, the EU-China trade ratio was 0.55 (total EU exports of goods to China divided by total EU imports of goods from China). It was also found that among the EU countries, Austria and Germany have a positive trade balance with China, with ratios of 1.65 and 1.24, respectively. However, for all other EU countries the ratio was below 1.0.
Figure 1: EU27 to China total exports and total imports (in billions of USD)

Total all commodities EU27 exports and imports from China in billions of dollars.

In terms of comparative advantages, we have found that the EU has comparative advantages over China in trade for the following commodities: high-skill (ratio 1.34) and medium-skill technology-intensive manufacturing products (ratio 1.96), road vehicles (ratio 4.57), primary products (ratio 1.69), and chemical products (1.19). For the following items EU has ratios less than one: manufactured goods (ratio 0.48), machinery and transport equipment (ratio 0.67), miscellaneous manufactured articles (ratio 0.13), labour-intensive and resource-intensive manufactures (ratio 0.08), office machines and automatic data processing machines (ratio 0.03).

Figure 2: Ratio of EU exports to and imports from China for high skill manufactures. France, Sweden, and Ireland had highest ratio among all EU27 countries in year 2012.
Ratio of exports and imports from China for high skill manufactures. It is presented as a total for all EU27 (blue) and for France, Sweden, and Ireland that had highest ratio among all EU27 countries in year 2012.

High-skill and technology-intensive manufactured products are potentially very relevant for EU. In year 2012 they represented 20% of total EU export. Among EU countries most successful have been France (ratio 4.06), Sweden (ratio 3.77), and Ireland (ratio 2.90) (Figure 2). In this respect the most interesting is Sweden which has recorded an almost constant increase of the export/import ratio of high-skill products with China over a period of 15 years. Large differences among EU countries can be noticed. Many less developed EU countries have a ratio in high-skill products of less than one. Actually, significant changes can be noticed within EU. When we look at the ranking data (Figure 3) then Poland is a success story with increase of almost 35 ranks in the period of 10 years. In year 2002 Poland has been a strong high-skill product importer with relative rank equal -95 while in year 2012 it had relative rank -60. In the same period Sweden has lost almost 25 ranks within EU (from rank 51 to rank 31) in spite of its success in respect of China.

Figure 3: Total relative rank for high-skill and technology-intensive manufactures

In terms of skills, China demonstrates advantage over the EU in labour-intensive and resource-intensive manufactures exports. In terms of relative ranks, China has an almost constantly very high score of between 300 and 350 for labour-intensive products. Even in the case of a free trade agreement it can be expected that that relation will remain very similar. China demonstrates superiority over the EU also in low-skill and technology-intensive manufactured exports. In contrast to labor-intensive products there has been a significant Chinese increase in the period 1995-1999 but now it is almost constant with relative rank about 200 (figure 4). Among EU countries the most significant changes over the period of 10 years for low-skill products are in respect of UK and Poland. UK has lost 60 ranks (from -39 to -99) while Poland has lost 35 ranks (from rank 8 to rank -27).
Medium-skill and technology-intensive manufactured exports has been the field of most notable changes in the period of the last 15 years (Figure 5). China has increased its relative rank from -81 to +85! The maximal value has been rank 128 in year 2008. The Czech Republic has been a constant success story within the EU. In the last 15 year period its relative rank has increased from 49 to 67. Even more significant has been the decline of Sweden. Its relative rank has decreased from 27 to -44. It may be assumed that similar trends will continue also in the near future and that changes may be even stronger in case of the free trade agreement with China.

Relative ranking data demonstrate most significant EU-China changes in respect of all food items, beverages and tobacco products, and agricultural raw materials. Currently these goods present a very small part of total trade, but in all of them, the EU has potential for significant export increase consistent with the significant change in the data in the past ten years in favor of EU countries.
The complementarities of the EU and China can provide opportunities for economic development. While the Chinese market becomes significant for EU exports, the EU Commission needs to be aware of the challenges that EU firms might face in the future in terms of competitiveness. EU authorities must ensure that this free trade agreement works both ways.

POLICY IMPLICATIONS

Despite the extraordinary surge in trade between the EU and China and the interest that this topic has impelled among policymakers, market players and scholars, academic research in this particular field of research is limited. This study is contributing to scientific research in the field of international business. It will also provide fundamental knowledge for policy makers in Europe, specially when updating the policy agenda of free trade negotiations.

CONCLUSIONS AND RECOMMENDATIONS

While trade partnership between the EU and China represents enormous opportunities for both markets, the fast growing sophistication of Chinese manufacturing, in the last past decade, denotes some challenges for the European manufacturing sector. Our study confirms that China records a significant trade surplus with Europe. This study also suggests that China has not only developed competitive advantage over the EU in labour-intensive and resource-intensive manufactured exports, but has also demonstrates over the period of the past 15 years, that medium-skill and technology-intensive manufactured exports have developed advantages over the EU. In this sector, China has increased its relative rank from -81 to +85. It may be assumed that similar trends will continue in the near future and that changes may be even stronger in case of the free trade agreement with China.

Behind China’s impressive transformation in becoming one the world’s biggest trading powers and of the development of its industrial structure has been China’s governmental policy regime. These policies of promotion and protection have shaped the export basket with a range of increasingly sophisticated products directed to the export market (Rodrik, 2006) and have been the main driving forces of exports sophistication; hence, China signifies a direct competitor of developed countries’ manufacturers (Feenstra and Wei, 2009). Therefore, the EU member countries and the Commission need to be aware of the challenges that EU firms are likely to face in the future in terms of competitiveness. EU authorities must ensure that any free trade agreement works both ways.

RELATIONSHIP MARKETING IN THE COMMUNITY PHARMACY: THE IMPACT OF NETWORK LOYALTY PROGRAMS ON STORE LOYALTY

Rodrigues, Catarina¹; Nobre, Helena²; Becker, Kip³

¹University of Minho, Portugal
²University of Aveiro, Portugal
³Boston University, Metropolitan College, USA

ABSTRACT

The research was designed to explore the importance of loyalty programs in today’s competitive community pharmacy environment. Although this marketing tool is used to promote a loyal behavior of the customer, the results show a weak relationship between program loyalty and store (pharmacy) loyalty. This indicates that in order to create a successful competitive advantage for the pharmacy a loyalty program needs to be of value, rare, not perfectly imitated or easily replaced. When analyzing the value perception construct, the results indicated the importance of the psychological benefits of belonging to a loyalty program. When the loyalty program is implemented, not as a resource strategy, but as a “me too” strategy it is more likely not to meet marketing expectations and the expected benefits. Additionally, the authors analyze the effects of household characteristics on program perceived value.

Keywords: Network loyalty programs, pharmacy, network strategy, marketing loyalty

INTRODUCTION

One of the most remarkable trends over the two decade in marketing has been a change of focus from single transactions to relationships (Grönroos, 1994; Hennig-Thurau & Hansen, 2000). The 60’s predominated marketing-mix concept and the 4P’s model, with the development of industrial marketing and services marketing, has given rise to a need for an alternative approach to the marketing concept (Aijo, 1996; Grönroos, 1996; Gummesson, 1987), that better reflected the relationships that were incorporated in the marketing-mix (Waterschoot & Bulte, 1992). Grönroos (1994, p. 9), extending the initial definition of Leonard Berry in 1983, defines the goal of relationship marketing (RM) as “establish, maintain, and enhance relationships with customers and other partners, at a profit, so that the objectives of the parties involved are met.” The most successful buyer-seller relationships are characterized by mutual trust and sharing of information and continuous display of commitment and satisfactory performance of the partner’s respective role (Barnes, 1994). The tangible
benefits of the adoption of RM strategies were first published in 1990 by Dawkins and Reichheld. They stated that a higher rate of retention corresponds to a higher profit for the company (Dawkins & Reichheld, 1990). These effects are explained by the fact that a company that targets the retention rate is supported by a solid base of repeat sales (Dawkins & Reichheld, 1990), by the positive word-of-mouth (Bowen & Shoemaker, 1998) and by the fact that a loyal customer tends to spend more than a new one (Bhattacharya & Bolton, 2000). Loyalty is now seen as one of the most important drivers of success in a business (Reichheld, 1996) making it the core goal of any strategic planning in marketing (Dick & Basu, 1994; Diller, 2000). As a result the last decade has seen the blossoming of the loyalty programs (LP) market, especially in retail organizations (Sharp & Sharp, 1997). LP are defined as an integrated system of marketing actions that reward and, therefore, enhance the loyal behavior of the customer through several economic, psychological and sociological mechanisms (Leenheer, van Heerde, Bijmolt, & Smidts, 2007). Despite the wide interest LP, few studies are devoted to the potential impacts of the LP on actual consumer behavior, and the research provides contradictory outcomes (Meyer-Waarden, 2007).

CONCEPTUAL MODEL AND HYPOTHESES OF STUDY

The launch of any LP has as main objective to strengthen the relationship between the focal store and its customers, in order to differentiate it and to provide new approaches to address an increasingly competitive market. In the case of network LPs, where the management of the LP is made by a specific company, but the ownership of the LP is distributed through several firms, it is much easier to established the firm’s critical size, such as number of memberships, but this also means that the firm has limited influence on his LP strategy (Reinartz, 2006). And, recognizing that an LP does entail costs, including financial, labor and psychological capital (Uncles, Dowling, & Hammond, 2003), the authors studied antecedents and consequences of network LPs when applied to community pharmacy business. The conceptual model that forms the basis of the study is presented in figure 1. Based on the bibliographic research, six hypotheses were generated, focusing on the relationships between value perception, program satisfaction, program loyalty and store (pharmacy) loyalty. Additionally, the authors analyze the effects of household characteristics on program perceived value.
**The effects of value perception on loyalty**

According to O’Brien and Jones (1995) a LP that effectively promotes store loyalty should combine five elements that, when together, determine the value of the program: (1) cash value of redemption rewards, (2) redemption choice, (3) aspirational value, (4) perceived likelihood of achieving rewards, and (4) the scheme’s ease of use. These perceived benefits may help us understand why customers join LP and, as consequence, how this benefits drive loyalty (Mimouni-Chaabane & Volle, 2010).

H1a: The loyalty program will be positively influenced by the program perceived value.

H1b: The program satisfaction will be positively influenced by the program perceived value.

H1c: Value perception positively influences store loyalty.

**The mediator effect of satisfaction in the value/loyalty relationship**

Satisfied customers tend to concentrate their purchases within the same company more so than those customers who are not satisfied. As a result satisfaction is an important determinant of loyalty (Yang & Peterson, 2004).

H2a: Program satisfaction will have a positive effect on store loyalty.

H2b: Program loyalty will be positively influenced by program satisfaction.

**The effects of loyalty programs on loyalty**

As referred before, empirical evidence available on the effectiveness of the LP is limited and contradictory (Lewis, 2004; Mägi, 2003; Meyer-Waarden, 2007). Some researchers do express their doubts about the benefits of LP and suggest that, in a competitive market, good programs are imitated. Once the program has become generic across competing firms there would be a return to the initial situation (Meyer-Waarden, 2007; Yi & Jeon, 2003). Despite the empirical evidence, it seems...
intuitive that LP members concentrate their purchases on a particular company and are less likely to
visit competitors. In the case of network LPs, this relationship between program loyalty and store
loyalty may not be observed since the member can distribute their purchases through several firms,
and still continue to gather benefits from the LP.
H3: Store loyalty will be positively influenced by program loyalty.

The effects of household characteristics on program perceived value
Not all customers associate the same benefits to a certain LP (Allaway, Gooner, Berkowitz, & Davis,
2006; Mimouni-Chaabane & Volle, 2010), making it plausible that any effect of the LP in the costumer
behavior will be moderated by some member’s characteristics (Mägi, 2003). Because it is difficult to
suggest what individual factors are important, or to determine the direction of their impact, the
authors did not derive a specific hypotheses related to this assumption but base this on the research
related to individual differences as an exploratory character.
H4: The household characteristics influence the program perceived value.

METHOD
A survey was carried out in a community pharmacy in Vila Verde, a town in the north of Portugal. It
is also noted that while community pharmacies in Portugal are represented by one major institution
they do compete individually in their market environment. The network LP in this environment is
analyzed and results shared by several community pharmacies who then gather the combined benefits
of their collective effort. The data for this study was collected by using self-administered
questionnaires distributed using convenience sample technique. The population of interest for this
study was defined as consumers of a focal community pharmacy who were member of the LP. The
survey instrument used a comprehensive set of 17 questions that were directly tied to the four
constructs of the study. The interval scale was anchored using a Likert type measurement approach.
Five response categories with properties labeling for the scale end points form (1) which denotes
“strongly disagree”, and (5) for “strongly agree”. Following the conduction of a pretest to verify the
suitability of the terminology used as well as clarity of the instructions and scales, to more questions
were added to characterize the type of experience the member as with the LP (reward redemption and
membership time length). A total of 72 surveys were validated (See table 1).

**DATA PROFILE**

Customer’s sample (N=72) included 53 (76.8%) females and 16 (23.2%) males and more than 50% of the respondents aged between 24 and 44 years old. Most of the individuals had a household of three
people (34.7%) and most of them also didn’t have infants in their family household (58.3%). Table 2 provides a general result of customers sample profile.

Another important statistic was the length of experience with the LP. 70.5% of the respondents claimed that they were members for more than one year, however only 51.4% of them had already redeem points.

RESULTS

In order to explore the various relationships proposed in the conceptual model, the Pearson’s correlation coefficients (R) and the determination coefficient (R²) were calculated between the latent constructs. The Pearson’s correlations between the independent variable perceived value and dependent variables program satisfaction, program loyalty and store loyalty were analyzed. This analysis demonstrated two strong correlations: between perceived value and program satisfaction (r = 0.74, p <0.01) and between perceived value and program loyalty (r = 0.64, p <0.01). Analysis between the variable perceived value and store loyalty resulted in a moderate correlation (r = 0.419, p <0.01).

The extracted correlation from the analysis of the independent variable satisfaction and the dependent variable program loyalty has shown to be very strong (r = 0.82, p <0.01). Regarding the program satisfaction variable and the variable store loyalty a moderate correlation (r = 0.496, p <0.01) was found. Also moderate (r = 0.493, p <0.01) is the correlation between the independent variable program loyalty and store loyalty.

To assess whether the program perceived value is dependent on some characteristics of the household, we resorted to the use of the chi-square test (X²) implemented in the software of statistical analysis SPSS Statistics (v.21 software, IBM SPSS, Chicago, IL). The inferential statistical analysis does suggest that the program perceived value is independent of the number of people in the household (X² = 71.7, p = 0.421, N = 70), the existence of infants in the household (X² = 19.1, p = 0.163, N = 71) and age (X² = 64.5, p = 0.663, N = 71). It is also possible to claim that the program perceived value construct is dependent on the marital status of the member of the program (X² = 70.6, p = 0.004, N = 71). See table 3 for results of the hypotheses tested.

DISCUSSION

One of the primary goals of this study was the evaluation of a network LP from the perspective of the pharmacy costumer. The results provide a more focused and better understanding of the process of developing an effective LP that is able to satisfy their members (consumers) and as a consequence of that satisfaction create a loyalty to the pharmacy. The incorporation of program perceived value and program satisfaction permitted the authors to test the importance of these constructs on the formation of loyalty towards the store program. As highlighted in table 2, the study determined a strong empirical support for several of the hypothesis (H1a, H1b and H2b). The study also determined there was empirical evidence supporting that members of a network LP who recognize value to the program are satisfied with it and, as a result, engage in behaviors that strengthen their relationship with the community pharmacy. These results are in agreement with previous studies (Sunny Hu et al., 2010; Yi & Jeon, 2003). It should, however, be noted that, by splitting the path between program perceived value and store loyalty in two ways it was determined that the positive influence that perceived value has upon store loyalty is stronger if a loyalty program exists. This result is in agreement with previous studies (Sunny Hu et al., 2010; Yi & Jeon, 2003) that explain the mediator effect of program loyalty on store loyalty. However, unlike the outcome of these previous studies that found no significant correlation between program perceived value and store loyalty the authors established a positive correlation, although moderate, between the two constructs.

The results indicate that the value of the loyalty program is perceived by consumers and that these consumers are satisfied with it. It should be noted, however, that many of the program members, while claiming to be satisfied with the loyalty program never actually collected (enjoyed) the tangible benefits which were the possibility of exchanging loyalty points for products. Possibly, the psychological benefits of belonging to the LP and accumulating points have an important role in the construction of their perceptions of value and consumer satisfaction levels, as suggested by Dowling and Uncles (1997) even when these same consumers do not actually participate in the tangible benefits of the program. In line with this reasoning are the results of Arbore and Estes (2013) who explored the role of psychological benefits, and how the LP through the possibility of rewarding its members with prizes or discounts can influence their perceived status.

The assumptions of the authors that the program’s perceived value would vary according to age and depending on the type of household were not confirmed. This result contradicts the results of previous studies (Meyer-Waarden & Benavent, 2003) that reported the possession and use of LP is dependent on the different life cycles and that are function, for example, of age and profession.
CONCLUSION

As Barney (1991) stated in his work, in order to any strategic resource to become a sustained competitive advantage it has to be valuable, rare, imperfectly imitable and non-substitutable. The weak correlation between program loyalty and store loyalty could be explained by the fact that this network LP is not exclusive property of the focal pharmacy. This implies that there may be members who are only loyal to the program (not the specific store) and will dividing their purchases among the several pharmacies within the same loyalty program. Regardless of type and goal to be achieved with the LP any program should have as its strategic objective to contribute to increase the operating profit of the company. This finding may have consequences for companies that use a franchise system where a central loyalty program could increase overall firm profits but not promote a unique loyalty/profitability to a specific store. The findings also indicate that as more firms come under competitive pressure to adopt LPs as a marketing tool without a clearly developed strategy such programs may not generate a competitive advantage for the company.

RESEARCH LIMITATIONS

In consideration of limitations or generalizations of research outcomes two factors should be considered. The first relates to the study’s external validity as the respondents were selected by convenience so may not be an accurate representation of the population of community pharmacy LP members. A second weakness the endogenous nature of LP meaning that already loyal customers have a higher tendency for engaging in a LP. This phenomenon may artificially enhance the effects of program loyalty on store loyalty.

FIRM AGE AND FIRM PERFORMANCE: A LITERATURE REVIEW

Rossi, Matteo

University of Sannio, Italy

ABSTRACT

Purpose – In the last thirty years the link between firm age and performance has fascinated a lot of scholars. The debate on this topic have produced mixed results, which resulted in extensive economics debate, albeit without a systemic vision. As a result, the firm age literature has not yet developed a paradigm and the purpose of this paper is to present a review of the existing literature.

Design/methodology/approach – Author carried out a review of literature on firm age and performance.

Originality/value – Since 1990 there has been a major attention on firm age and firm performance. To address this important topic paper presents here a review of literature, starting to a simple question: age benefits performance?

Keywords: firm age, longevity, firm performance, old firms, new firms.

INTRODUCTION

In biology, aging is a process related with a decline in the physical functioning of a body, such as the capability to remember, move, and hear (Loderer and Waelchli, 2010). It is interesting to know whether firms also weaken/strengthen and increase/lose their ability to compete over time, and to know why that happens.

Early empirical work on firm dynamics looked at firm size but not firm age. The seminal work by Gibrat (1931) led to interest in the firm size distribution (FSD) (e.g. Hart and Prais, 1956; Simon and Bonini, 1958) and also in the relationship between firm size and growth rate (e.g. Hall, 1987; Hart and Oulton, 1996). However, later on interest in firm age began to grow, as some studies included age as an explanatory variable in regressions that investigate differences in firm performance. Nevertheless the relevance of age to firm dynamics has attracted comparatively little attention (Stinchcombe, 1965; Dunne, Roberts, and Samuelson, 1989; Singh and Lumsden, 1990; Brüderl and Schüssler, 1990; Barron, West, and Hannan, 1994; Caves, 1988; Hannan, 1998, Hannan, Pólos, and Carroll, 2003a, b), except in the management literature. <<The prior belief would seem to be that age benefits performance. For one thing, firms learn about their abilities and about how to do things better as they get older. For another,
the available empirical evidence shows that life expectancy increases with age, and that better firms survive. There are, however, reasons to disagree (Loderer and Waelchli, 2009: 4).

The paper is organized as follows. Next section outlines a literature review on firm age and firm performance, and finally paper presents the conclusions and managerial implications.

**FIRM AGE AND PERFORMANCE: A LITERATURE REVIEW**

The relationship between firm age and survival has been investigated by a growing number of scholars (Evans, 1987a,b; Fariñas and Moreno, 2000; Mata and Portugal, 2004; Bartelsman et al., 2005), but the results have not been clear-cut.

An early contribution coined the term “liability of newness” to describe how young organizations face higher risks of failure (Stinchcombe, 1965). More recently, however, authors have referred to the “liability of adolescence” (Bruderl and Schussler, 1990; Fichman and Levinthal, 1991).

For Bruderl and Schussler (1990) it’s possible to distinguish two periods of an organizational life cycle. In an early phase, referred to as adolescence, death risks are low, because decision makers are monitoring performance, postponing judgment about success or failure. Meanwhile, organizations often live on a stock of initial resources. In a later phase, initial monitoring has ended and organizations are subject to the usual risks of failure (Bruderl and Schussler, 1990: 530).

Fichman and Levinthal (1991) develop a research on liability of adolescence that explain why firms face an initial honeymoon period in which they are buffered from sudden exit by their initial stock of resources.

It’s possible to underline two different vision in the organization evolution of firms: the first one suggests that old and large organizations become increasingly dominant over their environment, the second one suggests that as organizations age they become less able to respond to new challenges.

Barron et al. (1994) investigate which of these visions best characterizes the evolution of state-chartered credit unions in New York City from 1914 through 1990 by analysing the effects of organizational age, size, and population density on rates of organizational failure and growth. The authors find evidence that old and small institutions are more likely to fail, while young and small organizations have the highest growth rates (Barron et al., 1994: 381). They identify “liabilities of senescence and obsolescence” according to with older firms are expected to face higher exit hazards once other influences (such as firm size) are controlled for.

Various studies in the Industrial Organization literature, report that life expectancy increases with age (Dunne et al., 1989), and better firms survive (Baker and Kennedy 2002). Hopenhayn (1992) shows that, under plausible assumptions, older firms enjoy higher profits and value. The general thrust of the literature on the survival of firms has taken two directions. One starts from the process of
learning by doing and examines the impact of learning on survival firms (Jovanovic, 1982). He affirms that the longer a firm remains in the market, the more it learns about its true costs and its relative efficiency and the less likely it is to fail.

An alternative, complementary approach is reflected in the work of Gort and Klepper (1982). They view variations in survival as consequences of changes in the rate and character of technological change as an industry evolves over the life cycle of its principal products. This approach is confirmed and extended by Jovanovic and MacDonald (1994a).

Also other studies sustain this point of view. In fact, there is ample empirical support for the proposition that survival and age have a positive relation. Dunne et al. (1989), using Census of Manufactures data for sixteen years (1972-87), find a positive relation between firm age and survival throughout the observed age range. Baldwin and Gorecki (1991) examine entry in Canadian manufacturing industries in the 1970-81 period and find high mortality among entrants. Audretsch (1991) analyse the experience of 11,000 manufacturing firms over a ten year period; he reaches a similar conclusion about the relation of age and survival.

Hopenhayn (1992) develops a dynamic stochastic model for a competitive industry. «The paper extends long-run industry equilibrium theory to account for entry, exit, and heterogeneity in the size and growth rate of firms» (Hopenhayn, 1992: 1127). Paper results show that, under acceptable assumptions, mature firms realize higher profits and value.

Baker and Kennedy (2002) realize a study builds on research from both finance and industrial organization and is consistent with a Schumpeterian view of economic development. «The death of old firms and the subsequent birth of new ones thus greatly hastens economic development. Death by takeover allows a target firm’s management to redeploy the assets of the disappearing firm; death by bankruptcy and liquidation often puts those assets into the market for reallocation to new managers» (Baker and Kennedy, 2002: 351).

Two studies that underline why age could impair performance are Hannan and Freeman (1984) and Leonard-Barton (1992). For these scholars there are different reasons why age could harm performance. In fact they soffirme their attention on the organizational rigidities and inertia. In their perspective age can have adverse effects on performance also because of the organizational rigidities and inertia it brings about and because it impairs the ability of firms to perceive valuable signals. This conduct often makes sense, because it helps firms focus on their core skills and raise reliability and accountability (Hannan and Freeman, 1984). Codification makes it hard to recognize, accept, and implement change when doing so would be appropriate. Also age reduces flexibility and discourages change. At the same time, whatever learning benefits the firm can capture in its established lines of
business, they probably decline over time. As pointed out above, the stock of learning might increase at a decreasing rate. Overall, older firms could therefore lose their competitive edge.

More recently, other researchers have analysed the role age plays in the performance of surviving firms (Calvo, 2006; Garnsey et al., 2006; Stam and Wennberg, 2009).

Calvo has investigated age effects by focusing specifically on samples of young firms. In his article he tests Gibrat’s Law for small, young and innovating Spanish firms: <<All the results reject Gibrat’s law and support the proposition that small firms have grown larger. Additionally, the results show that old firms grow less than young ones, and innovating activity – both process and product – is a strong positive factor in the firm’s survival and its employment growth>> (Calvo, 2006: 117).

Garnsey et al. (2006) explore processes and paths of new firms growth. They <<find that new firm growth is non-linear and prone to interruptions and setbacks to an extent overlooked in the literature. From the model of development used, five propositions are drawn concerning measurable features of new firms’ growth paths; these relate to patterns of survival, continuousness of growth, turning points, reversals and cumulative growth>> (Garnsey et al., 2006: 1).

Another important analysis on the role age plays in the performance of surviving firms was conducted by Stam and Wennberg (2009). They present empirical evidence on the effects of research and development (R&D) on new product development, interfirm alliances and employment growth during the early life course of firms. <<The main finding of this study is that R&D plays several roles during the early life course of high-tech as well as high-growth firms. The effect of initial R&D on firm growth seems to be through increasing levels of interfirm alliances in the first post-entry years. R&D efforts enable the exploitation of external knowledge>> (Stam and Wennberg, 2009: 85).

Coad (2010) studies the processes of firm growth by applying a vector autoregression model to longitudinal panel data on French manufacturing firms. He observes the coevolution of key variables such as growth of employment, sales, gross operating surplus, and labour productivity growth. <<Preliminary results suggest that employment growth is succeeded by the growth of sales, which in turn is followed by growth of profits. Generally speaking, however, growth of profits is not followed by much employment growth or sales growth. Quantile regressions highlight some asymmetries between negative-growth and fast-growth firms>> (Coad, 2010: 1677).

Other scholars (Cabral and Mata, 2003; Angelini and Generale, 2008; Cirillo, 2010) have tracked the evolution of the firm size distribution overtime, for cohorts of ageing firms.

Using a comprehensive data set of Portuguese manufacturing firms, Cabral and Mata, (2003) show that the firm size distribution is significantly right-skewed, evolving over time toward a lognormal distribution. <<Past conventional wisdom has held that expected firm growth rates are independent of size (Gibrat’s Law), and that the firm size distribution is stable and approximately lognormal. Recent
empirical evidence, however, shows that the first of these facts does not hold when considering more complete data sets than those used in the past. In this paper, we show that the second fact a lognormal distribution of firm size also fails to hold in more complete data sets>> (Cabral and Mata, 2003: 1083). Their paper document two stylized facts about the firm size dimension: the distribution of young firms is very skewed to the right (most of the mass is on small firms); and the skewness tends to diminish monotonically with firm age (the distribution of older firms is more symmetric than that of young firms). Their paper presents a simple theoretical model in which financial constraints determine the observed FSD evolution, and provides supporting empirical evidence. Starting from this article Angelini and Generale (2008) focus the attention on the evolution of firm size distribution. They develop a study based on a sample containing survey-based measures of financial constraints for Italian firms. Main results are: <<Our main results, based on a sample containing survey-based measures of financial constraints for Italian firms, can be summarized as follows. First, the negative link between financial constraints and firm size is confirmed: firms that declare to be constrained are on average smaller than those that do not. Second, when narrow definitions of financial constraints are adopted, such constraints seem to be a real problem for a small minority of firms. Third, financial constraint problems are found to be relatively more frequent among very young firms, those up to six years of age, but not enough to alter the previous two conclusions>> (Angelini and Generale, 2008: 435-437). Cabra and Mata contribution inspire also Cirillo’s research (2010). In fact, he realises a similar analysis with Italian firms using the CEBI database, also considering firms’ growth rates. Other research has focused on differences in performance and behaviour across firms of different ages. For example, it has been suggested that the age of a firm is positively related to its productivity levels: <<In our sample of long-lived large firms, we find that differences in the mix of workers across businesses are significantly related to differences in productivity levels across businesses, but there is little discernible relationship between changes in productivity and changes in worker mix>> (Haltiwanger et al., 1999: 97).

Brown and Medoff (2003) investigate the relationship between how long an employer has been in business (firm age) and wages. They find that firms that have been in business longer pay higher wages: <<Another interesting (though, given the size of our sample, somewhat tentative) conclusion is that the relationship between firm age and wages is not monotonic. Wages fall as firm age increases, but this relationship appears to be reversed among older firms>> (Brown and Medoff, 2003: 694). The seniority rules in the organization was studied by Loderer and Waelchli (2009). In many firms, under a seniority principle, employees who have been with the organization longer have benefits at the expense of rookie employees. Whatever the reason for their existence and acceptance within the organization, seniority rules in compensation can provide inadequate incentives for managers to
perform. If so, the performance of older firms could deteriorate with the age of the organization (Loderer and Waelchli, 2009: 7).

A relation between firm age and performance could also be induced by the age and tenure of the managers within the organization. Finkelstein and Hambrick (1990) underline three different reasons why older managers could be responsible of organizational inertia:

1. "as individuals spend time in an organization, and particularly as they succeed and climb the organization's hierarchy, they become convinced of the wisdom of the organization's ways" (Finkelstein and Hambrick, 1990: 486),

2. "Related to the effects tenure has on commitment to the status quo are those it has on risk taking. At one level, commitment derives from certain "psychological risks" of change" (Finkelstein and Hambrick, 1990: 487), and

3. "Finally, tenure tends to restrict information processing. Over time, organization members develop habits, establish "customary" information sources, and rely more and more on past experience instead of on new stimuli" (Finkelstein and Hambrick, 1990: 487).

Bartelsman et al. (2005) realize a comparative analysis of firm demographics and survival in OECD countries. "While average firm size differs across countries, due to both sectoral specialization and within-sector characteristics, we find similar degrees of firm churning across countries. In most of them, about 20% of firms enter and exit most markets every year; and about 20–40% of entering firms fail within the first 2 years of life. However, post-entry growth of successful entrants is much higher in the USA than in Europe, which may be indicative of barriers to firm growth as opposed to barriers to entry" (Bartelsman et al., 2005: 365).

An interesting research was developed by Bellone et al. (2008). They examine market selection – in French manufacturing in the nineties – along the firm life cycle. This article "argues that the determinants of firm survival have different effects depending on firm age. Results show that exiting firms display low levels of profitability and productivity. This selection process is more severe for young firms because industry structures favour the survival of mature firms" (Bellone et al., 2008: 753).

Firm life cycle, obsolescence and firm’s original endowments are main topics of two important studies developed by Agarwal and Gort (1996, 2002). They report evidence that hazard rates initially fall and then rebound as firms get older. The authors see survival as the trade-off between obsolescence of a firm’s original endowments, on the one hand, and net investments and learning-by-doing, on the other. Eventually, the increase in endowments falls below the obsolescence rate. This could be explained with two reasons:
- the first one is that the stock of learning increases at a decreasing rate (important lessons are learned first and there is only a finite stock of information to be learned about a technology);
- the second one is that the adaptability of old endowments diminishes and investment opportunities in new technology shrink as the product market ages.

In 1996, they examine entry, exit and the survival of firms in terms of evolutionary changes in the market from the first introduction of a product to maturity of the market. Agarwal and Gort (1996) show the key role that the evolutionary stage of the product cycle plays in determining entry, exit and survival rates of firms: 
"Entry rates appear to be affected profoundly by stage-related changes in both the rate of technical advance and the form that innovations take. Exit is determined largely by stage-related changes in the intensity of competition. Survival rates reflect both market and individual firm attributes. The role of market attributes, once again related to the stage of the product cycle, is reflected initially in rising hazard rates for early entrants in new markets. The power of market attributes is also reflected in the higher survival rates for new entrants than for incumbents for high-technology products" (Agarwal and Gort, 1996: 497).

In 2002, Agarwal and Gort starting from a simple question: "What is it, other than random shocks, that determines the probability of survival for a firm in a given market?" (Agarwal and Gort, 2002: 184), analyse Firm Life Cycles and Firm Survival. They show that "firm survival is crucially dependent on both the product and the firm life cycles. With regard to the firm life cycle, there appear to be two spans of time over which hazard rates decline. The decline continues until the obsolescence of initial endowments finally raises hazard rates... The relation of survival to age of the firm is not simply an empirically observed regularity, but follows an endogenously determined path predicted by the life cycle of the firm. The result that technology intensive industries are associated with higher hazard rates is explained by the faster obsolescence of initial endowments in such industries" (Agarwal and Gort, 2002: 190).

Huergo and Jaumandreu (2004a,b) have investigated how probability of innovation and productivity growth, change across the firm age distribution. In the first article they looks at the probability of introducing innovations by manufacturing firms at different stages of their lives. Their results show that "the probability of innovating widely varies by activity, and that small size per se broadly reduces the probability of innovation, but also that entrant firms tend to present the highest probability of innovation while the oldest firms tend to show lower innovative probabilities" (Huergo and Jaumandreu, 2004a: 193). In a second article authors looks directly at the impact of firms’ age and (process) innovations on productivity growth. They found "that firms enter the market experiencing high productivity growth and that above-average growth rates tend to last for many years, but also that productivity growth of surviving firms converges. Process innovations at
some point then lead to extra productivity growth, which also tends to persist somewhat attenuated for a number of years>> (Huergo and Jaumandreu, 2004b: 541).

Autio et al. (2000) observe that ‘born global’ firms, experience faster growth in international sales than their older counterparts. They interpret this finding as evidence that younger firms are better able to develop export capabilities because they are better able to learn how to succeed in uncertain environments. <<The central contributions of this study include the introduction of the concept of “learning advantages of newness” and a confirmation of the usefulness of knowledge-based and learning views for understanding international expansion issues. We proposed that as firms get older, they develop learning impediments that hamper their ability to successfully grow in new environments and that the relative flexibility of newer firms allows them to rapidly learn the competencies necessary to pursue continued growth in foreign markets>> (Autio et al., 2000: 919).

Berger and Udell (2005) analyse the source of small business finance, and how capital structure varies with firm size and age. They identify some notable qualitative differences between the financing of small business in different age (infants, adolescent, middle-aged, old): <<We identify four different source of equity and nine different sources of debt, and show how the capital structure changes with the size and age of the firm>> (Berger and Udell, 2005: 50).

Similarly, Reid (2003) tracks small businesses in their first few years after inception and observes that the debt ratio decreases over time. He expounded a dynamic theory of the small firm <<assuming entrepreneurs maximise business value over a finite time horizon>>. He conducts a research on thirty-five key financial variables for one hundred and fifty new small business starts over a three year period after inception. Principal results are: <<(a) Steady growth of output (sales), including some phases of consolidation, (b) Steady growth of capital, as measured by fixed assets, (c) Sensitivity of debt (observable also through gearing) to the interest rate on long-term debt, (d) Absence or deferral of dividend payments, (e) Retiral of debt when sales are consolidated. This could be attributed to a cheap equity regime, (f) Increase in debt when sales are rising. This could be attributed to a cheap debt regime, (g) Arguably a sensitivity of equity (observable also through gearing) to the relative costs of debt and equity>> (Reid, 2003: 283).

An interesting research was conducted by Coad et al. (2010). They analyse the firm performance related to firm age between 1998 and 2006, for Spanish manufacturing firms. They begin their work with a simple question: do firms deteriorate with age (like milk) or do they improve with age (like wine)? <<In this paper we found evidence supporting both the milk hypothesis and the wine hypothesis. As evidence that firms improve with age, we found that ageing firms experience rising levels of productivity, profits, larger size, lower debt ratios, and higher equity ratios. Furthermore, older firms are better able to convert sales growth into subsequent growth of profits and productivity.
On the other hand, we also found evidence that firm performance deteriorates with age. Older firms have lower expected growth rates of sales, profits and productivity, they have lower profitability levels (when other variables are controlled for), and also that they appear to be less capable to convert employment growth into growth of sales, profits and productivity. Analysis of the growth rate distributions for different age groups shows that older firms are less likely to experience fast growth, while they are just as likely as younger firms to experience rapid decline>> (Coad et al., 2010: 26). Furthermore their results that younger firms are more successful at converting employment growth into growth of sales, profits, and productivity. Meanwhile, older firms look to do better at converting sales growth into growth of profits and productivity.

The analysis of literature review shows that there isn’t an unique point of view on relationship between longevity and performance. This brief literature review has shown that, although progress has been made in our understanding of how firm age affects firm performance, there are still many opportunities remaining for improving our understanding of how firm behaviour changes as firms grow older.

**CONCLUSIONS**

Although firm age has attracted the attention of a big number of scholars, results have often been mixed. The complexity of the phenomenon is attested to by the fragmentation of the literature, which has prevented the formulation of a general theory on this topic. Most of the existing researches has been empirical work.

These considerations are equally valid for the relation between firm age and firm performance. The large part of studies are focused generically on firm performance, only a little part of these studies are focused on financial performances.

The heterogeneity of scholarly contributions in this field is also related to the difficulty of defining the subject of investigation: firm age can be studied refering to young firm or old firm. Also on performance the analysis can be conducted on innovation performances, organizational performances, financial performances, or other performances. However, all these considerations can explain only partially the excessive fragmentation of the literature. Naturally, literature fragmentation is not limited to the field of firm age and performance, but in this field it provides a clear opportunity for progress. To take advantage of this opportunity, however, it is necessary to conduct a comparison of the various themes, methods of investigation, and data used. Only in this way will it be possible to explore in depth this topic, which remains controversial as far as methodology, objectives, and results are concerned because of its extreme complexity.

The Future of Entrepreneurship

EXPLORING CONTINUITY OF CARE IN INTEGRATED HEALTH CARE SETTINGS

Rudawska, Iga
Faculty of Economics and Management, University of Szczecin, Szczecin, Poland

ABSTRACT
Continuity of care is considered to be an important feature of high quality health care. It is a wide-ranging concept, that encompasses several different aspects of health care. However, it is not often evaluated explicitly, because of the lack of suitable measurement instruments. Therefore, the purpose of this paper is to identify chronic patients’ experiences and values associated to continuity in care. In order to accomplish this purpose a single focus group interview with 12 chronic ill patients has been carried. Collected responses were analysed thematically and grouped into dimensions of continuity of care. As a result of the study, eight dimensions of experienced continuity of care were identified: patients’ involvement, decision-making support, cross-boundary continuity, coordination of activities, communication with the patient, problem solving, availability, and patient-centeredness. This study develops a patient-based framework for evaluating continuity of care. Is also identifies key transition points with problems of lack of continuity.

This paper is part of the research project financed by National Science Centre in Poland (No. 2012/05/B/HS/02213).

Keywords: relationship management, quality indicators, patients’ experience, health care, qualitative study

INTRODUCTION
Health care is becoming more patient-centred and, as a result, the experience of users of care and evaluation of their experience are considered seriously, and used to evaluate the delivery of care (Vrijhoef et al., 2009; Wagner et al., 2005). There is considerable amount of literature about patient satisfaction and experience (Linder-Pelz, 1982; Pascoe, 1993), but it is not clear how to appropriate the instruments are to measure patient experience with care in integrated health care settings. The issue becomes even more important when, quality and satisfaction tools validated by health plans are implemented as a marketing instrument. This is especially the case in current policies towards the integration of health care in Poland.
Integration of care is defined by the WHO as “bringing together inputs, delivery, management and organization of services related to diagnosis, treatment, care, rehabilitation and health promotion wherein integration is regarded as a means to improve the services in relation to access, quality, user satisfaction and efficiency” (Gröne and Garcia-Barbero, 2001). Considering patients’ perspective in this integrated care approach, a measurement instrument is needed to appropriately evaluate the experience of chronically ill people.

Continuity of care is considered to be an important feature of high quality integrated health care. It is a wide-ranging concept, that encompasses several different aspects of health care. There is evidence that continuity of care is linked with greater patient satisfaction (Schers et al., 2005; Mechanic, 2004). However, it is not often evaluated explicitly, because of the lack of suitable measurement instruments. Therefore, the purpose of this paper is to identify chronic patients’ experiences and values associated to continuity in care. The study has been based on the research project sponsored by the National Science Centre in Poland (No. 2012/05/B/HS/02213).

THEORETICAL FRAMEWORK

The term of continuity of patient care appears in numerous discussions as a fundamental aim of integrating the process of health care service provision in Europe (Antunes and Moreira, 2011). In turn, patient satisfaction is a reflection of the problems occurring during a service provision process. Any loopholes in the process coordination, be it between service providers themselves, or between patients and care providers, can thus be treated as threats to continuity of patient care, which impacts on the achieved treatment results (Weinberg et al., 2007). In the context of integrated health care, continuity of patient care is understood as a qualitative dimension concerning seamlessness of health care process provision. The legacy that the 1990’s left behind is the perception of continuity of care from the patient’s perspective, as the patient’s experience of a coordinated and seamless progress/development of care (Cowie et al., 2009).

Currently, researchers use multi-dimensional models to describe the discussed concept. One such model is Haggerty’s team interpretation, treating continuity of care as a combination of (Haggerty, 2003):

- informational continuity – ability of a service provider, from the patient’s perspective, to take the right decisions based on sufficient information source regarding patient’s medical history;
- management continuity – ability of a service provider/network of service providers, from the patient’s perspective, to establish a cohesive care management plan;
- relational continuity – ability of a service provider, from the patient’s perspective, to continue the provision of care by medical professionals the patient is familiar with.
What is crucial in this interpretation for further consideration is adding long-term relations to continuity as well as concentrating on an individual patient and his/her needs. In turn, concentration on an individual patient lies close to the concept of patient/client-oriented care, and more broadly to human-oriented care (Kodner, 2003).

In this paper we adopt multi-dimensional concept of continuity established by G.K. Freeman (Freeman et al., 2003). He defined continuity of care as experiencing a coordinated and smooth sequence of health services by patients. In order to achieve it, according to G. Freeman (Freeman et al., 2003), a health care system needs to feature:

- continuity of information – ensuring information transfer following the patient in the system,
- cross-boundary and team continuity – ensuring effective communication between professionals and services and with patients,
- flexible continuity – ensuring adjustments to patient’s needs over time,
- longitudinal continuity – minimizing the number of physicians treating a given patient in a given health care unit (such as family physician practice),
- relational continuity – assigning one or more individuals with whom the patient can establish and maintain a relationship in the therapeutic process.

What has emerged clearly from above discussion of defining continuity of care is that there is still considerable conceptual and empirical debate surrounding this issue. Based on empirical findings and the conceptual development of the continuity of care concept, continuity of care understood as service quality indicator is now often believed to be he antecedent of patients’ satisfaction (Kasper et al., 1999; Schneider and White, 2004). Approached from our proposed vantage point, the measurement of continuity of care would be thus about a perception (this is what I observe), perhaps relative to expectations; the measurement of patient satisfaction would be about an evaluation (this is what I feel).

Purpose and Method

The main purpose of this paper is to identify chronic patients’ experiences and values associated to continuity in care. To accomplish it a qualitative study was carried out. The qualitative study comprised of a single focus group interview (FGI) conducted in the form of an open discussion with 12 patients suffering from a chronic condition, who may be treated as informants. The procedure of the focus group interview followed the guidelines set forth for that type of study (Krueger, 1994).

The study was guided by two research questions:

- what variables do patients perceive to be significant in the continuity of care?,
- how can the isolated elements be grouped in order to establish a model of evaluating patient care quality in the respect of continuity of care?
Potential participants of the patients’ panel were intentionally selected through a community interview. The criteria of participants’ selection for the focus group interview were as follows: the patient is an adult, the patient suffers from a chronic medical condition - on account of a chronic illness the patient has frequent (over 7 times a year) contact with the health care system, the patient is able to participate in a meeting lasting approximately 2 hours.

An analysis of transcripts of the gathered material allowed identifying 56 comments defining patients’ needs, feelings, preferences and experiences in respect of health care in chronic conditions. Subsequently, the statements were entered into ATLAS.ti software program for management of qualitative study data. Preliminary analysis involved encoding the comments from the transcript of the FGI. Then the author assigned the encoded comments to several central categories by applying Strauss’ and Corbin’s method of comparison in pairs (Glaser and Strauss, 2009). The names of sets were identified on the basis of the literature of the subject dedicated to integrated health care. Their understanding and interpretation were also submitted to discussion with patients during the plenary panel.

RESULTS

The qualitative study comprised of a focus group interview (FGI) conducted in the form of an open discussion with patients suffering from a chronic condition, who may be treated as informants. Tables 1, 2, 3, and 4 show the patients’ characteristics.

Table 5. Central categories and their detailed dimensions of continuity of care delivered to chronically ill patients identified in the FGI.

Source: own research.

Most of the indicators (central categories) identified above, such as patient involvement, decision-making support, problem resolution, communication with the patient, activities organization and coordination, flexibility and availability refer to the process of service provision to patients with...
chronic conditions. The remaining ones, i.e. ensuring continuity in its various dimensions, focus on the patient, are of structural nature.

DISCUSSION AND FINDINGS

Analysing the results obtained through the FGI, it is worth emphasizing that the chronically ill patients themselves rarely use terms such as: “continuity of care”, “coordination”, “therapy planning”, “integration of care” to describe their experience, needs and feelings with regard to systematic use of health services. Furthermore, assigning a particular experience or need expressed in a patient’s comment to one of the eight main categories was problematic at times on account of mutual interrelation of individual dimensions and possibility of illustrating a number of various sub-categories with a single comment at the same time.

Patients described their previous experience with health care system in regard to continuity as the care they have been receiving since the diagnosis identifying their chronic condition was made. They were referring to check-ups and systematically repeated tests related to a given chronic disease. Some declared that “patients need to demand the tests from their doctors,” (P5, female, 64 years old) “the patient more often than not reminds the doctor of it,” (P4, female, 63 years old) or they articulated their needs for such tests by saying: “a family doctor should recommend that a patient of a particular age (i.e. an elderly patient) take the tests that the patient is entitled to on account of his/her age” (P8, female, 73 years old). The respondents were also referring to the significance of continuity of care by demonstrating their concern resulting from deficiency of care:

- “intervals between visits [are] 9, 10 months – I believe that it is too rarely. It is hard to refer to a doctor you see so seldom as your attending physician”(P1, male, 41 years old).

High frequency of visits and consultations resulting from exacerbation of condition symptoms seems to be the parameter describing the quality of care delivered to a chronically ill patient. This component acquires particular significance at the start of therapy, where the patient’s ignorance is confronted with the need to deal with a chronic condition on an everyday basis. Hence patients particularly value extensive consultations with numerous specialists at initial episodes of chronic diseases, which improve their understanding of the circumstance they are in. The effect of such an attitude to the service recipient, which in fact constitutes an indicator of the focus on the patient (patient in the centre), involves closer adherence to therapy regime and acceptance of any related inconveniences.

Experience of longitudinal continuity may be perceived as a pre-condition necessary for the establishment of relational continuity. Patients appreciate the situations in which they are recognizable. It builds their sense of security, which may contribute to achieving better therapeutic
results: “when I come to the outpatient clinic, everyone knows me, greets me and it is very pleasing” (P3, male, 81 years old).

The element of continuity of care in chronic diseases that the patients value is the possibility of obtaining assistance/consultation in emergencies. Flexible continuity also manifests itself through service provider’s readiness to change appointment dates suitably to patients’ preferences. Here is an account of one of the FGI’s participants describing her experience in this regard: “they have their schedules, and I have mine” (P12, female, 45 years old). A majority of patients experience lack of flexible continuity, especially with respect to the waiting time for scheduled consultations and delays in making appointments. Here are several responses recorded during the FGI:
- “there was no problem with issuing a referral, however there was one with actually making use of it” (P2, female, 39 years old).

Communication and its continuity appear to be another important component of patient care in patient-service provider relation. The quality of communication is chiefly defined as the ability to listen to the other party and to convey a certain amount of information, including on the course of therapy, any possible adverse effects, any risk related to a procedure, expected results. Patients’ experience in this respect related during the group interview was rather negative. The following patients’ accounts are symptomatic:
- “I had no idea that [if] I take Eutyrox it will cause diabetes. No one has informed me of that” (P6, female, 70 years old),
- “The doctor just whizzed by” (P9, female, 69 years old).

The element of continuity of care in chronic diseases that the patients value is the possibility of obtaining assistance/consultation in emergencies. Since the needs of chronically ill patients change over time, they find it important that medical professionals react quickly enough. Such situations may thus be related to flexible continuity, which involves adaptation of a service to the patients’ needs. One such option is provision of services by medical professionals selected by the patient. Here is how one of the interview participants perceives the phenomenon: “I have a regular cardiologist, however not the one I would have liked, but the one I had to choose” (P7, female, 62 years old).

Erosion of continuity may occur at any stage of the process of patient care provision, although the greatest risk of it appearing exists in the course of a patient’s transfer from one stage of health care to another, for instance from primary health care to secondary specialist outpatient care, from outpatient care to hospital-based setting, or from hospital-based setting to primary care. Transition of the patient from one stage of care to another typically involves exacerbation of symptoms; it necessitates more extensive diagnostics or a hospital discharge. All of the above situations generate a different demand for health care and different intensity of health care services consumption. The loopholes in the
continuity of health care may therefore result in delays of care provision, misinformation, or problems of a communicative nature. Consequently, the patient may seek alternative solution to the medical problem, disregard medical advice, or even decide to discontinue treatment.

**ORIGINALITY / VALUE**

The results of the conducted qualitative study constitute an important premise for the construction of a methodological tool, comprising a set of indicators describing continuity of care from the perspective of the patient. Identification of the dimensions of health care continuity over chronically ill patients in Polish health care settings as well as identification of any possible loopholes in such continuity constitutes a vital cognitive value of this stage of methodological procedure.

The developed framework provides an assessment of various dimensions of continuity of care that is applicable to integrated health care settings in Poland but could also serve as a reference list for evaluating continuity of care in other settings. Assessment of these aspects of patients’ experience is of particular value in relation to chronic disease management in Poland and other countries that face aging societies.

As does most research, this study has certain limitations that affect the interpretation of the results and simultaneously suggest directions for further research. The study was conducted in a single region (West Pomerania). Including other regions of Poland might have identified contextual boundaries to the findings. Moreover, the study is comprised of a single FGI and could have benefited from including additional ones.

Additional research related to continuity of care could examine whether some quality dimensions are common across health care levels (primary care, out-patient specialist care, in-patient care) or relevant only for particular level (in that case out-patient). It could also refine the assessment tool referring perceived quality of integrated health care programmes. Finally, further research could address the value of different integrated delivery schemes and overall success of the patient relationship management.

Despite above mentioned limitations, the findings reported in this paper offer a better understanding of relationship marketing in health care settings.

CUSTOMER PERCEIVED VALUE IN BUSINESS-TO-BUSINESS MARKETING: IS IT STILL ENOUGH?
Russo, Ivan; Confente, Ilenia; Cobelli, Nicola
Department of Business Administration, The University of Verona, Verona, Italy

ABSTRACT
This study provides a better understanding of business relationships between suppliers and industrial buyers. Based on previous research models, we explored the value drivers that industrial buyers, in particular health professionals, perceived as relevant in the hearing-aid distribution industry. A nationwide online survey was the principal data-collection instrument. Based on previous research, we evaluated several drivers measuring the perceived value delivered by hearing-aid suppliers, including offer quality, service elements, relationship costs and personal interaction. We researched not only the customer value (CV) but also the ability of the suppliers to anticipate customer needs. The results demonstrated that other than offer quality, none of these drivers represents or affects the customer value. However, these drivers were found to affect the anticipation of customer needs, surprisingly demonstrating that succeeding in each of the drivers reflects the anticipation of customer needs but not customer value.

Keywords: customer value, supplier–customer relationships, customer value anticipation, business-to-business relationship, health-care professionals, industrial marketing, service quality, service marketing, switching cost, vendor evaluation.

INTRODUCTION
Research investigating customers’ perceptions of value generally distinguishes between ‘desired value’ (what the customer desires to receive) and ‘received value’ (the customer’s perceptions about the value delivered). This perspective can be termed ‘value for the customer’. Woodruff (1997) found that many apparently different definitions were actually in fact similar, generally involving a trade-off between what the customer receives, identified as quality, benefits, worth, or utilities, and what they give in exchange. Ulaga and Eggert (2006) highlighted that in business-to-business (B2B) contexts, relationship benefits seem to represent a strong potential for differentiation in key-supplier relationships. According to Flint et al. (2002), the implication for managers is that they should attempt to understand the whole-value hierarchy of their offering and avoid defining it strictly by its attributes. Buyer value can be created at any point in the chain by
making the buyer either more effective in their markets or more efficient in their operations. The notion of value has been at the heart of marketing for nearly 20 years (Ritter and Walter, 2012). Before communicating the value offering to customers, companies should translate the value-delivery strategy into detailed actions and activities to be undertaken at any level of the organisation. Customer value has been found to measure some important aspects that are generally not included in customer-satisfaction measurements. Measuring customer value can be of particular help in today’s changing and highly competitive business environment because it allows a comparison between alternative offerings and provides data that is useful for understanding and anticipating customers’ current and future needs.

Research has demonstrated that deeper insight into the sources of value creation can create superior value propositions in a competitive global marketplace (Anderson and Narus, 2008; Blocker et al., 2011; Heinonen et al., 2013). Business marketers have cited the need for greater understanding of the drivers of customer value as a priority (Anderson and Narus, 2008).

Our study focused on customers’ perceived value (CV) defined as the customers’ perceived trade-off between benefits and sacrifices within relationships (Lam et al., 2004; Ulaga and Eggert, 2006; Blocker et al., 2011; Prior, 2013) and customer value anticipation (CVA) in B2B contexts. This study aimed at contributing to the debate on customer value by advancing its exploration and considering the business relationship between suppliers and industrial buyers (their customers) of health-care services. We tested different constructs (offer quality, personal interaction, service support, supplier know-how, relationship costs, operational costs) to measure the value perception delivered by their suppliers.

The research model of this study is based on the need for more research on measuring the constructs of the B2B context in different complex industry sectors (Bloker et al., 2011; Lindgreen et al., 2004; Ritter and Walter, 2012; Prior, 2013). The choice of health-care services was due to the increasing attention of scholars on such services in the B2B context (Crié and Chebat, 2012). This study attempts to address the calls of previous research to provide new insight into customer value through a national online survey conducted in Italy exploring customers’ value perceptions and CVA at the retailer level in the hearing-solutions industry in Italy.

LITERATURE

Most recent B2B literature (Walter et al., 2001; Nyaga et al., 2010; Lepak et al., 2007; Ritter and Walter, 2012) simply defines customer value as a trade-off between benefits and sacrifices perceived by the customer in a supplier’s offering. The benefits and sacrifices perceived, and hence the perception of value, may vary depending on the changes in the importance given to the distinct elements of the
offering. Ulaga and Eggert (2006) found that in B2B contexts, relationship benefits seem to represent a strong potential for differentiation in the key-supplier relationship. Core differentiators would be represented by service support and the interpersonal interaction with the supplier firm and, secondarily, by the supplier firm’s expertise and ability to improve a customer’s time to market. Relationship value in the B2B context is a dynamic process, and the nature and characteristics of the value sought are constantly changing across different supply-chain members (Cannon and Homburg, 2001).

Research on building customer-value theory in B2B contexts has focused on defining the concept of customer value (Woodruff, 1997), measuring its antecedents (Ulaga and Eggert, 2006), and exploring value creation as a process (Grönroos, 2008) that dynamically unfolds in relationships (Blocker and Flint, 2007; Flint et al., 2002). Smith and Colgate (2007) identified four major categories of value that organisations can create: functional/instrumental value, experiential/hedonic value, symbolic/expressive value, and cost/sacrifice value.

Blocker et al. (2011) tested the role of proactive customer orientation for creating customer value in global markets. Their hypothesis was based on the consideration that the higher complexity of a multinational context makes it more difficult for customers to evaluate providers and fosters feelings related to ambiguity and risk. Understanding the customer’s value chain and their end values and goals in the value hierarchy is very useful in discovering the customer’s unexpressed and latent needs. Another interesting area of research is the CVA dimension that is defined as the kind of capability that can be seen as a dynamic capability (Eisenhardt and Martin, 2000), itself an extension of the resource-based view of the firm, and more specifically, a specific kind of dynamic capability termed an ‘operant resource’ (Flint et al., 2011). There are several operations of business using different customer-value constructs (Smith and Colgate, 2007; Russo and Cardinali, 2012). However, there remains a gap in the literature on the role anticipation on the part of the supplier plays in contributing to the level of value customers perceive suppliers help to create.

Blocker et al. (2011) model provided a relevant contribution to the literature by exploring the antecedents of customer value, for example, standards. Starting from this point, our study allowed us to compare the value constructs measured by Blocker et al. (2011) as applied to the ICT industry context. We particularly considered the following key factors: the offer quality, personal interaction with employees, support services, supplier’s know-how and relational/transactional costs from the perspective of specialized hearing-aid buyers. Table 1 lists the hypothesis of our study.

Our study concentrated on the analysis of the manner in which value is perceived and evaluated by specialist buyers, particularly focusing on the supplier’s ability to deliver value, as well as its capability to anticipate value.

**METHODS**

*Data sample and collection*

Data collection focused on perceived value drivers with business customers working in the health-care...
service. We surveyed key informants (i.e. acting industrial buyers) about their perception of the value delivered by their main provider of hearing aids.

The health industry was selected for several reasons. The complexity of the products in the market has driven final customer to search for advice from trustworthy and reliable sources. As such, this industry represents a good example of a changing marketing-channel structure that has emerging actors who have adopted a larger role in the manufacturer/end customer exchange.

We used the following participant inclusion criteria:

- professionals enabled by law to resell hearing aids
- professionals running a business at the retail level
- professionals with the freedom of choice of their suppliers
- voluntary participation.

We identified 840 health-care professionals belonging to the Italian Audiologists Association (ANA) who met the criteria. However, 340 were excluded because they were actors of structured hearing-aid distribution chains (i.e. franchisees) and therefore, did not meet the freedom of choice criterion. We selected 500 health-care professionals who met the criteria and sent them an email with a link to a secure web survey. This survey was completed after a pre-test that refined the structure of the survey, and the items involved in the survey.

In September 2013, a pilot survey was administered on a convenience sample of 20 participants. The principal finding was that respondents, due to their cultural background, found it difficult to understand some of the items of the original version of the questionnaire. Consequently, it was necessary to refine the structure of the survey and of some of the items listed in the survey, by providing examples for each item proposed.

Questions were divided into two main sections. Section A surveyed the demographic characteristics of respondents and the information about the relationship with their key hearing-aid supplier (e.g. experience with hearing-aid products, length of the partnership, total expenditure with their main supplier). Section B surveyed customer-value constructs adopting a 1–7 Likert scale (i.e. 1=highly dissatisfied to 7=highly satisfied).

We received 317 complete responses; all respondents were audiologists running a small business in the Italian hearing-aid distribution industry. They purchased products/services from hearing-aid suppliers and they were enabled by law to resell them to hearing-impaired end users. They were the key players in the transaction between suppliers and the hearing-impaired end users, evaluating the best value offering and advising the final customers.

On average, respondents had been working for several years within this industry and seventeen per cent had experience of ‘more than 30 years’. Thirty-eight per cent declared having long-term
experience in the industry (i.e. from 20 to 30 years), and 39 per cent indicated having ‘from 10 to 20 years’ experience. Only six per cent had fewer than 10 years’ experience within the industry.

Forty-three per cent of the participants declared having a long-term relationship of more than 7 years with their main supplier, and 40 per cent of respondents declared 70 per cent to 90 per cent of their total expenditure was to their main supplier. At least 20 per cent stated they received 90 per cent of their products from their main supplier.

Data analysis

Respondents were asked to evaluate the main value drivers provided their main hearing-aid supplier. This included the main value drivers highlighted by previous research in other B2B industries (Blocker, 2011; Blocker et al., 2011; Ulaga and Eggert, 2006, Lam et al., 2004). In addition, the construct of CVA was added to the model, first as a predictor, then as the dependant variable (Flint et al., 2011).

Table 6. Customer-value constructs

Data were analysed through descriptive statistics, a correlation analysis among the main constructs and a linear regression model exploring the effect of the value drivers on the overall customer value and on the CVA perceived by business customers. The following regression models were elaborated using R software:

a)  
Customer _Value_ = β₀ + β₁ Offer Quality + β₂ Personal interaction + β₃ Service support + β₄ Supplier know how + β₅ Acquisition costs + β₆ Switching costs + β₇ Customer value anticipation + ε
b) 

**Customer Value Anticipation =**

\[ \beta_0 + \beta_1 \text{Offer Quality} + \beta_2 \text{Personal interaction} + \beta_3 \text{Service support} + \beta_4 \text{Supplier know-how} + \beta_5 \text{Acquisition costs} + \beta_6 \text{Switching costs} + \beta_7 \text{Customer value} + \epsilon \]

To assess reliability, we assessed the internal consistencies. The value of the normalised Cronbach’s alpha was 0.72, in line with the minimum value of 0.7 suggested by Cortina (1993). The value of Cronbach’s alpha for each item was also examined to verify whether the exclusion of any items could improve the overall alpha.

**FINDINGS**

Table 3 presents the main correlations among the drivers, highlighting a strong and positive correlation between the different value drivers (e.g. personal interaction, service support, supplier know-how) with the evaluation of the ability of hearing-aid suppliers to anticipate customers’ needs (i.e. CVA).

*Table 7. Correlation of constructs*

The results confirm previous research that has found value creation to be a dynamic process (Grönroos, 2008), where providers need to identify and anticipate latent needs (Blocker et al., 2011). Very few constructs are connected to customer value. For example, this is seen in offer quality having a positive relationship with overall customer value. Generally, relationship costs and switching costs are not correlated with customer value or CVA.

The first regression analysis focused on the effect of several value-drivers constructs on the overall customer-value perception (Table 4).
The results demonstrate that all these constructs (adopted from previous literature) do not represent or affect the evaluation of customer value apart from the perception of offer quality. However, this result is not the same when considering CVA, the perception and evaluation of which might be the result of business customers’ perception of almost each value-driver construct (Table 5).
In this case, all the value constructs are significant and positively related to CVA. The conclusion is that some customers might come to expect suppliers to anticipate their needs and desires (even if they themselves cannot). As shown by Grönroos (2011), suppliers’ actions can be more effective if they are able to anticipate and provide solutions to unexpressed needs. In addition, relationship costs negatively affect the ability of the main supplier to anticipate customer needs, as the more the customers need to spend and invest to maintain the relationship with the supplier, the less the supplier is able to satisfy their customers’ needs effectively. In such a scenario, competitive advantages can be obtained by suppliers identified by customers as able to match their needs spontaneously with a flexible offer (Prior, 2013).

**IMPLICATIONS**

This study has allowed us to investigate the different constructs of value perceived in the B2B relationship. Further, this study contributes to the B2B marketing and relationship literature about health-care buyers’ (at the retail level) perceived value towards their main suppliers. This study also provides useful implications in the analysis of the manner in which these buyers can affect the value proposition from the supplier in the B2B context, identifying different factors of importance of value drivers, and evaluating the supplier’s ability to deliver value in a specific business context. The relevance of our findings is that CVA capabilities appear to be an operant resource that may offer a competitive business advantage.

This study addresses the need to assess the increasing complexity of understanding the roles (Flint et al., 2011), relationships, and drivers among buyers, suppliers, and other parties in marketing channels (Prior, 2013; Ritter and Walter, 2012).

Our study found that the technical features of the product were of secondary importance. In dealing with their customers, hearing-aid suppliers should move away from concentrating on the technical features of a device to focusing on the provision of support for its successful operation. This implies that suppliers should grant ongoing practical support and service to customers by also anticipating their needs on the basis of their wider and deeper knowledge of the market. We have demonstrated that buyers desire proactive suppliers. CVA capability seems to be a distinguish resource offering potential competitive advantages in competitive sector. From a business-management perspective, the results suggest that effective cooperation between suppliers and specific buyers is required. Improving the cooperation of all these service-network participants is paramount to improving product and services provision to end users.

**CONCLUSION**
Our study confirms the importance of strong cooperation between hearing-aid suppliers and the retailer. The justification of the necessity of this cooperation lies in the fact that retailers do not resell a standard product. Rather, they offer their final clients a personalised solution that includes the device, several fittings, and assistance services. Final clients search for a unique hearing solution and expect the audiologist to be flexible and sympathetic, just as audiologists as retailers expect their suppliers be proactive in offering flexible and anticipating solutions, indirectly matching final clients’ expectations. In sum up, it seems that the value-anticipation process is intrinsic to this market. Further consideration could be given to the possibility of adopting a vertical integration process that would allow the supplier and retailer work in very close contact to ensure their perspective of the offer system is similar.

Our results are limited to aspects of CV and CVA operationalised in a specific business context and our research does not explain how this is done. Future research on CV and CVA could be conceptualised in a more complex manner, particularly focused on understanding how suppliers might effectively anticipate the needs of the customers.

STRUCTURAL CAPITAL IN KNOWLEDGE ECONOMY: GENERAL INSIGHTS

Russo, Giuseppe; Rosa Lombardi; Federica Evangelista
Department of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT
Purpose – The paper aims at analysing the role of structural capital in the current scenario, defining the management and evaluation profiles.
Methodology – The research approach is based on a qualitative methodology with the application of a single method approach. The sources of research are of a secondary type (paper, news, journal open access).
Findings – The findings of research originate from systematization of international literature. The objective is to represent the strong and weak points of the management and economic evaluation profiles of structural capital.
Originality/value – Structural capital favours the circulation of knowledge within a company and stimulates the creation of long term value. In this way, accessibility to company knowledge plays a rather important role if analysed from an internal perspective as well as from an external perspective.

Keywords: structural capital, intellectual capital, management, economic assessment.

INTRODUCTION
In the past decades, international literature (Lev, 1999; Guthrie and Petty, 2000; Stewart, 1997) has actively examined the theme of intellectual capital.
Despite the fact that taxonomy on this theme is varied, the paper analyses the structural capital and its management and assessment profiles. The objective is to offer the academic community and experts in this field with an updated conceptualization on this theme.
So, the objective of the research is in defining the role of structural capital in contemporary organizations (Zanda, 2011). Structural capital can be interpreted by starting with the definition of intellectual capital. Through a qualitative research approach, international literature on this topic is examined, supposing that the creation of long term value is generated by the very best management of structural capital.
The structure of the article is the following. After the introduction, section two analyses the literature related to intellectual capital, structural capital, its management profiles and economic appraisal.
Section three describes the research approach adopted. Section four illustrates the research results. Section five illustrates the final considerations, the limits and future perspectives of the study.

LITERATURE REVIEW

Intellectual Capital in Knowledge Economy

Ever since the Nineties, the attention focused on knowledge has resulted in confirmation of the strategic role of intellectual capital (Petty and Guthrie, 2000; Kaufmann and Schneider, 2004). This immateriality is seen as a range of intangible resources that, if correctly appraised in company management (Darroch, 2005; Du Plessis, 2007), result in an increase in long term company value (Chen et al, 2005).

The OECD (1999) considers intellectual capital as the economic value of two categories of intangible company resources: structural capital (or organizational) and human capital. The structural capital of a company refers to elements such as the characteristics of computer systems and distribution networks; human capital includes internal company resources (personnel) as well as external company resources (customers and suppliers). The definition identifies a specific distinction of the term intellectual capital and intangible resources, often mistakenly used as synonyms.

Peterson and Bjurstrom (1991) highlight another definition of intangible resources. The authors classify company intangibilities into three macro categories: human capital, market capital and confidence capital. Human capital includes a range of qualities that characterize the resources used within the company, such as leadership (Bennis and Nanus, 1985; Bradford and Cohen, 1984; Friedman, 1985; Mintzberg, 1973), motivations, know-how and the ability to achieve the objectives; the capital market identifies the perception that customers have of the company and of its products; finally, confidence capital indicates the opinions as well as the behaviour of company stakeholders with regards to the company, as well as the ability of the company to prove its reliability.

Edvinsson, Saint-Onge and Petrash (Edvinsson and Malone, 1997) have drawn up a model called the Value Platform. It can identify the inter-relations that are important for the creation of value. They identify human capital, organizational capital and customer capital as elements of intellectual capital. Stewart (1999) defines intellectual capital as “all intellectual material – knowledge, intellectual features, experience – that may be made available to create wealth”. According to the author, intellectual capital consists of three conceptual dimensions: human capital, relational capital and structural capital.

Structural capital represents coded and non coded company knowledge, technology, inventions, formal and informal organizational procedures, best practices, patents, databases and Intranet networks.
Structural Capital and Its Management

Structural capital is an expression of the organizational and management aspects of a company; it can be defined through the range of coded and non coded knowledge of the characteristics of a contemporary company.

Sullivan (2000) examines the intellectual activities deriving from the innovations produced by intellectual capital. Intellectual assets include programmes, inventions, processes, databases, methodologies, industrial projects and intellectual property rights (patents, copyrights, brands, trade secrets) on which the company can claim property rights.

As far as Sveiby is concerned (1997) structural capital (or the internal structure) includes a range of patents, models, administrative systems and software created by employees and owned by the organization. Company culture is also included.

Company culture plays a very important role in the development or organizational aspects that can generate, management and maintain intellectual capital within the organization; it includes a range of rules, values and principles that affect the decisions made by company employees.

This generates a dynamic interdependence between human capital and structural capital. The knowledge and skills of each individual play a very important role in the creation of structural capital. Individual knowledge is appraised, diffused among company employees and transformed into action.

The role played by structural capital in the creation of value has resulted in the need for development of its management methods aimed at greater availability of knowledge within the organization (Sánchez et al., 2000).

The increase in this immateriality favours the circulation of knowledge within the company and stimulates the creation of long term value (Teece, 2000; Varian, 2005).

In this way, accessibility to company knowledge plays a very important role if analysed from an internal as well as external perspective.

Starting from the internal perspective, intangible goods require adequate management methods as they are characterized by a high level of dispersion. This characteristic results in the need for collection and coding.

A creative approach to coded knowledge presumes its conceptualisation with regards to the new situation.

The creation of knowledge generates resistance by the holders, who fear that they may lose their prestige and contractual power with regards to the organization. Furthermore, the knowledge of the competitors can be copied and new costs related to use of internal personnel as well as requests for external consultancy may arise.
In order for knowledge to be diffused within the organisation and contribute to the creation of new internal capital, the company must develop:

- a leadership focused on knowledge management initiatives (Alavi and Leidner, 1999; Bollinger and Smith, 2001) that stimulates personnel to favour the exchange of knowledge;
- a culture that encourages the development and use of cognitive capital, also in a modern manner;
- operative systems that favour sharing of the knowledge assets by employees;
- an organizational structure of a reticular type in which individuals are assigned shared values and objectives. This kind of organisational structure allows for the outlining of variable responsibilities, which in turn stimulate individuals towards greater creativeness and dynamism in answering external requests.

Structural capital belongs to the organisation in its entirety. It may be reproduced and made available to each individual (Stewart, 2002; Daum, 2003).

An analysis of accessibility of structural capital involves problems related to knowledge management. The development and creation of new knowledge also requires important investments. Consequently, the demand to protect such knowledge from imitations and embezzlement by others, so that the company may take advantage of the economic benefits deriving from creation of the innovative idea.

The methods of protection that contemporary organizations make use of also include a technical protection and a legal protection.

The technical protection limits access to knowledge developed through access control. Legal protection, however, allows the modern company to legally protect the knowledge developed against improper use by others, that may use them without any right to do so.

Legal or technical protection of structural company capital has two results. It stimulates company investments in terms of research and development but at the same time it limits the diffusion of knowledge and, subsequently, the creation of new knowledge due to the effect of its accumulation.

The Economic Value of Structural Capital

The economic value of structural capital may be estimated through the use of three main approaches: the cost-based approach, the value-based approach and the real option-based approach.

The cost-based approach is based on historical cost and on reproduction cost for an estimate of the economic value of structural capital.

The historical cost includes all costs borne by the company related to invention and application activities of a technology. This method is not easy to apply: many mutual costs borne in the various research centres exist and the total of costs may not adequately represent the value of technology. The cost of reproduction represents all of the costs required for the creation of an element of utility similar
to the technology included in the estimate. The application of this method includes some limits: the
difficult identification of replacement knowledge in terms of utility and the ones available on the
market as well as the uncertainty that the costs borne for the creation of technology may guarantee the
same results.
The value-based approach assesses the future economic benefits that technology can provide to the
profitability of a company. While approaching the estimate, however, two problems arise:
identification of the flow of expected economic benefits, choice of the rate of updating such benefits
and the definition of the life of technology.
The flow of expected economic benefits may derive from future differential profit generated by the
difference between economic benefits achieved before the use of new technology and the economic
benefits that will be achieved by introduction of the same.
In this way, assessment of technology, carried out through updating of the flows of future benefits,
updated at an adequate rate of remuneration for pure capital and risk investment, represents a
theoretical value of general exchange, equal and neutral, that satisfies the seller as well as the buyer.
The exchange value of the technology is represented in the following formula (Zanda et al., 2005):

$$W = \sum_{x=1}^{k} C_s (1+i)^{-i}$$

where:

$W$ is the economic value of technology;

$C_s$ is the flow of competitive benefits or differentials provided by technology to the company in $k$
number of years;

$i$ is the discount rate of benefit flows that takes into consideration risk and remuneration for pure
capital investment.

The value-based approach has been applied by Ferrata (Ferrata, 2007). He estimates the economic
value of base research through the insurance related logic, considering some aspects such as the need
for new knowledge as indicated by demand, conclusion of basic research of the laboratory problems
including in the project, the benefits deriving from the sale of each unit of product following the
development of technology. The assessment of basic research can be represented in the following
formula (Ferrata, 2007):

$$Y = \sum_{x=1}^{t} p_i (\Delta R_r^{t-m}) r^{t-m}$$

where:
Another approach suitable to an estimate of the economic value of structural capital is the real option-based approach. This starts with the doctrine (Amram, 1999, Black and Scholes, 1971) that considers it suitable for the assessment of applied research as the method, characterized by rationality, objectivity and neutrality, can enhance the investments characterized by a high level of uncertainty. The real option is set up as an option related to an investment project.

The problems innate in this method refer to the definition of contractual conditions, to be clarified on each occasions, and compliance of the investment with some characteristics: the value of the investment is affected by contingent values, the uncertainty of the investment results in the need for further information; the possibility of making changes to the strategy underway; flexibility of the investment, the entrepreneur may choose several alternative businesses. As the investment adopts several strategies, it has high growth possibilities.

The assessment process includes several types of real options: development real options, connected with “platform investments” for the implementation of other projects; deferment real options, related to the opportunity of postponing the decision related to further investments for a certain period of time; real flexibility options, typical of research projects in which the final objectives can be easily changed. The real options of abandonment provide the executor with the possibility of interrupting the project within a certain period of time, at advantageous conditions, in the hypothesis in which it is no longer convenient in future investment developments.

Existence of the real options can be empirically proved starting with a preference for investments in research with greater liquidity on the market between two investments with the same characteristics. The approach proposed by Amran and Kulatilaka (1999) articulates the real option model in four phases: definition of the mathematical model according to the characteristics and sources of uncertainty; application of the assessment model of the option (Cox et al., 1979; Black and Scholes, 1972); examination of the results achieved according to the data included in the model; possible
redefinition of the investment according to the re-elaboration of strategies or results that are not in line with expectations of management.

RESEARCH APPROACH

The research approach is based on the qualitative method (Maylor and Blackmon, 2005; Myers, 2013). Research investigates into the topic of structural capital, emphasizing the role undertaken by the latter in the economy of knowledge. Therefore, special attention is given to the following aspects:

- the notion of structural capital;
- the profiles of management and enhancement of structural capital;
- definition of the correct trade-off between accessibility and protection of company structural capital.

The acquisition of data has been carried out using the single-method approach (Yin, 1994). The sources of research are of a secondary nature and have been selected using the following research:

- 20 scientific articles have been selected related to the topics: “intellectual assets”, “knowledge management”, “structural capital” and “real option”;
- 2 databases have been used, 20 scientific articles have been consulted through the EBSCO database, found through research using the word “intellectual capital”; through Google Scholar 10 scientific articles have been consulted using the keyword structural capital;
- several websites, news and open access journals have been consulted.

FINDINGS AND DISCUSSIONS

The results of research are born from an analysis of international literature related to structural capital. Structured knowledge stimulates the accumulation of knowledge inside and outside of the organization that has generated it; they may inspire the creation of new technologies (Choen and Levinthal, 1989) and the formulation of new ideas.

Among the aspects investigated, it can be seen that the traditional methods of social capital assessment are not capable of assessing investments into applied research, enhancing opportunities. The high level of uncertainty in the results of investments makes it difficult to estimate the value of technology (starting with costs necessary to create an equivalent technology of use) and to attribute sure profitability or financial flows to the same.

The real options reply to this requirement, even if their main elements (current price, applicable price, method of execution of the option), in the Option Pricing Model, are not easy to identify.
Another element of reflection is the choice between protection or diffusion of knowledge.

The protection of structural capital offers the organisation the achievement of a leading position in the market and the acquisition of adequate economic returns aimed at covering the costs borne for the creation and development of knowledge.

An excessive level of protection of intellectual property limits access to new knowledge, restricting its accumulation process. Breakage of the balance between old knowledge and new knowledge therefore occurs.

The trade-off between accessibility of structured knowledge and its protection does not have just one solution. The very best solution derives from an analysis of structural capital involved in the protection and the ability of the innovator to take hold of the economic benefits created by it (Tan et al., 2007; Maditinos et al., 2011; Kannan, and Aulbur 2004).

The measure in which new knowledge can be imitated by competitors depends on the simplicity with which technology is understood and communicated. This characteristic is a result of the nature of knowledge (tacit or coded) of the team to lead that the innovator enjoys on the market and the life cycle of structural capital.

Correct management of structural capital requires a connection between the life cycle of technology and management of intellectual property. A universal approach may not be sufficient (Chesbrough, 2006).

The forms of protection of intangible goods are not always successful in playing the role of protection. An example of this is represented by the illegal copies of goods or the possibility of developing goods that are similar to those of the innovator.

This situation results in a reduction in earnings of the original manufacturers/inventors of the goods and an increase in costs borne by them for appeals deriving from the violation or presumed violation of intellectual property.

The solutions proposed for limitation of these phenomenon include granting of open source knowledge. The editorial contents of goods, texts, images, videos and software through specific user licenses are shared by several operators, who can use them and make changes freely.

The use of this form of liberalization for products that are difficult to protect is recommended, as the open source concession of structured knowledge results in a reduction of economic returns of the inventors; the manufacturing companies can compensate the economic losses suffered through the sale of complementary products.

However, if the company owns ideas and patents that are not used because they are not functional for the activity carried out, the trade-off between accessibility and the protection of structural capital may
be mitigated through their transfer (including by means of a license) to companies capable of taking advantage of their potentials (Chesbrough, 2006).

Often companies do not use all of the ideas developed and patented. As far as the company system is concerned, these ideas represent a waste of resources. They are demoralizing for the human resources that have created them and may slow down the flow of innovation.

The license or transfer of part of the structural capital unused allows for diffusion of the knowledge developed and the development of new knowledge to companies capable of capturing the potentials (Rappaport, 1986).

At the same time, the company owning the patent may take advantage of the economic benefits of this technology that, otherwise, would have been worthless.

CONCLUSIONS, LIMITS AND PERSPECTIVES

A lot of literature can be attributed to intellectual capital. The companies that take advantage of internal knowledge for the creation of innovation and of efficient and effective production processes guarantee a position of competitive advantage.

Contemporary companies are rich, vital and competitive when they own a high level of intellectual capital.

In this regard, company performance is seen in its entirety, as the range of results achieved, considering the tangible and intangible elements.

This document has introduced an updated conceptualisation of structural capital to the intangible components, with special reference to management and assessment profiles.

With regards to external management of company knowledge, the trade-off between accessibility of structural capital and its protection has been investigated. The protection of structural capital, on the one hand, guarantees remuneration of investments made to the entrepreneurs; on the other hand it favours the emergence of illegal forms of acquisition of knowledge.

On the contrary, the opening of structured knowledge favours the circulation of new knowledge and has active participation in the creation of further knowledge. In this case, all of the organizations benefit from the economic results of the idea, reducing proceeds for the company that invented it. However, this does not represent a disincentive for the inventor company in creating further investments in terms of knowledge, limiting the development and increase of internal company capital.

Contemporary companies tend to favour the correct balance between sharing and protection. In this regard, the achievement of long term stable results is preferred.
The limits of the article include its theoretical form and the fact that the analysis carried out represents an updated conceptualization of literature, found through the research method previously illustrated. Therefore, future research aims at aims at systematizing the main literature on the topic of structural capital with the objective of providing another qualitative analysis.

GOVERNANCE, ACCOUNTABILITY AND PARTICIPATORY BUDGET
BETWEEN MYTH AND REALITY. THE ITALIAN CASE

Russo, Salvatore
Department of Management, Ca’Foscari University, Italy

ABSTRACT

This paper explores the implications of participatory budget (PB) in Italy, inspired by insights and reflections on public governance, accountability, participation and inclusion of citizens in the local authority expenditure decisions. In particular it focuses on the characteristics of the context in which PB has encountered practical implementation, the way by which it is realized, the most common type of intervention and, finally, the criticalities in the units of analysis. The conclusions give way to considerations on actions still required to promote PB, so that it can really be seen as a tool for improving accountability.

Keywords: Public governance, participatory budget, accountability

INTRODUCTION

In the last twenty years, the public sector has been characterized by innovative processes and managerial tools with new visions and trends (Hood, 1991; Rhodes 1996; Lapsley, 2008). Among these, a logic of participation and citizens involvement has emerged with the aim of diffusing the adoption of new forms of governance and promoting shared decision making. The need to build a system of participating mode of citizenship and collaborative governance appears pressing in order to connect policy effects with both expectations and needs of different social groups by discharging accountability (Newman et al., 2004). This is modifying the conventional rules of democracy, in order to encourage participation, dialogue, consensus and various expressions of interests in those contexts traditionally reserved to the policy maker (Lehtonen, 2006).

If the New Public Management (NPM) has revised the role of the citizen by assimilating it to that of a customer in a “marketized” Public Administration, a new emergent vision makes the citizen an active subject in a process in which the citizen’s role is integrated with government and based on a new vision of the accountability paradigm (Hummels, 1998; King et al. 1998; Goetz and Jenkins, 2001;
Ackermann, 2004). The same concept of public value, in its evolution, has considered the “co-participation” as key-element to pursue public interest (Moore, 1995). Consequently, the very concept of public governance should benefit from the enrichment deriving from the direct involvement of citizens in public decision-making, thus stimulating the activation of accountability processes in which politicians, managers and citizens are fully involved (Bekke et al., 1995). This represents a starting point for new theorizations as well as **multilevel governance** (Rhodes, 1996; Stoker, 1996; Pierre e Stoker, 2000; Irving and Stansbury, 2004; Soma and Vatn, 2010) or **collaborative governance** (Newman et al., 2004; Fung and Wright, 2001; Fung, 2006).

Among the heterogeneous instruments of the participative democracy, undoubtedly, the PB plays an important role both for the impact exercised on society as a whole and for the involvement of several social groups in the resource allocation process. “At the heart of such initiatives is the right to increase councillors’ decision-making, with more localized citizen involvement in determining resource allocations” (Mitlin, 2004:6).

From a review of the literature it is possible to observe that several experiences in those poor areas of the world where the citizens’ involvement in public decision-making is encountered as an useful support for the construction of a priority scale taking into account political needs, social and economic differences (Eberlei, 2001, 2007). These initiatives have also influenced the most industrialized countries with the adaptation of both methods and instruments to the context requirements, so that it is now possible to discuss how this has come about and what the concrete effects are (Ebdon, 2000; Gaventa, 2004; Lehtonen 2006, Sintomer et al., 2008).

In Italy, an increasing number of municipalities have been implementing participatory budgeting, so this may be considered a good starting point for some interpretative reflections and empirical observations. Coherently, this paper explores the relationship between Local Authorities and citizens’ participation, and aims to answer the following questions: 1) what does mean the PB in the evolutionary forms of public governance?; 2) what are the main benefits and criticalities in the PB implementation in the Italian municipalities?

The first section of the paper is dedicated to the concepts of governance, participative and deliberative democracy. The second section is devoted to the instruments mainly used in the implementation of participatory democracy. The third section focuses on the PB. The fourth section examines the case of some Italian municipalities that have initiated experiences of participatory budgeting. Finally, discussion and conclusions.
2. PUBLIC GOVERNANCE, PARTICIPATIVE AND DELIBERATIVE DEMOCRACY

From the point of view of the public management theory that, over the last two decades, has supported changes in both the organization and structure of the public sector, firstly it is possible to observe the ethical dimension that has focused on the relations and integration between administrators and administered. The reforms have sought to transform the culture of public organizations, which includes encouraging employees to think of citizens as customers to be served instead of clients to be managed (Hood, 1991; Osborne and Gaembl, 1992; Saarelainen, 1999).

NPM has paid excessive attention to the possibility of exercising market control rather than democratic control, thus emphasizing the customer role of citizens and reducing their political role (Hood, 1991, Ferlie et al., 1996, Lapsley, 2008). However, what has taken a non-negligible meaning, together with the key principles of effectiveness, efficiency, responsibility and accountability, is the transparency in the action of the public administration. Transparency, in terms of a strong concept of responsibility, is powerfully rooted in the phenomenon of participatory democracy, and can be reached only by providing highly organized tools and means for citizens’ activism in the political process. Transparency is also strongly related to the concept of self-governing, according to which citizens do not have only an impact on the services offered by the public administration but also take part in the production process, firstly as co-decision-makers on “what” and “how” to produce, and secondly as co-producers of the service (Sjöblom 1999:22).

A complementary perspective is provided by the stakeholder theory. It assumes that a company (public or private) has a series of constituent groups depending on the context of the activities in which they operate (Freeman, 1984; Jones and Wicks, 1999). The concept of stakeholders in the public administration assumes a wide meaning compared with private firm, as all the individuals or their social and economic groups are holders of a “stake”, which derives from their role in society (Handley and Howell-Moroney, 2010). Stakeholders are not primarily seen as actors who can influence the organization’s continuity, but as individuals and groups who have a legitimate claim on the organization to participate in the decision-making process simply because they are affected by the organization’s practices, policies and actions (Hummels, 1998:1408). By highlighting the ways for a change through the development of a new administration model based on cooperation, collaboration and integration, this implies an overrun of what is traditionally indicated as a sort of bipolarism that sees citizens and administrators as antagonists. In this regard, the use of the term “co-governance” suggests properly that the borders between state and civil society are vanishing (Goetz and Jenkins, 2001; Ackerman, 2004; Arena, 2006).
In the field of public policy two different paths in this approach are proposed: the method of pressure and the method of comparison (Bobbio, 2002, 2004, 2006). The first, which is related to the expression “participatory democracy”, considers participation as a tool to give a voice to weak social subjects, who are marginalized or traditionally excluded, through social movements or associations. The method of pressure responds to an idea of participatory democracy which is supported by social movements and is reflected in the “participatory budget” experiments carried out in the Latin American countries and, in general, in those countries whose economies are particularly disadvantaged. (Abers, 1998; De Sousa Santos, 1998; Allegretti, 2001; Gret and Sintomer 2002; Harnecker, 2003)

In contrast, the method of comparison, which coincides with deliberative democracy, is based on the assumption that civil society has a pluralist nature. It does mean participation as a comparison of dialogic nature, between citizens which have conflicting ideas, different points of view or opposing interests, in order to draw up common solutions and to find a common ground or, at least, to clarify the terms of the conflict for finding a common ground of action. The relationship is no longer of dualistic type between people and administration, but is rather a multi-voiced dialogue in which the public administration assumes a neutral role and is equal to the other actors (Pellizzoni 2005: 23).

Comparison and co-decision are two crucial moments in validating the deliberative process, which are not longer guided only by elected bodies, but are determined by a majority, built for a specific purpose and therefore, legitimized to choose. The difference between the theory of deliberative democracy and other theories of democracy is consequently locus (Chambers, 2003:308). Deliberative democracy is ‘talk-centric’ not ‘voting-centric’.

The experiences referring to the deliberative democracy theory are based on two essential points: the use of comparison argued and the inclusion of all the interests and points of view that are affected by the social actors. In substance if in the model of participatory democracy the citizens are invited to take part in the debate, by opinions, suggestions and, sometimes, direct claims, in the deliberative model they are directly involved in decision-making process and are able to determine the outcome (Heimans, 2002).

Both models reflect the transition from a traditional view, towards a vision in which the citizens become co-protagonists in the decision-making processes. From a preliminary analysis of studies in the literature of international bodies (World Bank, International Monetary Fund, etc.) on the subject of stakeholder participation in the implementation of the Poverty Reduction Strategy Process (PRS) (Eberlei, 2001, 2007), one can observe a multiple approach in the methods of interaction between politicians and citizens, at the various stages of the political cycle. The degrees of participation, which
are normally considered to be formal, vary and may take the form of the following actions: 1) sharing of information; 2) consultation, 3) joint decision; 4) partnership; 5) control.

Contributions from policy studies (OECD, 2001) consider that engaging citizens in policy making is a core element of good governance, and contributes to building public trust in government, raising the quality of democracy and strengthening civic capacity. Because of its direct interest in the problem at stake, this study deserves a more detailed analysis. The OECD’s vision of citizens’ involvement encompasses three levels: a) access to information; b) Consultation; c) Active participation.

It acknowledges equal standing for citizens in setting the agenda, proposing policy options and shaping the policy dialogue, although the responsibility for the final decision or policy formulation rests with government” (OECD 2001: 23; Gramberger, 2001).

Accountability represents one of the ten guiding principle proposed by OECD (2001) for engaging citizens with policy making (the other are Commitment, Rights, Clarity, Time, Objectivity, Resources, Co-ordination, Evaluation, Active citizenship).

On the one hand, this marks the abandonment of the conventional interpretations of the public government supported by the concept of power coming from the authority (typical of the traditional public administration) and, on the other hand, it introduces the power of communication as a source of an innovative idea of co-shared administration. This is based essentially on the principles both of “subsidiarity” and “organisational autonomy”, since the first legitimates the autonomous citizens’ initiative in the alliance with the public administration to solve problems of general interest; the second, in its relational dimension, needs to establish in a pluralist society equal relations between the different areas of interests, both public and private (Arena, 2006: 82; Bourgon 2007).

That assertion allows to sustain a sequential logic, by starting from the concept of co-shared democracy, passing through the phase of participatory democracy or dialogical, and coming to that is commonly reported as the democracy of stakeholders. In this last paradigm, public governance represents the phenomenon to which politicians, citizens and interest groups contribute in an active way. On this innovative concept of governance, accountability and transparency of public action exercise a strong influence (Dwyer, 2005). In fact, accountability does not exercise its strength only in the operational phase of reporting from the decision-maker to the citizen, but it is inevitably a substantial component of reinforcement in the opening behavior that the decision-maker implements, by making citizens sharing the same decisions and putting them in a position to evaluate the effectiveness and the outcome of policies, both ex ante (programming ) and ex post (control of results).

We talk in this way about social accountability defined by the World Bank (2005:1) as “an approach towards building accountability that relies on civic engagement, i.e., in which it is ordinary citizens and/or civil society organizations who participate directly or indirectly in exacting accountability”.

The Future of Entrepreneurship
3. PARTICIPATORY BUDGET AS AN INSTRUMENT OF CO-SHARED LOCAL GOVERNANCE

Among the different forms that currently seem develop the paradigm of deliberative democracy, the PB approach, in which interests of the participants intersect and integrate, seems to have reached a certain degree of success, keeping its original features and treating predefined arguments on which decisions have to be made (Gret and Sintomer, 2002; Bobbio, 2002). In this approach, citizens and/or organizations in civil society are actors in the decision-making process together with the representative bodies.

PB allows the citizens of an area (neighbourhood, regeneration or local authority area) to participate in the allocation of part of the local Council’s or other statutory agency’s (health services, police) available financial resources. PB aims to increase transparency, accountability, understanding and social inclusion in local government affairs. PB applies to a varying amount of the local Council’s budget and the actual process is developed to suit local circumstances (PB Tool kit, 2008:4).

PB directly involves local people in making decisions on local spending and priorities for a defined public budget. PB processes can be defined by geographical area (whether that refers to a neighbourhood or to a larger area) or by theme. This means engaging residents and community groups in discussions and voting on spending priorities, making spending proposals, and voting on them, as well as giving local people a role in the scrutiny and monitoring of processes and results, in order to inform subsequent PB decisions.

The legitimacy of the power to manage the common resources of the collectivity derives from the mandate granted by the citizens to the elected representatives. However, in this historic phase, which is characterized by a scarcity of public resources together with the presence of strong social pressures, the complicated and complex system of rules determines conditions that undermine the representative mechanisms. So, it generates a deep split between both consensus and/or political opportunity and the capacity of the public administration to respond to the real needs of the community. The PB as a tool mainly used in areas of the world that are particularly depressed economically are characterized by strong social contrasts, seems to be a solution in western countries to improve the performance of public services and face to the fiscal stress (Ebdon and Franklin, 2006).

The main factors inspiring the PB approach in Latin America have reference to: scarcity of resources, fiscal decentralization, need for transparency in policy and resource allocation (Roberto, 1996; Heimans, 2002; Cabannes, 2004; Afonso, 2006). PB is not a document but a pervasive process engaging all those who have an interest in public administration. The reference to local government is frequently mentioned as a cause of the various bottom-up experiences that have been increasing in
many countries. PB does not reverse the roles in local government but creates a synergy in the knowledge of public interest between politicians and citizens.

Many contributions to the literature tend to highlight two different profiles in the PB approach. “The experiences fall between simple consultation with citizens, whereby the executive and legislative branches retain all the power, and deliberative experiences, in which the decisions of PB councilors have real power and are endorsed by the municipal council” (Cabannes, 2004:28; cfr. Heimans, 2002). The implementation of PB would demonstrate that the democratic and transparent administration of the financial resources is a powerful and very appropriate way to avoid corruption or deviation of the public funds, generating popular public participation.

The first PB experience was launched by the workers’ party in 1989 in Porto Alegre, capital of the Brazilian State of Rio Grande do Sul. The workers’ aim was to fight serious problems related to power concentration, resource waste, political affairs and corruption. That experience led the way for similar experiences all over the world (Abers, 1998; De Sousa Santos, 1998; Allegretti, 2001; Gret and Sintomer, 2002; Harnecker, 2003). Over 300 Brazilian municipalities adopted PB between 1989 and 2004, and cities in at least 30 other countries also have adopted PB (Wampler and Avritzer, 2006; Cabannes, 2004). The phenomenon has also caught on in Europe, where there are different rules in the various countries because PB does not imply a definition of rules but is a philosophy permeating the process of elaboration. More than 300 municipalities in countries such as Venezuela, Canada, Spain, France and Chile, and the UK have already used PB. In the UK, for example, experiences of PB began to catch on in the cities of Salford and Manchester in 2000. A 2008 report by the PB unit - a project of the charity Church Action (Participatory budgeting in the UK: values, principles & standards, 2008) – claims that 22 pilot projects have led to some form of participatory budget. The objective was to ensure that by 2012 each local authority area should have a PB.

Aspects of the PB Process

The process of PB generally requires citizens to be engaged in decision-making. It extends the succession of stages of the cycle annual budget formulation and approval which afford investments and projects to be allocated to the emerging local needs. In the participation process for the budget formulation, procedures and activities are not scheduled and, on the basis of indications from the experiences already gained in different countries, it is possible to design a sort of prototype of the process articulation as follows:

- preparation of feasibility studies to support the evaluation of the investments or projects;
- preparation of a proposal in the areas concerning the participatory process;
- monitoring process in the budget approval;
- monitoring in the budget management with specific reference to the priorities;
- monitoring the provision process (competitive tenders, contracting);
- monitoring services provision for the public works.

In these activities it is reasonable to think about the joint attention paid by both public administration and citizens to budget performance.

PB involves citizens and political forces in collaboration, therefore it has the prerogative to include in the resource allocation process those who traditionally are not involved in political decisions. There are really no universal rules about the application of PB. The methodologies may vary depending on the local authority and its requirements. So there are rules which determine the percentage amount of resources to entrust to the citizens’ decisions.

Given the citizens’ involvement, PB creates opportunities for greater effectiveness in the distribution of public funds and increases social cohesion. According to the advocates of PB, this implies a certain amount of advantages (Heimans, 2002:10) as citizens’ empowerment and promotion of public learning; democratization of macroeconomic policy; integration among different social groups; co-shared economic and social growth.

Certainly PB is not a “consolation prize” for citizens but a decision-making instrument that is able to rebuild a relationship of trust between institutions and citizens.

At the same time the risks is that “people may view PB as just another bandwagon” while it is a new way of planning and budgeting. Therefore, the risk is that may be a mystification of the participation tool (Wampler and Avritzer, 2006). Other risks are: a potential impact on fiscal discipline of the increased demands on governments through participation; an erosion of the legitimacy of established democratic institutions, such as parliament, in favour of less accountable civil society organizations; an escalation of conflict over resource allocation and distribution among participating social groups; the “capture” of participatory processes by local elites, by the most vocal constituencies or by those with vested interests. In this sense the PB represents a tool for modernising local governance and activating the community to improve the local public services.

4. THE ITALIAN WAY TOWARDS CITIZENS’ PARTICIPATION

As in most European States – according to the OECD report 2009 - also in Italy, in the last few years there has been the introduction of some form of citizen participation, in particular in the local authorities (mostly the Municipalities). There are also experiences that have launched a regional form of participation, by codifying methods and tools. This is the emblematic case of the Tuscany Region, which approved a law in 2007 whose content promotes regional instruments of deliberative democracy (Floridia, 2008; OECD 2009). Other experiments are in progress in other regions (Lazio Region, Emilia-Romagna Region).
In general, the administration of the local authority recalls closely the concepts of participatory democracy and deliberative democracy and particularly the small-size municipalities are more involved than others.

The advent of ITC and the start of e-Governance projects simplify the accessibility to the public administration by the use of web sites (for example online forums, wikis) and speed up the dialogue between public and institutions. It is the substance of the policies and the immediate tangibility of their effects to involve citizens by pushing them towards forms of organization where they can take an active part in the dialogue and be present in the choices relating to resource allocation.

Further the recent reforms in Italy have introduced new figures of responsibility and have embedded in the public rules principles of efficiency, effectiveness and economy that did not previously feature in any law. This change has strongly contributed to move their culture towards the dissemination of a management logic based on results, at the top of which there is the principle of accountability of the organizational units in the achievement of the objectives.

The new managerial approach has meant a revolution in terms of prevailing strategic objectives, using the human resources as the main source of competitive advantage, in a management process which sees the co-sharing of objectives within the organization and a tendency to continuous improvement.

The challenge of the programming and control (P&C) system consists precisely in its capacity for adaptation and depends upon the elasticity of response to the context of reference. The P&C system, which constitutes a cross-operating system on which the different stages of activities and translation of political intent depend, is thus a fertile ground for allowing citizens participate in decision-making.

It enables a cyclical transition from strategy to programming, management and reporting, by providing in each of these steps appropriate monitoring activities and forms of control. So doing programming extends in a horizontal span and is able to predict what will happen at every step.

In this succession forms of interaction between politicians and citizens, public officials and citizens may take place in a traditional way (for example with forms of questioning in municipal councils) or with innovative instruments. The implementation of P&C systems requires not only a certain degree of innovation in the instruments used, but also a change at the organizational level, through the involvement of all the operational units and the coordination of all activities. This implies a redefinition of the strategies and a change of management in a results-oriented logic. In addition, the complexity of the control system impacts on the quality of the external information, by improving the exercise of responsibilities and the guarantee of greater transparency that comes from the public (Garlatti e Pezzani, 2000; Hinna, 2004; Pezzani, 2005).

The need to comply with accountability, considered one of the main factors underpinning the path of deliberative democracy, is part of that change in the culture of public administrations which considers
as the aspects of economy as the ethical aspects of management, by opening the way for new reflections on the perspective for improving the performance of the local authority. This is a tool that allows for comparison and the sharing of common objectives, and can be seen also as an instrument for the reduction of potential social conflict. The information function seeks to give account to the citizens of the use of public resources and the accomplishment of strategic objectives. At the same time, it meets the requirements for greater accountability from the internal offices, thus playing a strong motivational role.

In the light of this recent innovation the role and the meaning of PB should be interpreted by considering it as a dynamic process in which politicians, civil servants and citizens are involved. That surely may influence P&C system and the way politicians and public manager discharge accountability. The degree of inclusiveness, the importance of participation in decision-making processes, their extension, the channels of communication and the evaluation mechanisms are unquestionably the keys to a successful PB experience. Further PB may also support the local authority in facing the difficulties and constraints currently present in the system of public finance.

5. THE RESEARCH

On the basis of the theoretical conditions highlighted a research has set up by formulating a series of questions that have engaged the development of an empirical survey focused on a set of Italian municipalities that have acquired considerable experience on the participatory budget. The survey was carried out by paying attention to the selection of municipalities, either well-documented in the literature or for having placed the project details on their own websites. The keyword inserted for their detection was “participatory budget”, assuming that the term in itself requires a continuous relationship with the citizens, so that occurs mainly by using channels such as Internet. The sample is based on only 11 local authorities (provinces capital and municipalities) that between 2009 and 2011 have collaborated with the research team. The first item has aimed to explore the ways in which PB has been implemented and how it was structured. Secondly, we asked “whether” and “to what extent” the PB is able to affect the programming process. Finally, “if” the PB is really able to ensure greater accountability of public decision-makers and managers in respect of citizens’ expectations, and can it ensure a long-term sustainability. That was followed identifying contacts with the responsible units for participatory budget. Subsequently, a questionnaire containing 20 questions was designed with reference to the following modules: characteristics of context; mode of citizens’ involvement; process execution; aims and achievements.

It should be specified that, in Italy, the PB has been implemented, especially in the municipalities located in the central and northern regions since 2000, except for some experience such as
Grottammare (Ascoli Piceno), which started in the early 1990s. In different local contexts, however, the PB was often put out of action or replaced by social reporting, another tool for discharging accountability. This last, while encouraging the citizens’ contribution in the phase of countercheck and audit, seems to limit the concrete incisiveness of the citizens’ participation. In some cases, the interviewees themselves made it possible to further deepen the experience, especially from the point of view of the setting-up of the PB process, to highlight the differences characterizing the practices of the citizen participation model.

The aim of the research was to find out the tangible benefits of the PB experience and include the stories of participatory democracy within local policies that imply the creation of deliberative arenas, debates and dialogues, by which the representative democracy mechanisms can be innovated. This was also to verify if these experiences really operate for the benefit of the majority of the population and what direction is followed by the PB process in any interviewed municipality.

**Findings**

The procedures of the PB are very different and depend on the context where the process is implemented. The experiences are almost all addressed towards progressive experiments that have highlighted the strong points of the PB. These consist mainly in adjusting its rules so that the process can always adapt to the characteristics of individuals, by reestablishing the relationships among the different institutions and groups of the civil society. It is considered a tool of aggregation and permits the abandonment of old forms of policy for guaranteeing a transparent administration in the choices made by local governments. In fact they are different experiences even if, through the networks for the exchange, as in the case of the URBAL program, it is to build a consciousness of mutual benefit (between public administration and civil society). Moreover, in a few years, some experiences are trying to formalize the process, in order to make sure a certain continuity and to develop particular skills in the field but, above all, with aim of practicing more and more a “legitimizing policy”, after the electoral vote. In this perspective the PB is used as an instrument putting in relationship the representative democracy with some moments of deliberative democracy. The observed experiences reveal that the joining element is the location of some fundamental steps in the construction of PB, such as: emerging needs, priority voting (all participants brainstorm a list of ideas), verification of feasibility and insertion of specific expenses in the annual budget. In detail, every Municipality interviewed has been trying to adapt the process to the demands and characteristics of the participants and to what the administration would really like to achieve.

**Characteristics of context**

Since the municipalities were chosen exclusively on the basis of the indispensable condition that they had completed a PB experience, their characteristics are heterogeneous as regards the number of
The Future of Entrepreneurship

inhabitants and the composition of the population. Firstly, the data about PB come from small and medium-sized municipalities (54%) and only 5 (46%) are provincial capitals. The geographical area mostly concerned is North Italy.

Almost all of the municipalities are run by centre-left governments, under which it has been chosen to apply the participatory budgets. Only in two cases (Grottammare and Isola Vicentina), the government is represented by a civic list, composed of individuals not belonging to any political party.

In the majority of cases, the option of introducing the PB has been a political choice, proposal by the Mayor and town counselors, while presenting the electoral program. The Italian case that inspired the PB in most cases (Castel Maggiore, Isola Vicentina, Ivrea, Modena and Vimercate), is Pieve Emanuele (MI), which was one of the first Italian municipalities to implement a participatory process, thus maturing a large experience in this field. Among the international experiences, the inspiring PB case is that of Porto Alegre, as well as those of the Latin America (Bel Horizonte-Capoliveri), with which a relationship of interchange and cooperation, within the European programs, has been initiated.

It is important to highlight the role that some municipalities such as Modena, Ivrea and Castel Maggiore have had in spreading the experience. Through seminars and conferences, they have been proposed moments of comparison among local authorities which have activated or would like implement experiences of participative democracy. The aim was to make known, analyze and compare the various experiences, so as to develop cooperation between institutions and improve and disseminate the forms of participation. In some cases, in which a large resonance to the communication was given for empowering participation (for example in Ivrea), the Municipality has joined the work table “URP of URP”1, on the topic “communicate the participation”, by focusing attention on the aspects of communication in the context where citizens are included in the decision-making process. Through a comparison of analogous experiences there has been an attempt to deepen the role that communication plays in the PB implementation, both in general and in relation to the different phases that characterize the co-shared processes.

In all the cases surveyed the PB path has been formalized as a new management tool by means of specific regulations. This is subjective compared to every experience, but only in two towns attention has been paid to including the PB in the “accounting rules” of the institution. Collaborations with other local authorities have been initiated especially for spreading the experience and for a comparison, but it is not a very common practice (only four municipalities out of 11). In most cases, a special office is activated to manage the PB steps and it’s properly called “Participation Office”. In the

1 URP in Italy is Ufficio Relazioni con il Pubblico, “Public relations Office” in the public administration
other cases it is related to the financial service, or social policies service. Rarely, the PB management is entrusted with the competence of the Communication Office, or of the Financial services.

Rules for citizens’ involvement

The main forms of citizens’ involvement for bringing them closer to the public administration choices are questionnaires during the periodical quarter assemblies, the institution of a participation office, posting flyers, the continuous updating of the municipal web site. In particular, in Ivrea a “Suggestions” box was opened, as well as an area on the website for sending proposals, comments and suggestions on how to achieve and improve the process of citizen participation; in Bergamo some citizens were interviewed and small focus groups (with a maximum of ten people) were organized; Reggio Emilia distributed a tabloid newspaper describing the various stages of the process to all families resident in the quarter where the PB was implemented. The instruments used to involve citizens frequently are: the grid of priorities and votes, the operational plan, as an instrument of resources allocation to each project, questionnaires and polls, postcards, modules of proposals.

In the municipalities of Bergamo, Castel Maggiore, Grottammare, Isola Vicentina, Ivrea, Reggio Emilia and Udine the administration has launched training courses for citizens and public officials, to improve the approach to this experience and to ensure the proper conduct of the participatory process. These training sessions are carried out, in particular, during assemblies. In particular, in Udine, initial conferences have been activated to find out more about the experiences of Brazilian city of Santa Maria Rio Grande do Sul, with which Udine has established a cooperation inside the URBAL project. In Ivrea pilot meetings were organized with the trade union representatives and four associations which play an important role in the economic context of the territory in order to discuss the experience of past and on-going participation.

As regards the age groups of the participating population is not very accurate since some of the municipalities have not carried out a monitoring process. On average, it is possible to say that the most involved residents fall into the 45-55 age band. Since this is especially important if one considers that young people, the most important resource to enable the process to really affect a cultural change in programming, is not very present.

Themes and criticalities of the PB process

In the municipalities of Bergamo, Castel Maggiore, Ivrea and Udine, the participatory process takes place over the whole year, from January to December. In other municipalities, instead, the process is concentrated in the second half of the year, after the formal approval of the budget. The subjects discussed are chosen according to the citizens’ preferences and their emerging needs in Grottammare, Isola Vicentina, Ivrea, Reggio Emilia and Udine. Instead in Bergamo, Castel Maggiore, Cinisello Balsamo, Modena and Vimercate the themes that will be discussed on assembly and among those in
which will vote the proposals, shall be selected by the mayor and by the Municipal Council, and are more the themes of culture and leisure, public works and environment. In the Municipality of Trento the themes are chosen by a committee, formed by the mayor, three assessors and by the representatives of constituencies. On the one hand, this choice is made to avoid the citizens’ proposals going beyond both the competences and resources of the administration, but on the other hand it may be so restrictive that it discourages the public from proposing measures to implement. For that reason, even if the proposals are not present in the predefined areas of intervention and therefore they cannot be discussed in this occasion, a list of them will still reported to the competent bodies. Generally to assign predefined themes for addressing participation offers a clear point of reference and reassures the citizenship, above all in the preliminary approach to PB.

In Castel Maggiore there are two types of assemblies: public assemblies, open to all, and thematic assemblies, reserved for associations and organisations in the area, concerning education, the regional economy, the nonprofit sector, the area of production and commerce, trade organizations and unions. Also the number of assemblies carried out is rather variable but in any event, beyond the assemblies for listing the emerging needs, other assemblies are made to for getting a feedback information about what the administration has actually done for implementing feasible actions.

In the quarters of Ivrea, Isola Vicentina and Modena the costs linked to the PB procedure were attributed to a specific item inherent respectively to services for the participation. In all the other experiences analyzed, specific items and relative costs are divided according to department, with the other items of the various sectors concerned.

In Modena the proposals emerging from the assemblies are subject to an examination by means of tables of territorial comparison, so the administration may assess the financial and technical feasibility. In Reggio Emilia, as well as in Grottammare, the evaluation is entrusted in the technical work tables, involving all competent leaders in the field, the project team, the representatives of each quarter and the citizens’ delegates appointed during the meetings. The work table shall submit to control the proposals on the basis of two factors, the technical and legal feasibility and the compatibility of the acts already adopted; finally, estimates costs and time of implementation.

The area of co-decision on which major projects were achieved, as in most of the experience examined, is that of Culture and leisure (73%); immediately after Public Works (64%), Welfare (64%), Environment (55%), Safety (37%) Mobility (37%). This shows how the PB may be used for investment in infrastructure even if it requires at the same time a great capacity for alternatives selection that often the respondents/participants do not have. As a result, with reference to these areas the BP represents a test bench of legitimization and a guide in the choices that the political bodies have to translate in action.
With reference to the PB investigated, firstly it emerged the need to clarify what the areas of competence were with reference to the proposed measures, mistakenly charged to other institutions. Contextually politicians (and their delegates) had to dissolve the initial mistrust, by launching issues and stimulating participation. In fact in the most recent experience, several obstacles depend on the difficulties encountered to explain how the PB proposals have to be submitted, where these are required. Often this does not lead to a successful path, because who is confused in the face of topics and issues that require specific skills, in addition to the common civic sense, tends to abandon the assembly of PB.

Secondly, there are some communication difficulties due also to the gap between citizens and administrations which often are not able to get people involved in participation. For example in the municipality of Isola Vicentina, the project of BP was used as a tool to build a scenario on the future of the town, by defining a comprehensive a long run plan in which the actions indicated by citizens in assemblies were consistent with the project, in order to save resources and to maximize the social utility. The PB experience has not been successful and the citizenship has not seen the implementation of those projects as compared to the initial forecasts.

In the town of Modena instead the assemblies have been spread in a non-homogeneous manner, without continuity and in this case, emphasis was placed on the low quality of the proposals that were viewed as a sort of “shopping list”. Consequently, in 2008, the PB was suspended because of problems in the constituencies, from both political and organizational points of view. The principal obstacle seems to be derived from the representative bodies that have seen in PB a sort of field invasion, that is an obstacle in the regular flow of the decision-making process. Without abandoning the way to participation, that is always seen as an opportunity, the administrators tried to address the technical difficulties deriving from the non-inclusion of PB in the procedures of the municipality and chosen to give priority to targeted interventions. From 2010 onwards is in fact proposed a new path focused on municipal areas that tries to involve those social groups, in particular young people and migrants, which traditionally have been very active in public life. The process hesitate in the detection and selection of projects considered to be worthy and compatible with their inclusion in the programming documents to be translated into financial expenses in annual budget. Among the cases analyzed, just two experiences have been completely abandoned (Cinisello Balsamo and Isola Vicentina)

6. CONCLUSIONS

If from the theoretical point of view the BP gets its justification in the development of democratic dynamic and represents the most allusive procedure of deliberative democracy, from the operative
point of view, the PB approach represents a method to joint to P&C system. Its performance depends on the tenacity and the conviction by which it is implemented and, especially, on the impact that may have internally and externally. Unlike management tools that are only recently introduced into the culture of the local government, the BP imposes itself as a path to have a multifunctional impact, acting in several directions. First of all, it acts on the political level and consequently on both the economic-financial and management levels. From a political perspective the PB gives its greater contribution to enable the decisions on investment policy in the territory and on themes of common interest where the citizens’ preferences are mediated by the policy capacity of government, the involvement of political bodies and the reaction of the public personnel responsible for the coordination of all activities related to the PB process.

This may create a strong strategic value to advantage of the investment planning and in particular, of the annual budget operation. At the economic and financial level the PB enables citizens to take part in the resources allocation process, although in most cases it reserves to citizens only a residual investment quota, or even anchored to a so specific investment, that the procedure doesn’t appear convincing and convenient compared to the arising overheads costs. In this regard, the participation, by its very nature, affects only investment expenses for the benefit of the entire community (i.e. public works etc.). Besides, it would be questionable to imagine that co-decisions may relate to the resources allocation regarding the current expenditure. In such a way the PB becomes an instrument for ensuring significance to the financial management of the investments, according to the principles of transparency, efficiency and effectiveness.

From the organizational and management perspective the process has repercussions both inside and outside the institution. Internally, the PB is an instrument for innovation that primarily affects the economic-financial area and communications. Both areas should coordinate for the execution of the operations of citizens’ involvement and document completion, bringing it up only in the last phase of approval by political body. This requires the deployment of a set of skills that are able to support the high flow of information generated and the interaction of the main players in the various phases of participation. No activation of a proper process may involve the approach’s failure. It’s no accident that successful PB experiences are largely the result of a path undertaken by small municipalities, which are intrinsically facilitated by many more relationships rooted in the social fabric than larger municipalities have, because, in this last case the plurality of interests makes cohesion more difficult to reach. In the municipalities with a greater population density, not infrequently the PB process takes place by a territory partitioning in quarters or districts and its coordination often involves just a few parts of the city. In general, in order that BP can play a key role, it must not be a simple consultation, but a true voluntary process of opening from the administrative apparatus to participation, by sharing
of decision-making process and control by the citizens with their direct involvement in public choice and with the activation of the necessary flow of information needed to make participants aware of choices taken. Only by this way the PB may be an effective instrument of deliberative democracy and a strengthening of the programming process getting a positive impact on governance. The experimentation of PB in different Italian local governments not only showed an important educational content and a capacity to mobilize resources by spreading the concept of active citizenship through a more dynamic vision of democracy and its effects, but it has also helped to improve the transparency of the process, by stimulating a greater awareness of the concept of accountability of political bodies and managers. It has also permitted to those administrations that have dared to risk in this opening to control and direct involvement of citizens in our own, the construction of social pacts, inclusive of most vulnerable members of citizenship, and the growth of political consensus. In this sense, the PB represents an instrument of consensual strategic choices, supported by a co-sharing of difficulties, expectations, objectives and benefits, in the medium and long term. The implementation of PB is not the construction of a instrumental model but arises as the construction of a relational model able to simplify the choices and the tasks of public decision-makers, with the involvement of the users of these choices.

TITLE: IMPACT FINANCING FOR IMPACT ENTREPRENEURSHIP

Saltini, Tommaso

Università Cattolica del Sacro Cuore – ALTIS, Italy

ABSTRACT

The research aims at understanding how policy makers and public institutions can interact with different investors’ categories in order to design regulations and innovative investments funds. The scope of these instruments is to encourage impact entrepreneurs to start up sustainable businesses focused on finding solutions in order to face needs and problems affecting society.

The paper proposes a phased consequential plan, summing up priorities to be carried out by policy makers in order to catalyze impact capital for impact entrepreneurship. The plan presents consequential activities to be implemented by policy makers, instruments to set in place and actors to get involved. Different structures of impact capital funds, designed to catalyze both private and public capital, are also presented. Public capital can be crucial to encourage and catalyse both local and international investors as well as to bring in technical and financial expertise. Setting up public-private funds, both as co-investors and as guarantor, the public actor acts as a catalyst for first-time impact capital investors, creating the conditions and confidence for subsequent operations through demonstration effects.

Overall, the paper identifies key issues and instruments in order to pursue both social impact and financial results, thereby fostering a comprehensive development. Furthermore, the paper brings out the fact there is a growing set of investors categories and entrepreneurs that are willing and able to create both social and financial value.

Keywords: Entrepreneurship, Impact Capital, Venture Capital, Venture Philanthropy, Sustainable Development, Policy maker.

INTRODUCTION AND LITERATURE REVIEW

This research aims at understanding how policy makers and public institutions can interact with traditional investors in order to design regulations and innovative investments funds. The scope of these instruments is to encourage impact entrepreneurs to start up sustainable businesses focused on finding solutions in order to face needs and problems affecting society.
According to the most recent literature, impact investing has the potential to unlock significant sums of private investment capital to complement public resources and philanthropy in addressing global challenges (Bugg-Levine A., 2013; Clark C., Emerson J., Thornley B, 2013; Clark C., Kleissner L., 2013, Johnson K., Lee H., 2013; Saltuk Y., 2011; JP Morgan Report, 2010). Studies and reports published by The Global Impact Investing Network have been taken into consideration as well (www.thegiin.org). Impact investments are identified as investments made into companies, organizations, and funds with the intention of generating social and environmental impact alongside a financial return (Saltuk Y., Bouri A., Mudaliar A., Pease M., 2013; O'Donohoe N., Leijonhufvud C., Saltuk Y. 2010; Bugg-Levine A., Emerson J. 2011, Rangan V.K., Appleby S., Moon L. 2011). Both public capital and private capital converge in impact investing as well as venture philanthropy organizations are doing (Kohn H., Karamchandani A., Katz R., 2012, Thornley B., Wood D., Grace K., Sullivant S. 2011). Venture philanthropy organizations are also innovating their approach to investing in both profit and non-profit entities, providing them with both financial and nonfinancial support in order to increase their societal impact (EVPA Publication 2012). Nowadays, the venture philanthropy approach includes the use of the entire spectrum of financing instruments (grants, equity, debt, etc.) and pays particular attention to the ultimate objective of achieving societal impact (OECD Development Centre, 2014; Balbo L, Mortell D, Ostlander P, 2008; Cummings Metz A., Hehenberger L., 2010). Impact investments are carried out mainly by impact capital funds, but both venture philanthropy organizations and profit driven venture capital are increasingly committed to investments focused on social and environmental impact (Saltuk Y. 2011; Richter K. H., 2011). Impact capital funds are operating with the same technical features of venture capital ones, providing professional equity co-invested with the entrepreneur to fund an early stage venture, and providing seed or start-up financing (Black B., Gilson R., 1998; Bygrave W.D., Timmons J.A. 1992). The key characteristics of venture philanthropy funds as well as venture capital and impact capital funds are high engagement, tailored financing, multi-year support, non-financial support, involvement of networks, organizational capacity building and performance measurement (Buckland L., Hehenberger L., Hay M., 2013; Grossman A., Appleby S., Reimers C., 2013). Venture philanthropy, impact capital and venture capital funds differ in terms of priority given to social return and financial return. While venture capital funds are exclusively focused on financial return, impact capital funds are committed to impact investments (Credit Suisse, 2012; Morino M., 2012). These investments may generate a financial return, but the societal impact comes first. It is a so-called impact first strategy. Grant funding carried out by venture philanthropy funds, on the other hand, involves the provision of non-repayable donations to the social purpose organization supported. This is the case of an impact only strategy (Grossman A., Appleby S., Reimers

Literature related to venture capital industry development has also been taken into consideration (Black and Gilson, 1998; Gompers P., Lerner J., 1998, 1999; Gilson 2003; Landstroem H, 2007). Furthermore, the paper is carried out based on potential lessons learned from other countries in setting up venture capital instruments focused on developing a specific region or industry [Israel (Avnimelech 2008; Avnimelech and Teubal 2003; 2004a; 2004b), Germany (Becker and Hellmann 2005), Italy (Finlombarda 2002, 2003)] drawing important conclusions for emerging countries. Previous work has stressed the importance of a proper policy framework and supporting programs for fostering venture capital industry development (Avnimelech 2008; OECD 2000; 2004; 2006; Saltini 2006; 2013). However, this paper does not address the literature and the theoretical papers dealing with the venture capital industry but focuses instead on the interrelation that exists with the impact investing prospective. The results and contribution offered are strongly driven from the empirical analyses carried out in the selected countries of the Mediterranean Region and Europe.

METHODOLOGY AND OBJECTIVES

The considerations reported are based on the experience of special funds set up in a number of countries putting together both public and private resources. Information has been collected also looking at European investments funds investing in the Mediterranean region, i.e., countries around the Mediterranean Sea with the inclusion of Jordan. Moreover, empirical country analyses have been carried out in the following countries: Egypt, Jordan, Tunisia, Palestine, and Israel. Five junior researchers spent time over three years (November 2006, February 2010) along with a senior researcher (from 2006 until 2013) meeting key stakeholders, grouped in the three main categories: investors and fund managers; entrepreneurs and industry associations; and officers of public institutions and international organizations.

The empirical research was supported and carried out in collaboration with the United Nations Industrial Development Organization (UNIDO) field offices in Cairo, Tunis and Amman and from the headquarter based in Vienna. Empirical analysis was also carried out in the Lombardy Region of Italy, interacting particularly with policy makers, investors and philanthropists.

The following categories of actors were interviewed and proposals drawn with their support: regional investors, incubators, accelerators and technology parks, entrepreneurs from investee companies, investors, philanthropists, officers from public institutions and international organizations (multilateral organizations for development – MODs, development financial institutions DFIs). International regional conferences in Dubai, London, Bethlehem, Tel Aviv, Amman and Milan, in the
period 2006-2010, were also attended and proved to be useful for collecting significant information, and data and feedback from stakeholders.

Country empirical analyses have also been carried out spending long periods in the field researching in close cooperation and getting engaged with local and international stakeholders networks (Saltini 2006; 2009a; 2009b; 2010; 2013).

The first objective of this paper is to summarize, proposing a phased consequential plan, priorities to be carried out by policy makers in order to catalyze impact capital for impact entrepreneurship. The plan presents consequential activities to be implemented by policy makers, instruments to set in place and actors to get involved.

The second objective is to outline different structures of impact capital funds that aim at leveraging resources from different partners, investing both private and public capital. Consistently, the paper aims at drawing policy-makers attention to the emerging markets of the Mediterranean region as well sharing practical input to plan potential cross-border initiatives. Priorities and fund structures outlined have been developed using case studies, literature reviews and empirical analyses carried out at country level in the Mediterranean region.

The paper underlines the importance of coordination among different stakeholders to set up the right policy to create preliminary conditions for launching innovative financial instruments and investment models for sound and sustainable development affecting positively environment and society. Several impact capital actors’ categories need to act simultaneously in setting up innovative funds willing and able to ensure a positive and effective impact.

Considerable research remains to be done on impact investing policy and on practical investment schemes that can be set up, also with governments’ contributions, to catalyze impact investors.

A PLAN FOR POLICY MAKERS TO FOSTER IMPACT INVESTING

Governments setting proper policies play a crucial role for directing potential investors (public national and multilateral institutions, investment funds, foundations, individuals) into investments which have a social and environmental impact. The role a government chooses to play may be as a direct participant as co-investors in the market, or influencing through regulations (Thornley B., Wood D., Grace K., Sullivant S. 2011).

Policy makers must play an important role to ensure impact financing for impact entrepreneurship. A complete set of policies must be set in place geared toward the local and regional conditions that continuously enable the following of changes in circumstances and market evolution (Gompers P., Lerner J., 1998, 1999, 2001). Programs should focus on confronting specific country system failures and
aim at leveraging positive conditions present in the local context. A critical factor is policy makers’ capabilities that should be able to set priorities and translate them into programs and policies. Hence assembling skilled teams of policy makers, academic experts, and specialized professionals, is mandatory in order to design the appropriate policy to catalyse impact financing (Rangan V.K., Appleby S., Moon L. (2011). To create a venture capital industry significant efforts and coordination among different actors are required (Gilson R.2003). As learned from empirical analyses, two critical factors must drive policy maker attention: long-term timing and strategic markets development. Policies that support impact investing aim at creating investment ecosystems with a long-term prospective. Public resources must be committed to develop strategic markets and industrial sectors, so leading other sources of private capital, coming spontaneously while protected by policy objective. Policy makers must pay attention to allow preliminary conditions to emerge in order to catalyse impact capital investors and afterwards they must design regulations and invest public resources to start up and foster the beginning phase. Past successful experiences, and failures of European and American policy makers attempting to set up the venture capital funds to foster high-tech industry during the 80s and 90s, help to understand how important it is to create a positive environment (Becker R., Hellmann T., 2005; Florida R. and Smith D.F., 1993).

The design of a comprehensive policy framework represents a key issue for setting up a new impact capital industry, particularly for countries where social problems are spreading and where political turmoil is a threat. Empirical analyses carried out in the Mediterranean region confirm the importance of the government role to design good policy (Saltini 2006, 2009a, 2009b, 2010).

The Israeli and some European country experiences, both successful and unsuccessful, also support this evidence (Avnimelech 2008; Avnimelech and Teubal 2004a, 2004b; Finlombarda 2002, 2003; OECD 2000, 2004, 2006).

A phased plan is here proposed to foster impact investing for impact entrepreneurship, particularly in emerging markets. Key players (such as government bodies, development financial institutions, multilateral development organizations, universities, R&D centres, multinational enterprises, philanthropic funds and NGOs as well as private investors) need to act simultaneously in setting up special programs and policies to encourage the emergence of impact capital funds aiming at improving economic development ensuring positive impact on society.

A long-term economic development strategy should be adopted in order to phase the emergence, the beginning and the development of the impact capital industry in a specific region or country. Governments play a special role throughout the three-phased approach proposed. The policy makers can either influence impact capital development or play a direct role directing capital and participating with different level of involvement in setting up supporting programs and impact funds.
Governments along with universities and, in emerging markets as well, multilateral organizations for development and NGOs, have a significant role in pursuing the preliminary objectives of the emergence phase. Economic stability, reached through a sound investments policy framework, is a key factor to catalyse investors. However, impact capital, both from the investors and entrepreneurs side, is a people-intensive business. Technical assistance is crucial, improving training offer and cultural awareness, and is a way to contribute to the development of impact business models (Bugg-Levine A., 2013). Conditions to generate impact and make a contribution are always to be able to learned, as well as investment passion and creativity in solving problems. In this phase, it is important to improve the ability to take the initiative, and to foster the desire, particularly in the young generations, to do business to find effective solutions.

To pursue and reach economic sustainability it is necessary to move away from the logic of exploitation and short-term financial speculation. It is necessary to create new financial entities that work with new spirit to developed long-term strategies, creating value innovating products and optimizing production through process innovations.

In the beginning phase, the first objective is to support impact entrepreneurs to design and validate business models (Kohn H., Karamchandani A., Katz R., 2012). Extremely challenging but particularly relevant in emerging markets is to focus upon supporting R&D activities, the enhancement of innovation capabilities, and the stimulation of entrepreneurship culture. Therefore, governments should commit resources to enhance R&D programs and projects, in order to create new products and services for launching innovative impact businesses and for innovating traditional industries as well.

A second objective must be to design policies directing capital more toward impact opportunities (Thornley B., Wood D., Grace K., Sullivant S. 2011). This can happen by launching supporting programs and pilot funds, coordinating public and private capital, invested with the principal aim of generating other impact funds. In this phase, key actors are the impact investors, both impact first and financial first investors (Monitor Institute, 2009; Richter K. H., 2011). Coordinating actors and integrating the different investing instruments is also crucial to ensure long-term sustainability for both impact entrepreneurs and impact funds investing in small and growing businesses.

In the development and consolidation phase it is important to launch a different typology of impact funds and to elaborate policy to foster their stability and capacity to implement long-term investment strategies. Attention must be paid to assure both social and financial return and to design a methodology to measure them. The design of proper development policies can increase the amount of impact capital. Policies dealing with investments rules and policies that provide co-investment increase the supply of impact investing capital by catalysing private investors, through risk sharing with governments (Kohler J, Kreiner T, Sawhney J, 2011). When an equity investor is investing in
small risky businesses, the involvement in the business development process of capacity development organizations, such as NGOs, MODs, DFIs or any other technical assistance organizations with specific industry expertise, is also appreciated.

In order to improve the exit opportunities for investors, policy makers must regulate properly also the merger and acquisitions market, in particular by improving transparency and financial information credibility (Hill K. 2007).

During the consolidation phase crises can arise. In this case, priority should be given to assuring a minimum level of activity in start-ups, targeting innovation. During critical times government involvement and forms of direct financial support can be a determining factor in the industry's survival and therefore help to overcome the crisis and reach a stronger consolidation status (Gilson R. 2003; Karaomerlioglu D.C., Jacobsson S. 2000).

Source: own elaboration

DFIs – Development Financial Institutions
MODs – Multilateral Organizations for Development

The overall objective of the proposed **phased plan for policy makers to foster impact capital for impact entrepreneurship** is to improve access to financial resources and catalyse impact financing. Impact entrepreneurs must be supported to get access to grants as well to debt and equity instruments. They must also be helped to understand if and when they need capital, as well as to understand terms for transition from one form of source of financing to another.

What appears to be crucial is that policies and programs should not create dependence on aid and grants, from private philanthropy and government programs. In the long term, any business, whether social or profit focused, should be scaled and provide returns to its investors.

**IMPACT FUNDS, BETWEEN PUBLIC AND PRIVATE**

Government institutions, along with development financial institutions, multilateral development organizations and NGOs, can facilitate the setting up of innovative impact capital funds, with participation by both private and public capital. These funds are the key instruments of the development phase of the proposed plan for policy makers. However, actors’ awareness must be pursued during the emergence phase. Different actors must be brought together in order to design common strategies, draft regulations and commit resources.

Impact capital funds, leveraging public and private capital, must be launched during the beginning phase. Impact funds, which leverage public and private resources and know-how, must have a well-focused mission to invest in industries that are crucial for the country’s development and should also be geared to develop depressed strategic sectors. These instruments thus have the final goal of setting up new companies and supporting growth of micro-small enterprises operating in underdeveloped regions. Different funds should be set up according to geography, industry, human capital group (youth, women, etc.), and country priorities (Kohler J, Kreiner T, Sawhney J, 2011; Godeke S., Pomares R., 2009). Therefore, public capital can be crucial to encourage and catalyse both local and international investors as well as to bring in technical and financial expertise. Public actors can reduce the risk of investing for impact, not only in depressed regions and in rational industries with steady growth, but also in the beginning phase of the impact industry development. This phase is still characterized by an incomplete policy framework and by the absence of certain investors’ categories, actors’ know-how and financial instruments in the market. The public actor acts as a catalyst for first-time impact capital investors, creating the conditions and confidence for subsequent operations through demonstration effects (Bouri A., Mudaliar A., GIIN, 2013). Public involvement to foster the development of a new
impact capital industry is desired but it is important to recall that the government as facilitator and investor should have the ultimate goal of creating self-sustainable markets rather than creating conditions for dependency. After target goal achievement, public actors are expected to timely remove their presence. Pressuring governments to take action as facilitators and investors also presents considerable risk, as this involvement could become too intrusive, thereby stifling real development. Risk of distortions is high and must be avoided. With particular reference to experiences analyzed in Israel, Italy, Germany and Turkey (EIF 2011; Avnimelech G., M. Teubal 2003; Finlombarda 2002, 2003; Becker R., Hellmann T., 2005) as well as with reference to the empirical analysis carried out in the Mediterranean region, funds schemes are proposed to be developed by mutual involvement of public and private players. Funds structures proposed should be properly adapted to address country and region specific weaknesses and challenges.

Public-private, fund of funds

A fund of funds can be set up as a national, international, and public-private partnership. A fund of funds is considered in this paper as a co-investor in other impact capital funds. The fund may also use part of the capital allotment to directly invest and co-invest in enterprises (Ramsinghani M., 2011; Strachman D. A., 2009; Bygrave W.D., Timmons J.A., 1992).

Public-private fund of funds is a financial tool that has been used with good incisiveness in several developed countries, to support venture capital funds focused on seed and early investment stages. The fund structure proposed refer to Yozma Fund in Israel, to ERP-EIF Dachfonds and LfA-EIF Facility in Germany, and iVCi in Turkey. (EIF 2011; Avnimelech, G., M. Teubal, 2004, and Israel Venture Association, www.iva.co.il).

A fund of funds is based on an agreement signed by parties that commit capital to invest in venture capital whose target is strictly related to the principles and priorities jointly indicated by the investors involved. Public-private fund of funds represent a good instrument to make use of public resources due to its multiplying positive effect of mobilizing and directing private funds to priority areas and strategic industries. This instrument is particularly useful to boost impact funds to invest in start ups and to help scaling business model with impact. A fund of funds structure is attractive to institutional investors, as it creates a portfolio approach that spreads the investment risk. The fund of funds approach also enables the government to support the growth of the key market and industry without
distorting or competing with other investors categories active in the country.

Public actors involved such as the ministry of industry, universities, research institutions, etc.) co-invest in private initiatives. The public actor in charge underwrites shares of fund of funds’ capital (share A) together with public and private institutional investors (share B).

The fund regulations establish ex ante that the public actor in charge underwrites shares of the fund that have different rights than the shares underwritten by institutional investors and by other private investors that invest in daughter funds in which the fund of funds co-invests. Shares A have a limitation on the maximum return in terms of IRR (Internal Rate of Return).

A development financial institution can also act as co-investor in a fund of funds instead of the government and thereby represents the public interest in the partnership.

**Capital guaranteed impact fund**

A capital guaranteed impact fund is an equity fund set up for raising private capital through a management company, whereby the capital is guaranteed by a public entity (ministry, central bank, development agencies in case of emerging markets and development countries, etc.).

The guarantor works adjacent to an impact fund, encouraging private investors investing either in other impact funds with a regional or industry focus or investing directly in impact enterprises, reducing the risk of losing the invested capital. The fund is managed by independent qualified managers and financed with private capital. The investments are guaranteed by a public entity, which has as its objective the increasing development of new, promising micro and small impact enterprises and strategic industries.
The fund firms and their managers are requested to follow specific guidelines dictated by the governments or related public institutions. So, the funds are provided to foster all those sector and economic activities that are considered priority objectives.

The impact fund is guaranteed by a governmental institution (guarantor) committing itself to repurchase a percentage of the participation (net of dividends) if the value of the latter, after a certain period of time (7-10 years) is evaluated lower than the original investment on the basis of predefined mechanisms. Acting as guarantor, the public actor can foster sustainable development without an immediate disbursement. The public actor will receive a guarantee fee from the fund and it will benefit from profit sharing. Furthermore, it will play an active role appointing some board members and exercising a veto right for investments exceeding a pre-established amount. Reducing the risk to invest on small business model focus on impact solutions, the guarantor spurs investors and so catalyzes local and foreign capital resources.

**Three partners impact fund**

The proposed scheme should be consist of three partners: government or international public institution such as a regional development financial institution, private investors and multilateral development organizations or non-governmental organizations. The use of a three partners impact fund is a recommended structure for developing countries with high risk factors and where the financial system is weak.
In the proposed scheme, government plays an active role as investor and in controlling the impact capital fund. Nevertheless, an independent and reputable management team must run the fund. Management is the key factor for any successful venture capital firm and particularly for an initiative driven by public money (Bygrave W.D., Timmons J.A., 1992; Gompers P., Lerner J., 1998).

A crucial role in setting up an impact fund, where the government is leading as investor, can be played by a third partner, represented by a multilateral development organization or by a non-governmental organization.

This category of actors, usually due to internal regulation constraints, cannot act as investors but only as facilitators investing grants capital.

Multilateral organizations for development, such as UN agencies and international NGOs, are willing to sustain government driven initiatives for industrial development. These stakeholders can therefore play an important role in the reduction of agency administrative costs, which are higher than usual when the impact fund is committed to invest in micro and small businesses. Intensive mentoring and monitoring activities need to be offered to foster the numerous companies in the portfolio. As well as making this important contribution, the benefit would consist in selecting a good flow of deals, by pointing out type and size of promising suitable investors.

An international and reputable actor, such as a UN agency, is a significant plus in securing the new fund nature and for highlighting the strong idealism for development of the institutional public investor which will commit financial public resources.

**Bi-national Fund**

A bi-national fund is established when two nations pledge a predetermined sum for the pursuit of common objectives. A direct participation of public institutions or ministries is foreseen. An agreement which defines the content of the project, its objectives, and activities to be carried out, is jointly prepared by the authorities and officers involved.
A similar initiative can be also be promoted by other parties, especially those preferably belonging to a specific region with common development objectives and where businesses and political interaction positively characterize country relations. A board of directors is appointed by the two governments, and is independent in its decision-making.

The bi-national fund represents a good instrument to streamline R&D projects, as well as to foster knowledge and capabilities sharing. This instrument has been specifically used by the Israeli government in the last few decades to consolidate relationships with historical friendly nations such as U.S. and Canada, as well as to explore new possibilities with nations such as Korea and Singapore.

For emerging countries, this instrument could represent a concrete support to improve overall economic and trade relations within key country partners. A bi-national fund is a good vehicle to favor synergies between companies from the two nations and facilitate technology transfer.

**RESULTS AND CONTRIBUTIONS**

The paper proposes a phased plan for policy makers in order to encourage long-term and strategic planning to foster impact capital for impact entrepreneurship.

Concrete impact capital schemes bringing together public and private actors were also elaborated and recommended to catalyse new resources.

The first empirical confirmation, coming from experiences and information collected in the field, is about the importance of bringing together social impact and financial return. These two factors are crucial for personal, corporate and society success.

Policy and investment strategy cannot be geared only toward the good of either the individual or a single community, but indeed to the common good for the entire collectivity. Policy makers have a key role in influencing stakeholders through laws and regulations set up to catalyse impact investors and supporting impact entrepreneurs.

The research underlines the fact that governments can provide direct and indirect financial support.
fostering investments in low-income communities and toward depressed industries and markets. When private capital seeks social and environmental benefits, there is an opportunity for governments to design partnerships and set up innovative funds.

The emergence and development of the impact capital industry will improve the matching between pure investors and philanthropist, as well as private and public actors.

Pursuing impact is a means, not only to prevent improper exploitation but also a good way to foster human creativity, industry potentiality and nation development. The paper brings out the fact that there is a growing set of investors categories and entrepreneurs that are willing and able to create both social and financial value. Giving importance and attention to the single person, the future, the environment, and to the importance of giving a contribution for the “others” around us, have an increasing value for a sound business development. The intention to generate impact must not be considered incompatible with the effective capacity to generate profit. In the society, challenges and needs are changing, but the need of partnership and to develop long-term strategy as well as need to face the difficulties the new generation are facing is consistent.

The paper proposes practical action at policy level and concrete investment schemes that can enable countries to become more competitive in attracting investments, overcoming barriers and maximising the impact of both local and international investors.

The research clarifies the importance of bringing all actors categories closer to working for impact. Players that play a key role are not only investors and entrepreneurs, but also all those stakeholders that can facilitate operations and preliminary conditions emergence such as governments, multilateral organizations for development, development financial institutions, universities, industry associations and specialized professionals.

Department of Agricultural and Forest Sciences, University of Palermo, Palermo, Italy

ABSTRACT

Wine cooperatives have a long tradition in Sicily, as well as in Italy and in Europe. The objective of this paper is to reconstruct the general framework of the Sicilian wine cooperatives that still account for nearly 80% of the regional wine grapes production. In this context we examine the productive, organizational and commercial strategies of a case study: Cantine Settesoli. Founded in Menfi (Western Sicily, Italy) in 1958 on the initiative of a group of wine grape-growers, the Cantine Settesoli has developed over the decades and now represents the major bottled wine cooperative in Sicily, whose 2,135 members own 5% of Sicilian vineyards. With its four wine-making plants, a volume of grapes processed in the last three-year financial period (2011-13) of more than 43,000 tons of grapes per year, an average annual turnover of €47.7 million, and a constant attention to environmental and social issues, Cantine Settesoli stands out as the protagonist in the wine scene, both national (especially with the brands Settesoli and Mandrarossa) and international (with the brand Inycon). It effectively implements traditional and innovative tools of productive, commercial and strategic management, thus representing a model of successful firm in a regional context of cooperatives generally pegged to productive and commercial strategies product-oriented.

Keywords: Wine cooperatives; Sicily; management; strategy; success; performance

INTRODUCTION

Wine cooperatives in Europe were established between the mid and late 1800s (Touzard et al., 2008; Pomarici, 2009) in order to cope with the economic difficulties of growers and also following the prevailing political ideology and sociological influences of the time (Touzard et al., 2008). These cooperatives are now continuing to be a vital economic resource, especially for growers with small vineyard plots. In 2010, in Sicily 40,629 wine-growing farms (equal to 10.4% of the national total), of which 41.4% had a wine growing area less than one hectare and 85.5% less than 5 hectares (Istat, 6th Agricultural census). The Sicilian companies when considered on an individual scale do not appear to have any opportunity to compete in the wine market, however when merged within a cooperative
business model, the results are substantially different, showing improved trading power in wine sale (Di Vita et al., 2013). As a result, wine cooperatives (thanks to public funds) are able to invest in technology, innovation and research, improve quality wine, promote new forms of packaging, reduce processing unit costs due to economies of scale (Copa-Cogeca, 2010). It must, however, be emphasized the growing presence of new country producers and exporters (Australia, United States, Chile, etc) - which in a very short time have shown efficient competitive capabilities in technical and economic terms (Ciasullo and Festa, 2013)-, the reform of wine Common Market Organisation (CMO) – targeted to reduce the productive potential of European Union (EU) countries and to guide the supply towards quality production (Pomarici, 2009)-, and in addition, the change in consumer’s profile (MiPAAF, 2013; Lanfranchi et al., 2014), particularly in developed countries -linked to the economic development of society and the change of wine-consumption habits-, which have significantly influenced both the structure of the sector and the balance between demand and supply of EU wine production, making it extremely challenging for those companies that operate within it, including cooperatives.

This is the context that fits the economic and productive activity of the wine-growing farms in Sicily. Between 2010-2011, 626 Sicilian bottling companies (private and cooperative) were accounted for a total bottled volume of 193 million pieces (Torcivia, 2012a), most of which produced by private companies; in contrast, a significant share of the regional production of wine grapes is delivered directly to wine cooperatives, which for several years have gone through a process of downsizing also due to the prevailing strategy of producing and selling musts and bulk wines. However, if on the one hand the number of cooperatives within the wine industry in Sicily has decreased, revenues -at least for larger companies- is on the rise, as well as figures concerning bottled wine (in terms of both pieces and turnover), which still remain in the modest numbers’ bracket (18.0%) in comparison to the overall supply of regional wine (Torcivia, 2012b).

Data presented by the Regional Department of Agriculture, Rural Development and Mediterranean Fisheries ranks Sicily first in the list of the Italian regions for overall land under wine grapes in 2013, accounting to 103,063 hectares. In the same year grape production amounted to 856,387 tons, while the overall wine production amounted to 6,150,007 hectolitres. In recent years, in face of a marked alternating production with downward trend, there has been a gradual decline in wine growing areas, due to their abandonment, characterized by low profitability, and to the implementation of the interventions provided by the wine CMO (Schimmenti et al., 2013), which led to an intense process of restructuring and conversion of vineyards in Sicily (Borsellino et al., 2012), resulting in quality improvement of wine-grapes which effectively allows to obtain excellent wines. This trend is confirmed in the Sicilian wine trade flows that, in the period 2000-2011 (Inea, 2013) have shown a significant contraction of exports in terms of quantity (-66.0%, due to the decrease in exports of bulk.
wines and musts), meanwhile showing an opposite trend in terms of value (+5.7%), related to the increasing amount of bottled wines.

Within the regional wine industry, Cantine Settesoli, subject of this study, differs distinguishably from the other cooperatives, as it has been able to combine tradition and strong local rooting with the new trends that shape wine industry. The aforementioned is, in fact, now the largest wine cooperative in Sicily for bottled volumes (about 2/3 of the net sales revenue in 2013, of which approximately 62% of all overseas turnover), and has a primary place in the national and international wine market.

The objective of this paper is to illustrate the way in which a cooperative society, encompassing the entire value chain, made its productive, organizational, sales and marketing strategies, a point of strength for the commercial success, and a model of market-oriented firm in a regional association context generally characterised by production and commercial strategies product-oriented; the above statement encompasses a strong enough reason to investigate, after a brief introduction on wine cooperatives in Sicily, all stages of the supply chain and the economic and financial performances of this case study.

LITERATURE REVIEW

In the EU, over 60% of agricultural produce is marketed by cooperatives (Copa-Cogeca, 2010) that nowadays, like other businesses, are facing increasing competitive pressures and have to cope both with new market opportunities and with a greater diversification of consumers’ needs and preferences. Cooperatives, unlike private firms, sustain a more conservative attitude revealing traditional preference for the low-cost focus strategy (Salavou and Sergaki, 2013) and facing greater difficulty in adopting market-oriented strategies (Bono et al., 2012). The above statement supports Hardesty (2005), who found that many agricultural cooperatives have chosen a cost-leadership strategy, producing as a private label supplier, but only few cooperatives have developed national brands, because of their structural characteristics. Traditional cooperative governance model, in fact, can partially affect development path and efficiency of the cooperatives (Bono et al., 2012) and also the implementation of a market-oriented strategy (Hardesty, 2005; Beverland, 2007; Bono et al., 2012; Couderc and Marchini, 2011). In order to gain competitive positions both within and outside Europe, cooperatives have to move towards more market orientation (Beverland, 2007), by formulating innovation strategies (Perlines et al., 2013), improving quality, distribution management, distribution channels and marketing conditions (Hardesty, 2005; Beverland, 2007), as well as productive efficiency. The current economic situation, with the entrance on the world productive scenario of new countries (Crescimanno and Galati, 2013) with a more aggressive marketing policy (Ciasullo and Festa, 2013) and new competition tools (brands, grape varieties and PGI products), has forced wine cooperatives
to adapt and respond to the new wine market competition arena (Coelho and Castillo-Girón, 2011) by increasing their size, seeking to establish strategic alliances, pursuing mergers with other cooperatives, rationalizing assets, improving the professionalism of their workforces, implementing innovative capital acquisition methods and formulating strategies to expand into multi-country markets (Pomarici, 2009; Perlines et al., 2013). Maietta and Sena (2008, 2010) analysed Italian wine firms and found that cooperatives are well-equipped to cope with increasing market competition and financial constraints. Bono et al. (2012) and Couderc and Marchini (2011) observed that wine cooperatives had successfully improved their competitive position through two main different strategies outlined below: structural costs (bottling plant, storage hall, marketing and sales efforts) saving and marketing large volumes of bulk tailored wine made for market leaders “négociants” and their private labels (“differentiated” B2B market), or the implementation of processing activities in order to shift their product range from bulk to bottled wine with their own brands (B2C market). More recently, Schamel and Santos Arteaga (2013) reveal that Alto Adige (Italy) wine cooperatives manage to organize their production decision in such a way to be able to compete -and even beat- with private wineries in terms of wine quality and reputation. Barros and Santos (2007) highlight that Portuguese wine cooperatives are allowed to be more efficient than their private counterparts thanks to different resources, scale economies and organizational structure.

The cooperative sector is pivotal within the Italian wine industry in terms of diffusion, numbers and strategic relevance, covering in some regions (Abruzzo, Sicily and Trentino-Alto Adige) over 65% of the regional wine grape production (Capitello and Agnoli, 2009); Sicily, Veneto and Emilia-Romagna represent on a whole around 60% of the overall national wine production from cooperatives (Pomarici, 2009). Cooperatives take also part in important consortium, as the Chianti Classico one, carrying out operations of purchasing, production and bottling (Gaeta and Corsinovi, 2013). Recent studies analyse and verify the health status of wine cooperative sector both at domestic level (Pomarici, 2009; MiPAAF, 2013; Ufficio Studi di Mediobanca, 2014;) and in some local contexts (Maietta and Sena, 2008, 2010; Capitello and Agnoli, 2009; Chinnici et al., 2011; Couderc and Marchini, 2011; Torcivia, 2012a, b; Schamel and Santos Arteaga, 2013). These studies outline a new Italian wine cooperation system, whose productive focus shifted to the production of valuable products (bottled or aging wines) that reach directly, even with effective branding policies, the final market, especially the international one, from which a growing wine demand is observed (in face to a significant and structural decline in domestic consumption).
SURVEY METHODOLOGY

In order to outline the framework of Sicilian wine cooperatives, in the absence of complete and comprehensive official data, we used records published in previous papers related to this theme (Torcivia, 2009, 2012b) and provided by the Regional Department as well as data collected directly from the web page of the Sistema Informativo Agricolo Nazionale (SIAN).

The investigation of the Cantine Settesoli carried out through direct interviews and a survey questionnaire used in previous researches (Schimmenti et al, 2011) and adapted to the wine sector. The questionnaire (organised into three sections, the first one relating to the general characteristics of firm, the second part relating to the analysis of the technical aspects of production and processing, and the third one concerning the commercial aspects as well as aspects involving the use of hardware and software’s infrastructure), submitted to Settesoli managers on several stages due to the complexity of the cooperative activities, allowed the collection of data concerning production, processing and trading topics with reference to the financial years of 2011-2013 (each financial cycle opens on July 1st and ends on June 30th of the following year, therefore the data collected refer to the grape-harvests 2010-2012), and socio-structural and managerial aspects referred to the 2013 year, thereby reconstructing all the stages of supply chain. The study also provided the evaluation of the cooperative’s performance by analysing its financial statements of the last three administrative-accounting years (2011-2013), made comparable by performing the reclassification of the Balance Sheet (based on financial criteria) and Income Statement (on the basis of value added), and the determination of the main financial ratios: profitability ratios (ROI, ROS, ROT and ROD), structural indicators of assets (the rate of the circulating assets and the rate of the fixed assets), of the liabilities (financial autonomy and debt ratios) and of balance sheet (equity-to-fixed-assets ratio, working capital and current ratio, and quick ratio). ROI, ROS and quick ratio were also compared with those ones obtained from other surveys on the regional and national wine sector (Ufficio Studi di Mediobanca, 2014; MiPAAF, 2013).

WINE COOPERATIVES IN SICILY

Wine cooperatives in Sicily were born in the ‘30s, but began to have relevance only in the early ‘70s, showing a substantial growth up to 2001, when 102 active cooperatives were recorded. In the following years, up until now, the sector has experienced a significant reduction in numbers, especially due to product management issues or to the phenomena of merging and acquisitions (Torcivia, 2012b).

In 2013, based on the SIAN data, the cooperatives which have regularly declared their wine production were 59, with a total of over 0.7 million tons of wine-grapes delivered, with a ratio of 82%
among the production of wine-grapes within the regional production; those deliveries have concerned in prevalence white grapes (0,5 million tons) as opposed to the black ones. The presence of wine cooperatives has always been more consistent in the province of Trapani (33 units in 2013) province has the regional leadership in terms of wine growing area, followed by the provinces of Palermo and Agrigento with a significantly lower number of cooperatives (respectively, 12 and 9). Moreover, according to the data collected from the SIAN web page in 2013, there were 19,471 wine-grape suppliers (both members of cooperatives that non-members) within such companies; in particular, there are only three cooperatives with over 1,000 suppliers: Cantine Colomba Bianca (1,836 units), Cantine Settesoli (1,691 units) and Cantine Ermes (1,045 units). When taking into consideration the vineyard area, only Cantine Settesoli and Cantine Colomba Bianca exceed, individually, the threshold of 4,000 hectares of vineyards, while within the processing aspect only four coops (Cantine Colomba Bianca, Cantine Ermes, Cantine Settesoli and Cantine Europa) processed more than 40,000 tons of grapes each.

RESULTS
Managerial, socio-structural and productive aspects
The organization of Cantine Settesoli is very complex and articulated. More specifically, the winery has established an organizational structure in which managerial responsibilities of the various business functions, broken down by sector technical management and distribution channel/destination market, are delegated to managerial roles with specific skills according to a pyramidal system of responsibility.

Founded in Menfi (in province of Agrigento, Western Sicily) in 1958 with the legal status of agricultural cooperative society, Cantine Settesoli’s mission is to enhance the wine grape production of its members, and to protect and improve the conditions and activities of members operating within the local area. Its vineyards’ areas, which extend for about 5,500 hectares, make it not only the largest vineyard in Sicily (covering around 5% of the regional wine growing area), but also a great source of employment for farmers and more generally for the local population as a result of the generated satellite activities. The members of the cooperative amount to 2,135 (of which 1,841 delivered their production in the 2012 harvest), mostly represented by farmers; at the same time the cooperative resorts to non-members wine-growers.

In 2013, the number of permanent employees accounted for 47 units (14 staff units more than in 2011), while seasonal workforce was employed for a total of 26,091 working days (1,184 days more than in 2011).
The four wine-making plants, together with bottling, packaging and storage of wines cover an area of 18,960 square metres, with the addition of squares, cars parking, roofed areas, etc. with an overall outer surface of 94,783 square metres.

In the “vineyard Settesoli” the most common method of grape growing is the simple spurred cordon, and the cultivation of both indigenous and non-indigenous grape varieties (black and white grape) can be found.

Processing and commercialisation

After the harvest (in recent years mechanised harvesting of white grapes during the night has been introduced) and the delivery of grapes to the cooperative, the process of winemaking begins in its different stages: crushing, fermentation and subsequent classification of each batch in order to create specific cuvée. The production cycle is completed by an automated line for bottling and packaging, with an effective capacity of about 9,500 pieces/hour (bottle, bag in box and tetra-brick). The data regarding the last 4 grape harvests show a remarkable production variability, with a minimum peak in 2011 (41,213 tons of processed grapes) and a maximum peak in 2013 (55,982 tons), mainly ascribable to climatic conditions (Table 1).

In the three grape harvests 2010-2012, there has been an increase in the average price paid per ton, due to the increase in sales prices both in Italy and abroad; the aforementioned confirms the validity of the company’s strategy to focus on wine quality and on the more lucrative markets.

Cantine Settesoli focuses its commercial strategy on brand’s reputation, on the perceived value of the product and a complete line of products which has three brands of packaged wine - Settesoli, Mandrarossa and Inycon - covering all price and consumption ranges.

Inycon, available only on foreign market, has successfully been sold for over 10 years within the major grocery chains in the United Kingdom. The brand is also becoming popular within other markets such as Belgium, the Netherlands and Switzerland.
In Italy, however, the company has decided to focus solely on Settesoli and Mandrarossa lines. For the Settesoli label the company has created a national sales network to ensure a widespread presence across the country through large-scale retail channels (around 15). The brand, aimed at a target audience of consumers who ask for a good wine at an affordable price, includes three product lines: the line “Settesoli GD” (with a final price of 3.50 - 4.50 €/bottle), the line “Porta Palo” (2 €/bottle), and the line “Torre Solada (1.20 €/tetra-brick).

The “Mandrarossa” wines represent the top range: produced from a careful selection of grape varieties, are marketed towards a medium-high target (Ho.Re.Ca, etc.) market, with an average sales price of about 10 €/bottle.

Finally, in addition to the three aforementioned brands, part of wine is bottled and marketed with private labels of channel stores, whilst another part is sold in bulk quantities.

Most of the cooperative revenues (the average figure for the three years amounted to 47.7 million €/year) derives from the sale of packaged wine, followed at a considerable distance from the bulk one; the revenue generated by the sale of musts and other minor products is very low. Packaged wine is primarily marketed in the foreign market, while the bulk wine and the musts are addressed to the national market (Table 2).

The business strategies adopted by the company for bottled wines are closely linked to different markets and distribution channels: within the international market, business relationships are managed through a joint venture with a British partner, while in the national market the medium-term objective is to propose, especially in the large-scale retail channel, increasing volumes of product with excellent value for money. It is not, however, disregarded the sale of products at reasonable prices (tetra-brick) driven by specific demands of consumers with limited disposable income. The business strategy of the company provides, among other things, the launch of new products and packaging.

M.C./M.C.R.: Concentrated grape must/Rectified Concentrated Grape Must.

Informatisation and communication

The cooperative utilizes very innovative hardware and software tools for various activities, such as orders, sales and quality management, warehouse operations, payroll activities, contract management and marketing operations.

Cantine Settesoli has two websites (www.cantinesettesoli.it and www.mandrarossa.it) providing a wide variety of information and services: wine shop, where consumers can buy products directly from the cellar. The Internet is also used to access banking services, to source new customers and suppliers, for on-line purchasing and for e-learning.

On each label of the Cantine Settesoli packaging there is a stamped identification code that allows to travel backwards through all stages of the supply chain. In addition, on Settesoli and Mandrarossa labels there is the QR Code that refers the consumer to an iPad app created by the cooperative and promoted for the first time at the 2013 Vinitaly.

The process of the Settesoli brand-building began some years ago with a strong marketing strategy promoted on national TV, on Sky Sports channels, on some of the press, the web, and through the marketing at both national and international wine fairs.

Throughout the year, Cantine Settesoli welcomes enthusiasts and professionals from all over the world for guided tours (in several languages) which start from the vineyard and continue and conclude in the cellar with a wine-tasting.

Research and development

The company, also with the collaboration of Regional bodies, has been actively involved in research and development, in order to keep up to date with new technological means of production, wine quality improvements, sourcing of raw material and embrace a sustainable method of packaging its products.
The cooperative has also embarked on a long research program aimed at broadening its ampelographic base and hence improve the quality of their wines; the results of such research are then transferred to all the members. The company has recently developed a photovoltaic system with a total capacity of 537 kWp and a biomass plant that generates “clean” heat and power through the use of led lamps, and has also adopted fibreless wood paper for its packaging operations. In 2003, the company has also successfully achieved the major goal to be able to fully trace and certify each stage of the production cycle; and currently it has a large number of quality certifications, some of which are explicitly required by the foreign market. Finally, the company supports and embraces humanitarian programs.

Economic and financial performance

The economic and financial analysis of a cooperative operating in the agri-food system must encompass various factors that characterize these types of company, such as the limited equity capital, participation of members in the financing under various forms and the mutualistic aims pursued (MiPAAF, 2009). Transformation cooperatives tend to remunerate their members at a greater rate than the market prices; therefore, their income statements do not generally indicate profits, with a significant impact on the financial ratios.

As noted above, this study has taken into consideration the financial statements of Cantine Settesoli of the last three administrative-accounting years (2011-2013). The analysis carried out, with reference to the composition of the assets, shows a high prevalence of current assets, which stood stable at around 72-73%, mainly represented by trade and other receivables (consisting mostly in short-term loans to customers and members) and wine inventories, while fixed assets, principally composed of the tangible assets, are approximately 27-28% (Figure 1).

The examination of the company’s liabilities shows an overall low level of capitalization (net equity) - that is distinctive among cooperative societies- and a significant use of borrowed capital -among which current liabilities have a clear and growing prevalence- that is offset by a gradual reduction in consolidated liabilities (consisting mostly in self-financing members, which amounted last year to just over €9 million, and in medium-long term liabilities).
An examination of income statement highlights a significant proportion of raw material costs (varying between 69.5% and 72.4% in the three investigated years) and the breakeven reached at the end of the financial year, taking into account the distribution of profits to members.

The value added shows an increasing trend (from €6.8 million to €6.9 million) but fluctuates when considered in relative terms; a similar trend was noted for the gross operating margin. The operating income of Cantine Settesoli shows an increasing trend (reaching €511,588 in 2013). Financial charges show a negative trend due to increased exposure to the banking system (from €608,109 to €907,995).

More specific information on the company’s profitability may be obtained by reading the ROI, which has increased the given figures slightly by around 1% (Table 3). These values are lower than the average in the sample of 33 Italian cooperatives (3.0% in 2012) and in the sample of regional wine firms, coops and not (1.3% in 2012) as reported on the wine sector survey carried out by the Ufficio Studi di Mediobanca (2014).

Table 3: Balance sheet ratios in the triennium 2011-2013.
From the analysis of ROS, its growth appears to be steady inclined, which signifies a positive sales policy accrued by the company, although the figures are still relatively low when compared with those ones collected by MiPAAF (2013), related to others medium-large wine cooperatives (2.4% in 2011). Within the three years, ROT figures show stable values, whilst low ROD values (albeit increasing) indicate the careful choices made by the cooperative in accepting external sources of finance. Finally, the leverage shows an increase in corporate debts.

Among the structural indicators, those relating to assets confirm the high degree of elasticity of the invested capital, which denotes the ability of the cooperative to adapt suitably to changing market conditions; whilst the composition of the liabilities highlights the lack of financial autonomy that may cause difficulties in accessing to credit, settlement of liabilities and development. Referring to balance sheet indicators, the equity-to-fixed-assets ratio assumes decreasing values but higher than 1, expressing a sustainable situation in terms of the strength of the company’s assets. The assessment of cash equivalents by the cooperative was made through the determination of the working capital and the current ratio, which indicate, respectively in absolute and relative terms, a good availability of the firm even though in steady decrease. Within the analysis of the company’s solvency, the quick ratio shows, in 2013, a situation in which short-term debt may be extinguished only by the return in liquid form of a part of inventories. The above is in line with data reported in the survey on the national wine cooperation carried out by the MiPAAF (2013).

**DISCUSSION AND CONCLUSION**

The winemaking industry has represented for many years a leading market within national and Sicilian agro-food sector, which continues to be object of investments. Within the same sector, wine cooperatives play an important role, especially in those regions, as the case of Sicily, where supply is fragmented. The Sicilian cooperatives in recent years have reported a numerical scaling, although a high number of product-oriented companies still concentrate most of the regional wine supply, without having been yet oriented towards the production specialization (in alternative to bottling) achievable, according to Couderc and Marchini (2011), through the production of bulk wine suitable to contract specifications aimed at satisfying market leaders as négociants and their private label (B2B differentiation strategy). Herein we analysed the activities of the supply chain implemented by the cooperative Cantine Settesoli, a very prominent wine-producing market-oriented company on both regional and national level, whose evolution has ensured an efficient management and beneficial outcomes for its members.

To keep up with the ever changing wine market, the cooperative Settesoli, which ranks first in terms of bottled wine within the Sicilian wine cooperatives, has the goal to increase the production of the
more profitable brands, although it still sells a significant amount of bulk wine. At the same time, the cooperative is aware of the various markets demands and the different consumers and therefore is inclined to continue with the production of more affordable wine products that can be used on a daily basis.

The cooperative carries out on-going research and development aimed at improving the quality of its produced wines, through the use of technical means and advanced technologies.

On an international level Cantine Settesoli has established a very prosperous joint venture with a British partner, and on a national level it has established trading affiliations with the large-scale retail channels (main distribution channel in Italy) -despite they have proven to be costly and lengthy with their payments (60-90 days)- and with the restoration, in which the most criticality concerns payment timing (in many cases over 120 days).

By investing about 3% of its turnover in marketing and promotion as well as having increased its sales in the domestic and international markets, Cantine Settesoli plays a pivotal role among the local community, also in terms of tourist attraction by promoting and participating to wine and gastronomic events. From a management point of view, these initiatives have greatly increased the complexity of the business and its programming and created the need for relevant managerial skills, but requiring at the same time the use of external financing due to the lack of financial autonomy, characteristic of agri-food cooperatives and in particular of wine cooperatives.

Cantine Settesoli successfully implements traditional and innovative management tools, and given its growth prospects, it can be viewed as a business model to be followed, as part of a cooperative Sicilian wine system that must face an increasingly competitive market. In this regard, future research could be directed towards the study of those Sicilian cooperatives still product-oriented but able to develop themselves towards a B2C market or to differentiate their B2B strategy through the offer of “differentiated” bulk wines.

EXPATS IN LUXEMBOURG: HOW CULTURAL SPECIFICITIES IMPACT THE USE OF SOCIAL NETWORKING TECHNOLOGIES AND HUMAN RESOURCE PRACTICES IN LUXEMBOURG

Schinzel, Ursula

United Business Institutes, Luxembourg

ABSTRACT

The purpose of this research is to investigate, in this world of global mobility, the cultural and language characteristics of Luxembourg that may influence the tendency of HR specialists in Luxembourg to utilise NSNT. The methodology is first a profound literature review in global mobility, in HRM and NSNT, second interviews in 41 companies, and third questionnaires in 1 company with 134 filled-in questionnaires, evaluated in SPSS. Findings are: first, the author finds that HR managers are reluctant to using NSNT, keeping practices surprisingly mainly unchanged. Second, looking at the specific political, economic and historical context of Luxembourg using Hofstede’s cultural dimensions, the author finds that Luxembourg has a high level of ‘Uncertainty-Avoidance’, ‘Long-Term-Orientation’ combined with ‘Happiness’. Limitations are the comparatively small sample size, the data collected only in one company, and the lack of a strong theory to link culture and happiness, and could all have biased the results and their interpretations. Practical implications are given for expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, trying to cope with the cultural and linguistic specificities described in this research, especially in the HR Domain and global mobility. Regarding social implications, the author hypothesizes that the reluctance to use NSNT is related to Luxembourg’s high score on ‘Uncertainty-Avoidance’ and that Luxembourgish language is used as an identifier. The originality of this research lies in its usefulness for expats, global managers, in their attempt of integration into Luxembourg.

Keywords: Global mobility, expats, Human Resource Management (HRM), Social Networking, cross-cultural management, Hofstede’s cultural dimensions

INTRODUCTION

The purpose of this study is to explain to expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, in this world of global mobility trying to cope with the cultural and
linguistic specificities described in this research, especially in the Human Resources Domain the impact of social networking technologies on human resources practices in Luxembourg while analysing the cultural pattern of Luxembourg. Digital social networks like LinkedIn, Viadeo, Xing, Facebook and Twitter have revolutionised human resources practices. This research investigates (1) global mobility and expats, (2) dimensions of culture, (3) economic, geographical, political and social context in Luxembourg, (4) Luxembourg’s history, (5) culture and language, (6) Luxembourgish language, (7) Human Resource Management, and (8) social networking technologies. In this world of global mobility, this research investigates the extent of the use of new social networking technologies in Luxembourg, considering its cultural pattern. For expats, their spouses and family, the Grand Duchy of Luxembourg and its specific place in Europe are detailed. The research will be undertaken within the specific political, economical and historical context of Luxembourg. Hofstede’s dimensions of culture are discussed: ‘Individualism/Collectivism’, ‘Power Distance’, ‘Masculinity/Femininity’, ‘Uncertainty Avoidance’, ‘Long-Term Orientation/Short-Term Orientation’, ‘Indulgence versus Restraint’ and ‘Monumentalism’. The hypothesis is discussed that this reluctance to use social networking technologies is founded in Luxembourg’s high score on ‘Uncertainty Avoidance’. Also the fact, that the Luxembourgish language, a challenge for all expats, is used as an identifier in the Grand Duchy, might represent a brake to the extent of use of new social networking technologies. Human Resources Practices have a historical background and have developed throughout the years. While standard HRM was for a long time exclusively about HR administration, it is nowadays still about HR administration but also about recruiting and staffing best practices, talent management, and more and more about communication, new social technologies and e-HR. The research question is: Why have human resources specialists in Luxembourg been reluctant to utilise new social networking technologies, considering its special cultural pattern following Hofstede? Interviews, questionnaires and case studies are performed in 41 companies in Luxembourg. Results are presented. Conclusion, references and appendices follow.

GLOBAL MOBILITY

Globalization of business intends global mobility of people. These people move from one country to another, moving their entire family and homes, taking on responsibilities and encountering challenges never thought of (Brookfield 2011). Cross-national collaboration (Hinds et al. 2011) is increasing, bringing increasing complexity, fragmentation (Tharenou 2005) and employees’ careers challenges, given the intensity of global mobility and repeated staff transfers (Shaffer et al. 2012).

Most expat destinations are United States, China, and United Kingdom (Brookfield 2011). Despite some recent research, there is a lack in knowledge concerning expatriation, especially in small, so far
unexplored countries, such as the Grand Duchy of Luxembourg. This research intends to provide information both for companies and individuals, facilitating the expatriation process into Luxembourg, providing insight into (1) global mobility, (2) Luxembourg’s special culture, (3) Luxembourg’s history, (4) Luxembourg’s language, (5) Human Resource management practices in general (6) social networking technologies in general and in Luxembourg.

Among the existing literature the research is investing into research of short-term international assignments in multinational companies facing cost issues together with rising staff mobility, including short-term, commuter, rotational, contractual and virtual assignments (Tahvanainen et al. 2005). It is also researching into career choices, challenges and career consequences associated with corporate global employees – flexpatriates, short-term assignees and international business travellers (Shaffer et al. 2012). When staffing global positions, challenges arise through the manageability of multiculturalism (Harvey et al. 2011) trust – affective and competence-based – helps subsidiary acquiescence to headquarters. Intercultural aspects of collaboration across national boundaries are researched by Hinds et al. (2011) using social networks and technology use to illustrate how cultural differences generate different behaviour, explaining potential incompatibilities in the global workplace. This shows that mostly the complexity of global staffing in expatriate assignments is underestimated and more strategy is needed for global staffing (Collings et al. 2007; Welch et al. 2007). Also the complexity of work-family conflict, psychological turbulences in international assignments and exacerbating effects of the expat-commitment are researched by Shaffer, Harrison, Gilley, and Luk (2001).

**DIMENSIONS OF CULTURE**

Geert Hofstede (1980), in his monumental research on culture at IBM, has instigated worldwide research efforts. Culture has been found to have dimensions, the question is not if, but how many. Hofstede initially came up with four dimensions - Individualism versus Collectivism, Uncertainty Avoidance, Power Distance, and Masculinity versus Femininity. He later added a fifth dimension, Long-term versus Short-term Orientation (Bond and Hofstede 1983), and has just added a sixth dimension - Indulgence versus Restraint (Hofstede 2001) and together with Minkov (2011) is about to add a seventh dimension - Monumentalism.

Hofstede (1980) defines culture as the “collective programming of the mind which distinguishes the members of one human group from another”. Hofstede defines Uncertainty avoidance (UAI) as “the extent to which people feel threatened by uncertainty and ambiguity and try to avoid these situations” (Hofstede 2001). He defines Individualism (IDV) as “people looking after themselves and their immediate family only, versus people belonging to in-groups that look after them in exchange for
loyalty” (Hofstede 2001). The individualism/collectivism cultural dimension has been researched in
detail by Triandis (1995) and Triandis and Gelfand (1998) dividing into four dimensions: vertical and
horizontal individualism and vertical and horizontal collectivism. Power Distance (PDI) is defined as
“the extent to which less powerful members of a society accept and expect that power is distributed
unequally” (Hofstede 2001). Masculinity/Femininity (MAS) is defined as: “the dominant values in a
masculine society are achievement and success; the dominant values in a feminine society are caring
for others and quality of life” (Hofstede 2001). Hofstede (2001) defines Long-Term Orientation (LTO)
as “the extent to which a society exhibits a pragmatic future-orientated perspective rather than a
conventional historic or short-term point of view.” Hofstede defines Indulgence versus Restraint (IVR)
as: “Indulgence stands for a society that allows relatively free gratification of basic and natural human
drives related to enjoying life and having fun. Restraint stands for a society that suppresses
gratification of needs and regulates it by means of strict social norms” (www.geerthofstede.nl).
Minkov defines Monumentalism (MON) versus Flexumility as: high pride, immutable identities,
values, norms and beliefs (Minkov 2011).

Today, Hofstede’s work is known, accepted, praised, replicated, and also criticized. Some significant
culture studies have followed Hofstede. They include culture research projects such as the Chinese
Value Survey by Bond et al. (2004), Cameron and Quinn (2011), De Mooij (2011), Gert Jan Hofstede et
al. (2002), the GLOBE by House et al. (2004), the European Value Survey and the World Value Survey
era are Scholz and Böhm (2008) who specialize into Human Resources and Lewis (2006) who
specializes in language programming. Researchers beyond the Hofstede’s era, such as Nakata (2009),
Briley (2009), and Hong (2000), have extended cultural research into psychology, anthropology, and
philosophy.

In 2010, together with his son Gert Jan Hofstede and Michael Minkov, Hofstede published “Cultures
and Organizations, Software of the Mind, Third Edition”. In this edition Hofstede et al. surprised with
a sixth dimension of culture titled “indulgence versus restraint”, or “subjective well-being” or
“happiness,” constructs. The influence of Minkov is not only felt by the addition of a seventh
dimension of culture titled “Monumentalism”, but also Hofstede’s advice not to invest further in data
collection, but to rather use secondary data, as Minkov (2010) who analyzed Inglehart’s data from
www.worldvalue survey.org , has done.

Geert Hofstede’s research has not only been subject to enthusiasm (Sorge 1983, Triandis 1982), or to
reviews (Cooper 1982, Eysenck 1981, Smith 2002, Smith 2006) but also to criticism, contestation and
made a paradigm shift in cross-cultural studies, and as Kuhn (1970) has shown, paradigm shifts in any science meet with strong initial resistance” (Hofstede 2002). The discussion exchange between Hofstede and McSweeney is regarded as closed by Hofstede. Hofstede also had an exchange with Hampden-Turner and Trompenaars (1997) about the validity of their filled-in questionnaires. The debate between Hofstede and the GLOBE led Smith to write his 2006 article about the famous elephants. The five main criticisms of Hofstede’s approach have been enumerated by Hofstede (2002) himself: “(1) Surveys are not a suitable way of measuring cultural differences; (2) Nations are not the best units for studying cultures; (3) A study of the subsidiaries of one company cannot provide information about entire national cultures; (4) The IBM data are old and therefore obsolete; and (5) Four or five dimensions are not enough.”

This study takes on the second challenge of Hofstede’s criticism, namely, that national boundaries are not the best unit of analysis of studying culture, and uses the example of Luxembourg to demonstrate that language is a better identifier of culture rather than geographical boundaries of nations. It compares data collected in three subsidiaries of one company in Germany, France and Luxembourg, to demonstrate that Luxembourg's dimensions of culture are not proxies for the average values found by Hofstede in France and Germany, but rather are unique and a result of Luxembourghish, which, along with French and German, is one of the official languages of the Grand Duchy. Hence, the next section delineates background information about Luxembourg such as economic, geographical, political, social, historical and language, as well as some research reports about culture and happiness in Luxembourg, followed by a set of hypotheses.

ECONOMIC, GEOGRAPHICAL, POLITICAL AND SOCIAL CONTEXT IN LUXEMBOURG

Luxembourg is a parliamentary democracy with a constitutional monarch at its head. Along with Belgium, Germany, France, Italy and the Netherlands, the Grand Duchy was one of the signatories of the Treaty of Rome in 1957. The ensuing creation of the EEC (European Economic Community) and EURATOM (European Atomic Energy Community) formed the nucleus of the later EU. On 18 April 1951 it was a founding member of the CECA (Communauté Européenne du Charbon et de l’Acier, or in English, European Coal and Steel Community), the Paris treaty, together with the Federal Republic of Germany, France, Italy, the Netherlands and Belgium. In Luxembourg, European cultures meet on a small piece of land, that hosts people with high level of tolerance. The European Commission has its seat in Brussels and Luxembourg. On May 1st, 2004, ten new countries joined the European Union, including seven former Eastern Bloc countries. On January 1st, 2007 two more such countries joined, establishing the current membership at 27 countries.

The Future of Entrepreneurship

The Grand Duchy of Luxembourg's motto is: “Mir wölle bleiwe wat mir sinn”, which in English means “We want to remain what we are”. The capital of Luxembourg carries the same name as the monarchy. Official languages are German, French, and Luxembourgish. The Government is a Parliamentary Democracy and a Constitutional Monarchy. The Grand Duke's name is Henri; the Prime Minister is Jean-Claude Juncker. The population is growing fast, as in 2009 it was approximately 493,000, in 2010 it was approximately 502,000 and in 2011 it was approximately 511,000. It is the world’s only remaining Grand Duchy. It has the second highest Gross Domestic Product per capita ($84,829; IMF 2011) in the world. It is a founding member of ECSC (European Coal and Steel Community), European Union, NATO, OECD; it has been part of the euro zone since 1999. This shows its high interest in European integration. The small army often is the subject for a laugh: it consists of around 800 soldiers. There is no navy and no air force. Luxembourg is the host to 17 NATO AWACS airplanes, one A400M military cargo plane that are shared with Belgium, and 3 NATO Boeing 707.

Luxembourg is one of the smallest European countries, it measures 2,586 km², 82 km long and 57 km wide at its longest and widest points. Until the 1960 the steel industry was the engine of Luxembourg’s economy; after 1960, the banking and financial sector took over. The Luxembourgish language is a German dialect from the Mosel region, filled with French and Dutch words and expressions. Luxembourgish is one of the three national languages. In school, pupils speak and study in German, French, Luxembourgish, and may later study English, Portuguese and Italian. Luxembourg's total population consists of 511,800 inhabitants of whom 290,500 (56.76%) are Luxembourgers and 221,300 (43.24%) are foreigners (data from statec, 2011). During the day time, 138,700 cross-border workers come to Luxembourg to work: 74,100 French, 37,800 Belgian, and 37,500 German. This means a total of 357,800 for domestic employment. 357,800 people were working in Luxembourg in 2010, out of them 219,100 were residents and 138,700 were cross-border workers. 39% of the domestic employment consists of cross-border workers.

The capital of Luxembourg had approximately 94,000 inhabitants in 2011, 60% of whom were foreigners. During the day, this equation changes dramatically, as the work force is commuting into the town of Luxembourg from Germany, France and Belgium. The TGV link makes Luxembourg only two hours away from Paris. RTL (Radio Television Luxembourg) and SES ASTRA (Société Européenne des Satellites); European Skype, eBay and Amazon are headquartered in Luxembourg. Working in Luxembourg is described in detail by American Chamber of Commerce (2010).

There are 45,000 European civil servants, out of this number 9,500 are present in Luxembourg; this means 5.5% of the Luxembourg active population. 42.3% of the Luxembourgers are civil servants (IPSE, 2010). The European Institutions in Luxembourg are: Secretariat of the European Parliament,
European Council (2nd), Court of Justice and Court of Auditors. There are also: European Investment Bank, European Investment Fund, European Union Publications Office, and Eurostat. The European Institutions are distributed following: Brussels hosts the Commission, Council of Ministers, European Council (1st), Parliament (2nd). Strasbourg hosts the Parliament, Luxembourg hosts the Parliament (secretary), Council (2nd), Court of Justice, Court of Auditors. Frankfurt hosts the European Central Bank, see more information on the website of the Office for Official Publications of the European Union http://ec.europa.eu/publications.

There is very little research in general about Luxembourg. The existing literature is mostly descriptive (Background Note Luxembourg 2006, Dumont et al. 2008, paperJam). The most recent publication, in French, on history and politics in Luxembourg has been written by Haag (2011) and includes excellent photographs underlining his detailed historical overview. One recent publication is from IPSE (2010), in German, but it does not relate in any way to Hofstede's dimensions, nor does Spizzo's book published in 1995.

**LUXEMBOURG'S HISTORY**

Despite all the wars in Europe Luxembourg still survives. Despite all the requests from the European partners for fiscal homogeneity, despite the demands to abolish the borders and the ending of bank secrecy, and the exchange of information on bank accounts, Luxembourg still survives. Luxembourg is a small country, and it is strongly attached to the rock it is built on, like a medieval defensive city (Spizzo 1995).

Luxembourg has always stayed politically 'neutral'. This 'neutrality' has often been compared with Switzerland's neutrality. Luxembourg was able to stay neutral between its two mighty neighbouring countries, France and Germany. Therefore the 'privileges', namely, low direct and indirect taxes, low or non-existent income tax, work opportunities, low unemployment, high salary, cheap gasoline, cigarettes, alcohol, and more, are seen as a unifying identifier for the Luxembourgers. These privileges make the difference between the 'in-group' and the 'out-group' (Briley 2005), between 'being Luxembourger or not'.

After World War I the need was to assure national identity, to make people understand why it was important to be 'Luxembourgers', to give value to the concept of 'citizenship', and being a 'Luxembourg citizen'. Only when Nazism engulfed this small country, because to the Germans this small piece of land seemed to be German, did the linguistic aspect attain its importance.

History shapes the character of a nation. Haag (2011) states, that Luxembourg developed from a provincial town to a European capital, an international financial centre, and a worldwide freight centre. In 2008 the Clausen zone was created for entertainment, in 2005 the Philharmonic Orchestra
was inaugurated, the MUDAM in 2006 and the Congress Centre in 2012 (Haag 2011). The 2010 Mercier report puts Luxembourg in 20th position among 221 towns for its quality of life (Haag 2011 p. 541). Prominent European personalities, such as Robert Schumann, Jean-Claude Juncker, and Jacques Santer, are from Luxembourg (Haag 2011). RTL – Radio Television Luxembourg, SES Astra – Société Européenne des Satellites, and EIB – European Investment Bank - are important companies from Luxembourg (Haag 2011). Luxembourgers are trilingual, sometimes quadri-lingual or quinti-lingual, or command even more languages, as described in the following.

**CULTURE AND LANGUAGE**

The relationship between ‘culture and language’ has been studied by Kashima and Kashima (1998), testing the use of first- and second-person singular pronouns (‘I’ and ‘you’) in correlation with Individualism, and by doing so correlating language and culture. The relationship between ‘cultural background’, ‘language’, ‘geographic region’ and ‘ethnic identity’ was researched by Taylor et al. (1973). Lewis (2006) specializes in research on ‘language programming’ in relation to cross cultural leadership. Sherzer (2009) investigates the relationship between grammar and culture, where language conditions thought, perception and world view. Bi-culturals ability of frame switching through language has been researched by Briley et al. (2005) and Hong et al. (2000). Language has been identified as a manipulator of consumers’ behaviour (Briley et al. 2005; Hong et al. 2000).

As argued earlier, Luxembourg with its special Luxembourgish language as well as other official languages, and its unique demand for the command of Luxembourgish as a condition for citizenship, provides an appropriate background for testing the role of language as an identifier of culture.

Luxembourg’s language is described next, followed by the relevant hypotheses.

**LUXEMBOURGISCH LANGUAGE**

Today, 320,000 people are Luxembourgish native speakers. The Luxembourgish language (Spizzo 1995) has become the discriminating factor to distinguish between those who are able to benefit from Luxembourgish citizenship and those who are not. Luxembourgish possesses the characteristics of a dialect, proven by the fact that there is no translation of the Bible into Luxembourgish.

Luxembourgish is a spoken language and does not have a long written tradition (Spizzo 1995). The language defines the in-group (Briley 2005) and the out-group. Those who speak Luxembourgish are part of the in-group and those who do not speak the language are part of the out-group. Official documents are in French or in German. Mostly, French is used for bureaucratic issues, and German is used for the religious ceremonies. This dialect has become the discriminating element for citizenship.
In order to benefit from all of the advantages of the Luxembourgish nationality one has to be able to speak Luxembourgish. Citizenship is only awarded to people who speak Luxembourgish (Spizzo 1995). The language, therefore, provides access to the advantages and rights associated with citizenship.

Luxembourgish authorities are an example of long-term orientation; they were able to adapt and react to some of the crises in the steelmaking industry and in the banking system, always with the objective of guaranteeing stability and wealth for the people. It seems as if there was an invisible line of stability and wealth that was guaranteed throughout the centuries. Typical words for the national identity are wealth, privileges, stability through the maintenance of the attractiveness of the country compared to neighbouring countries, because of its industry, its labor market, its fiscal benefits, all key for the success of the country. Being part of this system and the feeling it gives is the glue of the country, the sense of being part of it (Spizzo 1995).

Following the description of Luxembourg and its culture, it is argued that Luxembourg’s dimensions of culture are not proxies for the average values found by Hofstede in France and Germany, but rather are unique and a result of Luxembourg’s language, which is also the official country language since 1984. The following hypotheses are offered:

Hypothesis 1: Native Luxembourgers scores on the PDI, UAI, IDV, MAS, LTO, IVR, MON cultural dimensions are significantly different from the scores of non-Luxembourgers in Luxembourg.

If hypothesis 1 is corroborated then the scores on Hofstede’s dimension should reflect a tendency of Luxembourgish native language speakers to score differently than the scores of French, German and Foreigners in Luxembourg. The following hypothesis is offered:

Hypothesis 2: There are significant differences between Hofstede et al.’s (2010) PDI, UAI, IDV, MAS, LTO, IVR, MON cultural dimensions estimates for Luxembourg and the empirical values found in this study for Luxembourgers with Luxembourgish Nationality.

HUMAN RESOURCE MANAGEMENT

Human Resources Practices have a historical background and have developed throughout the years (Armstrong 2009, Bratton and Gold 1999) and with the changing world of work (Krautand Korman 1999). Twenty years ago, Human Resources Policies were mostly related to Administration (Mahoney and Deckop 1986): salary, vacation, absence, work hours, headcount and accounting. In many companies, the accounting department was part of the Human Resources Department. Following this administrative trend, arrived a movement focused on motivation (Kuvaas and Dysvik 2009). Human Resources became centred on motivation of employees, recruiting, training, evaluation, and
recognition. More recently Human Resources (Gilley and Maycunich 2000) is driven by communication (English et al. 2007), (Bada and Madon 2006), international HR (McLean and McLean 2001), recruiting in the globalised HR world (Sparrow 2007) and networking (Tixier 2004, Slagter 2009).

Standard HRM is about recruiting and staffing best practices (Ryan et al. 2003), talent management (Tansley et al. 2007), HR administration (Mahoney and Deckop 1986), communication (Curtis et al. 1989) and e-HR (Lengnick-Hall and Lengnick-Hall 2006).

Martin and Reddington (2010) are developing a model of e-human resources, focusing on the relationship between HR strategy, e-HR goals and architectures and positive and negative e-HR outcomes in their publication “Theorizing the links between e-HR and strategic HRM: a model, case illustration and reflections.” Following Scandula and Williams (2000) it’s about “Research methodology in management, and about current practices, trends, and implications for future research.” Collins and Clark (2003) make the link between strategic HRM practices and social networks to deduc as a result the increase of performance. Marchington (2008) sees the following topics as main HRM topics: absenteeism, job satisfaction and relational co-ordination, global HRM, job and role design, recruitment, appraisal, the HR business partner model, and the role of HR in international mergers and acquisitions. Kuvaas and Dysvik (2009) write about “Perceived investment in employee development, intrinsic motivation and work performance.” Scullion et al. (2007) published “International human resource management in the 21st century: emerging themes and contemporary debates.” Tixier (2004) asks “Does the evolution of the human resources practices imply the implementation of an information system?” Slagter (2009) sees “HR practices as predictors for knowledge sharing and innovative behaviour: a focus on age.” HRM research also goes into strategic HRM (Mäklä et al. 2012) and Control systems that might prevent managers from unethical behaviour, because it gives them a feeling of being treated fairly (Langevin and Mendoza 2013).

SOCIAL NETWORKING TECHNOLOGIES

Following Boese 2009; Cross et al. 2003; Cross and Thomas 2009, Fernandez et al. 2000, HRM standard practices and e-HRM (Martin and Reddington 2010), digital social networks like LinkedIn, Facebook (Kirkpatrick, 2010) and Twitter have revolutionised human resources practices. Google has changed the way we see our world (Auletta 2009) and changes our habits (Jarvis 2009), and the internet does modify our brain (Carr 2010). Some even wish to make the internet stop (Zittrain 2009). Due to the social technologies, we have to reconsider how we can live and win in a transformed world (Li and Bernoff 2008), and how we interact in times of Facebook (Stengel 2010), where the new digital generation grows up with naturally, contrary to the generations before them (Tapscott 2009).
Historically, Barnes (1954) was the founder of the definition of social networks and his research dates back to 1954. This study was followed by works from Rees (1966) on information networks in labour markets, and by Milgram (1967), who tested the “small world”. De Schweinetz (1932) was the forerunner of economists and sociologists who distinguished between the formal and the informal methods used to find a job. Granovetter (1973, 1985, and 1995) studied the informal methods of finding a job according to him, discovering the “forces of the weak ties”.

Sammartino McPherson (2009) describes Tim Berners-Lee (2000) who imagined a world wide web, encouraging social interactions, giving people without huge technical competences and knowledge the possibility to publish online content, free of charge, unlimited in space and time and the opportunity to interact with others.

The research paper from Hasgall and Shoham (2007) is “Digital social network and the complex organizational systems”, where social networks in organisations are viewed as a shared knowledge system backed by management.

An interesting article is to be found from Jones (2010) about how to use Twitter, Facebook and LinkedIn in recruitment. Boese (2009) writes about standard HRM practices and social network analysis.

In the view of Shirky (2009 and 2010) people go through different stages of “Gin, Television and Social Surplus”. Firstly, they meet in pubs for a drink and later they spent their free time watching TV. Next, they reach the phase where they like to share and communicate, to produce and not only to consume.

Following Tapscott (2009) the reluctance for the use of new technologies lies within the generation gap. He describes the “Net-Generation” as learners who are rethinking talent and management, and who are in networks and in families.

Hypothesis 3:

Hypothesis 3: HR specialists in Luxembourg are reluctant to utilise new social networking technologies due to their specific cultural identity. As a result, the practical techniques used related to recruiting, integration, evolution, training, talent management and the evaluation of employees remain largely unchanged. This hypothesis is based upon an assumption that needs to be justified.

What causes this reluctance? Specific cultural facts, differences in nationalities, or age, or gender or other facts (Fisher and Howell 2004, Reddington et al. 2010)? What has been the extent of the use of new social networking technologies in Luxembourg? Why have human resources specialists in
Luxembourg been reluctant to utilise new social networking technologies? How do they do HRM? How to make them use the new technologies?

My work engages in debates resulting from my review of HRM Practices in general, based on relevant literature, ERP (Lengnick-Hall and Lengnick-Hall 2006) and theory in comparison to the practices currently in use. My work will show that Luxembourg is different from other markets, confirming Greenwald and Kahn’s (2005) “All Strategy is Local”. Luxembourg has a specific work environment that is not in-line with the theories of the globalised world (IPSE 2010, AmCham 2010).

- Which standard HRM practices (Kuvaas and Dysvik 2009; Marchington 2008) in recruiting, evaluation, information gathering, training, outplacement were typically used in the past by Luxembourg companies and are still used?
- When used, which social networking technologies do companies prefer and how does their use impact performance (Collins and Clark 2003)? A look into the past and into the future of Networking in Luxembourg.
- Is the local use of these Social Networking Technologies affected by cultural specificities (McLean and Campbell 2003), (Scullion et al. 2007) or age (Tapscot 2009)? What is the impact of the specific cultural identity and language (Jameson 2007)?

METHODS

Respondents

- Collecting primary data via Participant Observation, following Saunders et al. (2009), Strauss and Corbin (2008), Taylor and Bogdan (1998), Wilson (2010): participation at seminars, conferences, meetings, dinners, breakfasts, networking events, organised by: e.g. hrone, POG, AmCham, Chamber of Commerce, Sacred Heart University, IGS, Recruitment Matters (http://www.recruitmentmatters.com/news/newsletter/index.html), in e.g. Hotel Sofitel, Hotel Hilton, BGL BNP Paribas, Banque de Luxembourg, Dexia…
- Collecting primary data via Face-to-Face Interviews and questionnaires with e.g. Luxair, HSBC, Deloitte, euroscript, Lindab, RTL, European Investment Bank, ZithaKlinik, Ernst & Young, Banque Privée Edmond de Rothschild, Cactus, Delphi, fast, aims, Rita Knott Consulting, Thierry Ernst Consulting, Ville de Luxembourg, Municipality of Sanem, University of Luxembourg, Ketterthill, Soludec, SES Astra, John Zink, Paul Würth, Centre de Recherche Public Henri Tudor (2008), Office des Publications de l’ Union Européenne, KPMG, Oostvogels, Equity Fund among others, in total 41 companies. Case study with ZithaKlinik and Centre de Recherche Public Henri Tudor
Collecting primary data via Hofstede’s original questionnaires in one company: Lindab Buildings, Diekirch.

**Instruments**

- My questionnaire has been used in paper and online to enquire about HRM practices and the impact of digital social networks on these HRM practices in Luxembourg and Hofstede’s (2001) original questionnaire has been used to measure his cultural dimensions. The questions concerning HRM practices are: (1) ‘What means is your company using in recruiting?’ (2) ‘Which digital social networks does your company use?’ (3) During the recruitment process, how does your company gather information about a candidate?’ (4) After the recruitment process, how does your company gather information about its employees?’ (5) ‘What are the advantages of digital social networks?’ (6) ‘What are the disadvantages of digital social networks?’ (7) ‘Did the use of digital social networks change the role of the human resource specialists in Luxembourg? If yes, how? If not, why not?’ (8) ‘Do you see any risks, dangers while using digital social networks in the human resource practices of recruiting, evaluation, evolution, training…’ (9) ‘Which internet pages are accessible in your company? (is Facebook accessible?’ (10) ‘How is networking mainly done in Luxembourg?’

- Excel is used to come up with the graphs resulting from the above questions.
- Nationality does not always correspond to native language and therefore questionnaires were distributed in English, French and German.
- A pilot study was conducted to pre-test the questionnaire’s face validity.
- As ethical concerns may emerge at all stages of the research (Elms et al. 2010), precautions have been taken to ensure confidentiality. Questionnaires have been anonymous. Equity in treatment regardless of gender, race or nationality was always guaranteed (Robertson 2008).
- Hofstede’s (2001) original questionnaire has been used to measure his cultural dimensions. Questions have been added to measure respondents’ happiness and background information.
- After the initial screening and cleaning of the collected data, Hofstede’s (2010) original formula, were used to calculate Hofstede’s cultural dimensions **Power Distance Indicator (PDI)**, **Uncertainty Avoidance Indicator (UAI)**, **Individualism-Collectivism (IDV)**, **Masculinity-Femininity (MAS)**, **Long-Term Orientation (LTO)**, **Indulgence Versus Restraint (IVR)**, **Monumentalism (MON)**. Pearson Correlations were calculated among all variables.
- One question was used to measure Happiness: "Are you a happy person always, usually, sometimes, seldom, or never?"
The following Demographic data served as control variables: native language, command of other languages, gender, age, hierarchical rank and education. Age was measured in an eight-point scale, educational background and rank were measured on a seven-point scale.

RESULTS

Human Resource Managers in Luxembourg are reluctant to use digital social networks, due to their cultural identity. Human Resources practices have a historical and cultural background and has developed throughout the years. The recruitment sector has been revolutionised by Facebook, LinkedIn, Xing, Twitter and Blogger, but not so in Luxembourg. This is given by the high score in ‘Uncertainty Avoidance’ following Hofstede.

The means used in recruiting are mainly advertisement in newspapers (25) and spontaneous applications (23). Digital social networks (8) are far the less used mean in recruiting, see the following table.

Table 1

</tr>
</tbody>
</table>

When companies use digital social networks, they mainly use LinkedIn (20), followed by Facebook (12), Newsletter (10), and Xing (9), see the following table.
During the recruitment process, companies gather information about the candidate using mainly the CV (36) and the Interview with the candidate (35). Friends (6) and digital social networks (7) are the least used means, see the following table.

After the recruitment process, companies gather information about an employee mainly through discussion with the employee (35) and the annual performance evaluation (21). Friends (2) and digital social networks (3) are the least used means, see the following table.

How networking is mainly done in Luxembourg is shown in table 5. This shows that most networking is done through private contacts, (37), followed by meetings, events, seminars (33), clubs and associations (25) and leisure (19).
What are the advantages of Digital Social Networks? was answered as follows:

- Growing its network, connecting to former colleagues or friends where you lost contact
- Increases network, spreads brand awareness, no cost
- (Re) connecting to people; discover other social network forms. Contacting people without facing or calling them. Timeless networking (anytime in day and night)
- It can help to find someone who can answer you a specific question. Especially LinkedIn is very useful there
- The world just got smaller!
- Easy to use and to find information you need
- Quickly found information
- It gives you a first impression to be confirmed or not
- I have 2 daughters: 24 and 22 years old who are on Facebook, with the style of live of the students’ live, Erasmus contacts, their way of keeping contact in the entire world, with students they didn’t see for some months. To find back friends that one wishes to find back. To exchange information.
- Faster creation of a network, widening of one’s network
- Broad database, normally quite actual information
- Big space of information, fast work, easy communication
- Accessibility, information available quicker
- Being able to reach fast a number of people whom I couldn’t contact by any other means. Our site: “Your future at Deloitte”: We find them at their homes, they don’t need to move. The number of people! The different profile of the people, their diversity, the entire world, the
In your opinion, what are the disadvantages of Digital Social Networks? was answered as follows:

- None
- Low quality
- If you allow too many details to be shown to public users there might be a lack in privacy
- People may lie about their experience, job title...
- Lack of personal touch
- Very little usage potential for finding the right staff. People tend to exaggerate their skills and don’t talk about deficiencies. Endorsements might help a bit, but when you look at them they don’t seem to be more than a friendly turn.
- It’s not always easy to control if information found is trustfully
- No confidentiality
- No control on distribution of information
- Private info, not always accurate
- The content is not trustful
- It is an advantage and a disadvantage: fast communication, a lot of information
- The contact has to be private, personal. I don’t want to make public what is private. It’s the illusion of transparency. In the world of the companies, one has to be transparent, that means invisible. Therefore one doesn’t say the truth anymore.
- To share too much information with everyone. The 1st degree of this kind of network.
- Not confidential enough, sometimes too transparent
- If not used properly, may lead to abuse. Private data access. Information posted may not be 100% accurate
- One can create a profile that isn’t true. One can create an identity without being it. As recruiter one tries to get known. You have to control the posts, not to allow dialogues politically not correct. One has to manage this every day.
- I am not really up to date to reply to this question.
- Information is not as complete as a CV.

world is getting very small.
- A lot of information is available. Fast.
- Contact passive candidates.
- Contact candidates out of location.
Do you see any risks, dangers while using Digital Social Networks? was answered as follows:

- Lowering of Quality
- No – Which ones?
- We talk about the professional environment, right? Then I don’t see many risks. The situation is different of course for tools like Facebook etc where people show pictures that the world shouldn’t see and that are impossible to delete.
- The main risk is that it is so easy to use / make contact that there is a temptation to leave “face-to-face”-contact by side
- See disadvantages
- Preservation of private life
- Of course, there are risks associated by using DSN but it doesn’t affect on recruitment process
- Yes, it can not be your only resource.
- This mix of private life – professional life. Facebook has a non-stop memory. You cannot delete the memory of Facebook. Even if I have nothing to hide, I don’t want to show it to everyone.
- The limits of the network: “ok, we are linked, yes, and what now?” The weak border between the private and the professional.
- Reliability of information, respect of personal data, standard demand driven streamlining of data, over-simplification of search = interesting profiles not taken into account
- Risks in confidentiality. Risks of copies. Risks of discretion.
- Yes: reputation. Information is spread fast, without control. Not to be deleted: it is on the net, it will stay there forever.
- Privacy. Not suitable photos.
- Approach people not matching our requirements/criteria.
- No, very helpful too, especially for HR people

The below correlation matrix shows that Luxembourgers are characterised for being long term oriented, they indulge in life, they are uncertainty avoidant, and they are happy.

The figure above closes this chapter on data analysis. The next paragraph is on limitations of this study.

LIMITATIONS

Thus, the comparatively small sample size, the data collected only in one company, and the lack of a strong theory to link culture and happiness, could all have biased the results and their interpretations. Yet, it is likely that scores that were found to be significant in a small sample are likely to be made even more significant in a larger sample. Also, focusing on one small country and one company has provided the opportunity to indirectly control for many exogenous variables that otherwise would have the potential to 'contaminate' the relationships between the variables. The next paragraph is on discussion and implications.
DISCUSSION AND IMPLICATIONS

The purpose of this study was to explain, in this world of global mobility, the cultural and language characteristics of Luxembourg that may influence the tendency of human resources specialists in Luxembourg to utilise new social networking technologies such as LinkedIn, Viadeo, Xing, Facebook and Twitter. Increasingly global mobility (Tahvanainen et al. 2005), more collaboration across borders (Hinds et al. 2011), strategy in global staffing (Collings et al. 2007), complexity, struggling the work-family balance (Shaffer et al. 2001), trust building (Harvey et al. 2011), career consequences (Shaffer et al. 2012) this research is interesting for expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, trying to cope with the cultural and linguistic specificities. Tharenou (2005) finds out the main reasons why people accept expat work: money, professional development and challenging content; and why people won’t accept expat work: family commitments and disruption.

The study is the result of the link between literature on standard HRM practices, e-HRM (Martin and Reddington 2010) and practice in Luxembourg business life (IPSE 2010, AmCham 2010). It provides an answer for HRM specialists to the question: “How to be successful in multicultural, international Luxembourg?” Cultural identity, intercultural communication, language and international business are discussed by Jameson (2007). How to do business with social networks in international trade (Rauch 2001)? HR Managers will be made aware of the usefulness of digital social networks and may potentially implement them into their current HRM Practices (Guler and Guillen 2010).

The aim is to analyse Luxembourg and its way of business while continuing to evolve with changing technologies. The questions discussed go deep into the analysis of everyday business life, cultural identity, language and international trade in Luxembourg (Horner 2009, Kingsley 2009, Davis 2009). One must genuinely accept and understand the meaning of “Mir wëlle bleiwe wat mir sinn”. If one does not make an effort to integrate into Luxembourg’s specific business culture, success in Luxembourg may never be possible (Background Notes 2006; Neefs and Laures 2010).

By employing a unique sample that includes respondents who speak French, German and Luxembourgish in France, Germany and Luxembourg this study has managed to corroborate the notion that language is a good identifier of culture. While scores in this study for French and Germans in France and Germany resemble to a great extent Hofstede’s scores for these two countries, and while scores in this study resemble Hofstede’s estimates for Luxembourgers who speak any official language of the Grand Duchy, Hofstede’s estimates varied to a great extent from this study scores for Luxembourgers who command Luxembourgish as their mother tongue. This is a unique testimony for the relationships between language and culture, while controlling for country.
Some proven relationships between culture, represented by such dimensions as Long Term Orientation, and high level of Indulgence, and happiness, have been corroborated in this study. It is self evident that two measures, that measure similar concepts, namely, Indulgence on a national level and Happiness on the individual’s level should be related to each other. The Grand Duchy’s political, social and economic stability allows people to plan for the long term, thereby providing support for people's need for security and life predictability. It is possible that this is the key for the relationship between Long Term Orientation and Happiness in Luxembourg found in this study. To validate this argument it is worth citing Hofstede himself: "At 70 Luxembourg has a high score on uncertainty avoidance which means that as a nation they are quiet reluctant to test unknown territories. Security is a key word in Luxembourg; there is not one activity which is not depending on some sort of security control from authorities; from banker’s money to safety exits in a restaurant. It makes the live in Luxembourg very safe, but some would argue a bit boring. New ideas, new methods, new management techniques must first be proven to work in other countries in order to be accepted in Luxembourg. Historically more “farmers” than “traders” the inhabitants kept that good old “common sense” made of cautiousness which has proven to be profitable for a country who managed not to be at war since the Napoleonic time! (http://geert-hofstede.com/luxemburg.html). Since this is the first time that such efforts are being made to find the relationship between happiness and culture, those results should be taken cautiously.

Not surprisingly, Indulgence was found to be significantly related to Individualism and Masculinity, two concepts that are part of Indulgence definition. The significant relationship between Indulgence and Monumentalism, and the significant negative relationship between Monumentalism and age, may indicate that younger people tend to be more individualistic, monumental and, therefore, happy. This hypothesis could only be corroborated by enlarging the sample size, a fact which would allow conducting more sophisticated statistics than mere correlation.

This research could be used by expat-Managers, HR professionals, recruiters, head-hunters and HR directors in Luxembourg and globally wishing to collaborate with Luxembourg, who would like to consider evolving technologies and their potential use in Luxembourg’s business environment with its cultural identity (Jameson 2007) in international trade (Rauch 2001).

FUTURE RESEARCH

Future studies could focus on strategies and challenges of global human resource management, researched by Ananthram and Chan (2013) concentrating on the challenges they enumerate: degree of standardisation of HR, foreign industrial relations, labour laws, time zones, cross cultural differences and cultural sensitivity, leadership development, communication, expatriates’ adjustments,
inflexibility and work-family balance (Ananthram and Chan 2013), and evolve further into the two branches of the current research: first, focus on the relationship between language and culture and empirically validate it for other languages. Thus, in-country studies comparing the dimensions of culture could be conducted in places such as Switzerland that contains four official languages, in Germany where a minority command Turkish as a mother tongue, or even in China where the people of the south command Mandarin while the people of the north command Cantonese, and yet they all belong to the same Hun group. A second possible avenue for future research could focus on the influence of culture over people’s happiness. Since a new cultural dimension, namely Indulgence, is now available, happiness could be measured at both the national culture level and the individual’s state of mind. Expansion of the current research model and the use of its instruments in a number of other organizations and countries have the potential to strengthen the validity of the current research findings by generalizing them over new populations, and by making them more specific. In any case, be it the study of language and culture or culture and happiness, larger samples would allow for the application of more sophisticated statistical methods, such as regression models, that would allow the exploration of the relative influence of language over culture, and cultural dimensions over happiness. Thus, despite its limitations, the current study has paved the way for major replications and refinements and the substantiation of very important hypotheses that have theoretical as well as practical implications for researchers, managers and others, across the globe.

In this world, where millions of people migrate from one country to another, and where communities become greatly diverse, the ability of the use of countries’ national boundaries as the fault lines that define culture dimensions, to explain and predict management and other societal behaviours, is very limited. Students of culture should make it their habit to measure social units’ cultural dimensions by varying the respondents across languages, and maybe even across dialects, rather than across common national boundaries.

WHY NETWORKS, A SHARED LANGUAGE AND STORYTELLING HELP ORGANISATIONAL ADVANTAGE IN MICROFOUN丹SATIONS – INTERNATIONAL ENVIRONMENTS AND STRATEGIC HUMAN RESOURCE MANAGEMENT

Schinzel, Ursula

United Business Institutes, Luxembourg

ABSTRACT

This research, based on Nahapiet and Ghoshal (1998), investigates why networks, a shared language and storytelling help organisational advantage in microfoundations in international environments, especially in Strategic Human Resource Management (SHRM). The first part of this paper is dedicated to an in-depth literature review. In the second part, the research method is explained: survey questionnaires were developed based on Nahapiet and Ghoshal (1998), translated from English to French and German and distributed. The questionnaire consisted of 28 closed questions on a five-point Likert scale and two open questions regarding networks in person or digital networks, producing many direct quotes from the respondents. A total of 253 questionnaires were collected, out of which 246 were usable. One interview was conducted for the purpose of this research, with the objective to validate the results from the questionnaires, but it was not included into this paper. Further research could focus on qualitative research methods, as well as the influence of new media and age. In the third part, the findings of this research are presented: Networks provide access to information, are easily accessible, flexible and efficient, diverse, they are fast, cheap, “Who you know” determines “What you know”, there are obligations, norms, and expectations within a network, and there are issues with trust and confidentiality in networks. Some HR managers have a preference for networks in person compared to digital networks; their respective arguments are presented. A shared language is used as identifier as it defines the in-group and distinguishes from the out-group, is important in social relations, enables people to discuss and exchange information, to ask questions, to conduct business, creates group-specific communication codes, enables the combining of information, the development of new concepts and the creation of new knowledge, and influences our perception. If people do not speak the language, they are kept apart and have restricted or no access to information. Storytelling is used to show and transmit values, norms, and culture, to share knowledge and understanding, it is useful in education and training, it helps to communicate quickly, naturally, clearly; with storytelling one can focus on a vision and plan the future, solve
problems and conflicts, inspire continuous innovation, manage change, and make decisions. It is proposed that networking, in person and in digital form, a shared language as identifier and storytelling are capabilities for shaping the future and success of microfoundations in international environments. Conclusion and discussion, limitations, further research, and references follow.

**Keywords:** Strategic Human Resource Management (SHRM), networks, storytelling, language as identifier, international entrepreneurship, microfoundations

**INTRODUCTION**

This research, based on Nahapiet and Ghoshal (1998), investigates why networks, a shared language and storytelling help organisational advantage in microfoundations in international environments, especially in Strategic Human Resource Management (SHRM). Survey questionnaires, developed by the author based on Nahapiet and Ghoshal (1998) and consisting of 28 closed and 2 open questions were used to determine the extent of influence of success in microfoundations in international environments. 246 usable questionnaires were collected and one interview was conducted, to validate the findings from the questionnaires. However, the interview was not included into this paper. Practical advice is offered to HR managers of how to use these means for organizational advantage in microfoundations in international environments.

The literature review that follows this introduction concentrates first on microfoundations, second on Human Resource Management, globalisation and e-HRM, third on networks, forth on digital social networks, fifth on language as identifier, and finally on storytelling in organisations. The literature review is followed by the methods chapter [[are you sure “part” is the right word?]]. The results follow the methods chapter. The findings to the research questions are presented: Why do you think networks, a shared language and storytelling help organisational advantage in microfoundations? The additional research question is: “Do you prefer networks in person to digital networks like Facebook, LinkedIn, and Twitter?” Findings are presented, issues with networks in person and with digital networks are shown, and reasons why respondents would prefer networks in person or digital networks are demonstrated. Conclusion and discussion, research limitations, and future research follow.

**LITERATURE REVIEW**
MICROFOUNDATIONS

Microfoundations have gained in influence in strategic management over the last years. Individuals have a basic influence on strategic management, is the argument. Strategic human resource management is one field of research interests besides economics, psychology, sociology, motivation, cognition, marketing, strategy, entrepreneurship, communication, and others. Foss (2010, p. 12) defines microfoundations as “foundations of something, namely aggregate concepts and/or relations between aggregate variables”, ... it is “an instance of reductionism”, ... “of how individual decision-making influence firm behaviour”. The discussion between “methodological individualism” versus “methodological collectivism” goes “whether individuals (“micro”) or social collectives (“macro”) have explanatory primacy”.

The interest in the theory of the firm started nearly 40 years ago now. The theory of firm scholars focusses on the causes of “organisational advantage”, contrary to its failure (Nahapiet and Ghoshal, 1998, p. 242). They include trust, networks, network ties, network configuration, shared narratives and shared language and codes in their research of the organisational advantage. They see the roots of intellectual capital in the social relations and structures - “who knows who” affects “what you know”.

In strategy, Porter (1996) was the pioneer, initiating a loop of decade-long discussion and theory on business structures, procedures and performance, slowing down any positive development (Teece, 2007). Teece says (2007, p. 510) “Fortunately, the existing literature on strategy, innovation, and organization and the new literature on dynamic capabilities have identified a panoply of processes and routines that can be recognized as providing certain microfoundations for dynamic capabilities.”

He says that new opportunities are sensed through scanning, creation, learning, and interpretive activity. “Opportunities get detected by the enterprise because of two classes of factors. First, as stressed by Kirzner (1973), entrepreneurs can have differential access to existing information. Second, new information and new knowledge (exogenous or endogenous) can create opportunities, as emphasized by Schumpeter (1934)”.

This chapter finishes with the call of Teece et al. (1997, p. 530): “Researchers in the field of strategy need to join forces with researchers in the fields of innovation, manufacturing, and organizational behaviour and business history”. The next chapter is on HRM with a focus on today’s challenges, globalisation, and e-HRM.

HUMAN RESOURCE MANAGEMENT, GLOBALISATION AND E-HRM

HR practices have developed throughout the years (Armstrong, 2009) and with the changing world of work (Scholz and Böhm, 2008). Twenty years ago, HR practices were mostly related to administrative issues such as salary, vacation, absence, work hours, headcount and accounting. In many companies,
the accounting department was part of the HR department. Following this administrative trend a movement that focused on employees’ motivation, recruitment, training, evaluation, talent management and recognition (Kuvaas and Dysvik, 2009).

More recently HRM is driven by communication, international HR, Strategic HRM, global HRM and recruitment in the globalised world, migration and geographical (im)mobility and networking and e-HRM (Stone and Dulebohn, 2013).

Rising staff mobility, including short-term international assignments in multinational companies and transfers, commuters, as well as rotational, contractual and virtual assignments, brings increasing complexity, fragmentation of employees’ careers, the taking on of responsibilities and encountering challenges never thought of previously (Shaffer, 2001, 2012), increasing networking, and e-HRM. e-HRM influences all HR activities and their usage, through cost reduction, decision-making, IT system, and IT security. e-HRM focuses on the relationship between HR strategy, e-HR goals and architectures and positive and negative e-HR outcomes (Martin and Reddington, 2010). e-HRM influences human resource planning, recruitment, selection, performance management, work flow, training, compensation, and performance cost reduction, strategic HRM (Collins and Clark, 2003; Porter, 1996), change in usage, including training, especially e-learning, decision-making, and information systems combined with IT security. The next chapter is on networks with a focus on digital social networks.

NETWORKS

Networks provide access to resources (Nahapiet and Ghoshal, 1998, p. 246), networks are an important source and determine information benefits. Networks - “Who you know” determine “What you know”. There are three forms of information benefits: access, timing and referrals. Networks provide efficient screening and distribution of information and knowledge. Networks allow speed in getting the right information. Networks allow people in the network the opportunity to provide, combine, exchange information and also give referrals with the information. Nahapiet and Ghoshal (1998, p. 252) state this reputational endorsement influences the value of the information.

Networks come in different forms, either in person or in digital form. Granovetter (1973) identified the role of the “loose ties” in information exchange in networks. These ties allow the transmission of information. The network structure depends on its density, connectivity, hierarchy, flexibility and ease of information exchange and the accessibility for the network members to the information (Nahapiet and Ghoshal, 1998, p. 252). The lower costs of accessing information through networks, especially through digital networks, are one of the advantages, besides the diversity and efficiency of the network information structure.
DIGITAL SOCIAL NETWORKS

Digital social networks like LinkedIn, Facebook (Kirkpatrick, 2010) and Twitter have revolutionised human resources practices (Cross and Thomas, 2009). Google has changed the way we see our world and our habits (Auletta, 2009), and the internet has modified our brain (Carr, 2010). Some even wish to stop the use of the internet (Zittrain, 2009). Due to the social networking technologies, we have to reconsider how we can live and win in a transformed world (Li and Bernoff, 2008), and how we interact in times of Facebook (Stengel, 2010), where the new digital generation of digital natives grows up, contrary to the generations before them. Tapscott (2009) has identified the reluctance to use new technologies as a result of the generation gap. He describes the “Net-Generation” as learners who are rethinking talent and management, and who are in networks and in families.

Social networks in organisations are viewed as a shared knowledge system backed by management, as standard HRM practices and social network analysis (Boese, 2009), and used especially in recruitment (Jones, 2010).

“The internet is among the few things humans have built they truly don’t understand. The internet is the largest experiment of anarchy in the history” (Schmidt and Cohen, 2013, p. 3). “Think of all the websites visited, ... of every job found, ... consider what the lack of top-down controls allow: the online scams, the bullying campaigns, the hate-group websites and the terrorist chat rooms. Through the power of technology, age-old obstacles to human interaction, like geography, language and limited information, are falling” (Schmidt and Cohen, 2013, p. 3). “Communication technologies will continue to change our institutions from within and without” (Schmidt and Cohen, 2013, p. 11). The benefits of networks are efficiency, flexibility, accessibility, diversity of information, low cost, high speed, “Who you know” determines “What you know”. Issues with digital networks relate to confidentiality, obligations, norms, and expectations within a network, the trustworthiness of the network members and the information provided. The next chapter is on language and especially on language as identifier.

LANGUAGE AS IDENTIFIER

Language is used as identifier. It is used to determine the “in-group” and to distinguish it from the “out-group” (Briley et al., 2005, p. 353). The ability of bi-cultural people of frame switching through language has been researched by Briley et al. (2005) and Hong et al. (2000). Language plays an important role in social relations, in exchange, sharing of context, transfer of information, conception, perception and knowledge creation (Nahapiet and Ghoshal, 1998, p. 253). Nahapiet and Ghoshal (1998, p. 253) suggest a shared language has three ways of influence on exchange: first on social relations, second on perception, and third enhances the combination capabilities. For the first point, a
shared language enables people to “discuss and exchange information, ask questions, and conduct business in society”. In cases where people do not speak the language, they are kept apart and have restricted or no access to this information. This is because first, a shared language is linked to our social relations, it is about “who knows who” – “who knows what” – “who speaks what (language)”. Second, a shared language is important for the development of new concepts, of new knowledge. The shared communication codes are important for the combination and transmitting of information. Third, a shared language influences our ways of perception. Our awareness is influenced by our language.

Benefits of a shared language are “defines the in-group, distinguishes from the out-group”, creates group-specific communication codes, is important in social relations, is used as identifier, enables the development of new concepts and creating new knowledge, enables the combining of information, enables people to discuss and exchange information, to ask questions, to conduct business, influences our perception, and if people do not speak the language, they are kept apart and have restricted or no access to this information. The next chapter is on storytelling, more precisely the use of storytelling in organisations and its benefits.

**STORYTELLING IN ORGANISATIONS**

Storytelling is used in organisations for many different purposes. These range from communicating a complex idea to solving problems, making decisions, planning for the future, (Denning, 2011) and training (Davidson, 2004). It is also used to state the organisation’s norms, values and the culture, to disseminate knowledge, to manage change and to focus on a vision (Boyce, 1996; Boje, 2008).

Following Denning (2004, p. 44, p 150-153) the objectives of storytelling in organisations are 1) to communicate a complex idea and to spark action, 2) to communicate who you are, 3) to transmit values, 4) to get people working together in a group or community 5) to tame the grapevine or neutralize negative gossip, 6) to share information and knowledge, 7) to lead people into the future.

For Denning (2011) and Clark (2004), storytelling is a tool to achieve business purposes.

There are a number of different approaches to developing profiles to help people plan their future work with storytelling. Some approaches examine the high-value forms of organisational storytelling: communicate complex ideas, communicate who you are, transmit values, promote team work, stop rumours, share information and knowledge and lead people into the future (Denning, 2011; Sharp, 2000), to manage conflicts, address issues, resolve conflict and face challenges, and to lead more efficiently (Friedman, 2009). This is how Coca-Cola uses stories to build stronger emotional bonds, for example with the “Happiness Factory”.

The Future of Entrepreneurship
Stories are beneficial for organisations, they are mainly used to inspire success. By telling stories, there is a connection with the audience, storytelling makes the audience involved and excited, which may not have been the case otherwise. It helps the younger generation to learn, to access and to connect with tradition. Stories are beneficial in education and learning (Davidson, 2004). The internet is used to tell stories (Paula Kahumbu, interviewed by David McKenzie. (http://edition.cnn.com/2012/10/01/world/africa/paula-kahumbu-kenya-lions/index.html?eref=edition). Stories tend to stick in the mind longer than abstract ideas alone (Heath and Heath, 2008).

Scholz and Böhm (2008) investigate human resource research in Europe with the objective of avoiding fatal and expensive mistakes. Valid for Europe, this is even truer for the world. Information on the different socio-economic, political and cultural conditions in the world could contribute to better understanding between counterparts. Personality, culture and human nature are the three levels of uniqueness in mental programming. Stories, again, could help prevent misunderstandings between cultures.

**METHOD**

Survey questionnaires were used to determine the extent to which networks, a shared language and storytelling influence the success of microfoundations in international environments. A standardised questionnaire was developed, based on Nahapiet and Ghoshal (1998), consisting of 28 closed questions in form of a five-point Likert scale and 2 open questions, producing many direct quotes from the respondents. The questionnaire consisted of five parts: (1) Assessment of the organisational advantage of networks, (2) of a shared language, (3) of storytelling, (4) two open questions on the preference of ‘networks in person’ to ‘digital networks’, (5) questions on personal data such as job, industry, gender, age, native language, other languages spoken, nationality, birth nationality, residency, origin, and education. The original English version was translated by native speakers into French and German and back-translated into English for validity check. Over the summer of 2013, they were distributed to business people in Luxembourg and Germany and to participants at different academic conferences. This explains the high percentage of doctorates in the sample. One interview was conducted to confirm the validity of the questionnaire’s results, but it was not further evaluated for this research. Future research is necessary to do so.

**RESULTS**

The results of the questionnaire are shown in the following chapter. A five-point Likert scale was used and average, median, minimum and maximum per question were calculated.
The first question: **“Why do you think Networks help organisational advantage?”** was answered as follows: the highest average score was for the answer “Provide access to information” with an average of 4.29 out of 5. The second highest score went to the answer “Accessibility, easy access to information, flexibility and efficiency” with an average of 4.01 out of 5. The third highest score was to the answer “High Speed (Timing) to this information” with 3.94 out of 5. “Low cost of access to information scored with 3.83 out of 5 came in fourth place. “Who you know” determines “What you know” (brings together information from different sources and disciplines)” scored 3.74, “Diversity of information” scored 3.69, “There are obligations, norms, and expectations within a network” scored 3.57, “Trust (trustworthiness of the network members and the information provided)” scored 3.46, and last place took “Confidentiality” with 3.06 out of 5. The median for nearly all questions was 4, although the median score for “Trust” was 3.5 and “Confidentiality” was 3. The current discussion on confidentiality, espionage, listening and recording of all digital information finds its confirmation here. Minimum was 1 and maximum was 5 for all responses.

The second question: **“Why do you think a shared language helps organisational advantage?”** was answered as follows: The highest average score was for the answer “A shared language is important in social relations” with a score of 4.24 out of 5. The second highest score went to the answer “Enables people to discuss and exchange information, to ask questions, to conduct business” with an average of 4.20 out of 5. The third highest score was to the answer “A shared language is used as identifier” with an average of 3.97 out of 5. “Creates group-specific communication codes” scored 3.90, “Enables the combining of information” scored 3.74, “Enables the development of new concepts and creating new knowledge” scored 3.68, “Influences our perception” scored 3.66. The lowest average score was 3.62 for both “Defines the in-group and distinguishes from the out-group” and “In case people don’t speak the language, they are kept apart and have restricted or no access to information”. The median was 4 for all responses. Minimum was 1 and maximum was 5 for all responses.

The third question: **“Why do you think Storytelling helps organisational advantage?”** was answered as follows: The highest average score was for the answer “Show and transmit values, norms, and culture”, with an average of 4.07 out of 5. The second highest score went to the answer “Share knowledge and understanding” with an average of 3.99 out of 5. The third highest score was “Useful in education and training” with an average of 3.84 out of 5. “Communicate quickly, naturally, clearly” scored 3.72, “Focus on a vision” scored 3.59, “Solve problems and conflicts” scored 3.47, “Inspire continuous innovation” scored 3.45, “Manage change” scored 3.37, “Focus and plan the future” scored 3.31. The lowest score was for the answer “Make decisions” with an average of 3.17 out of 5. The median was 4 for most responses, with a 3 for “manage change”, “focus and plan the future” and “make decisions”. Minimum was 1 and maximum was 5 for all responses.
The two open questions produced many direct quotes from the respondents. Here is what respondents said: The question: **“Do you prefer Networks in person to Digital Networks like Facebook, LinkedIn, and Twitter?”** was answered as follows:

201 prefer networks in person, 57 respondents prefer digital networks, 12 say both are important.

Respondents who say both networks are important, have no preference, as both have advantages and disadvantages. Here is what some of the respondents said:

“I use both – they both have their advantages and disadvantages, preferring the personal contact that allows me to use also “other channels” than the digital way.”

“I believe that it may be important to distinguish between a) being introduced to the network or creating a network and b) the consequent network contact. If a) then I would prefer networks in person since I get a better sense of other people by seeing them in person and talking to them face-to-face. But if it is an ongoing network with people who I already “know” then it really doesn’t matter”.

“I prefer to better know the people in my network – by meeting them I can assess their knowledge, motives, trustworthiness and the quality of the information we can exchange. Digital networks have the potential to be less trustworthy and potentially less useful. The best solution is combination of networks that provides opportunities for face-to-face contacts and digital network contacts.”

Respondents who prefer “networks in person” argue: Networks in person are based on a personal relationship, the relationship is real, not artificial, eye contact is important, high confidentiality, people contact, private contact, personal contact, I am close to the person, to the other people, there are confidentiality issues with digital networks, trustworthiness of the information, lower risk of distribution of negative rumours, security, trust, better communication, better understanding, better interaction, it is our habit, my expectations are met, confidential information is kept among few insiders, to talk is always better to avoid misunderstanding, face-to-face is better, because you can see the behaviour of the person, The body language is important. There is no body language in digital networks, Greater honesty and more substantial conversation than in digital networks, I can see the emotions of my contact. You cannot see emotions in digital networks, besides emoticons 😊 😋, exchange of emotions, of trust, spending time together, team building activities, reliability of the source of information. Here what some respondents say:

“The private, personal contact with people facilitates the building and the maintenance of
“Networks such as Facebook, LinkedIn and Twitter are extremely easy to join and therefore get logged up with people joining in on a whim or “just in case”. Personal networks require more personal investment and therefore are entered into more selectively and with more thought as to their relevance and benefits.”

“Digital networks cannot replace personal contact.”

Issues with networks in person are: there are obligations with networks, there are expectations in networks, and networks are time consuming.

Reasons why respondents would prefer “digital networks” are: Easy accessibility of information, low cost, diversity of information, speed of access and publication, flexibility, efficiency, and digital networks are an easy way to have access to private lives.

One respondent says:

“I do not network a lot but, I prefer digital networks if I need to find a piece of information since it provides the access. It is low cost, fast, and diverse and in most circumstances it does not hold any obligations.”

Issues with digital networks are: Confidentiality issues, misuse of trust, false expectations, digital networks are not my world, I am not member of Facebook, Twitter, etc., digital networks are lacking personal contact and therefore are less efficient, superficiality, there are pictures put on Facebook without the permission of the person in the picture, while digital networks are growing, personal contact is lost among people, digital networks are too time consuming, the quality of the information is not always given. Respondents say:

“Networking is convenient but sometimes causes troubles, especially when we connect with someone who we don’t know well.”

“I want nothing more than to be kept in peace. I keep contact with people with whom I want contact. That’s all.”

“Do you really know who you are networking with?”

“I am old! So, I am not used to digital networks, which also seem less rich in context.”
Is the preference for networks in person or digital networks a question of age? Will the younger generation be more reliant on digital networks? Or will the current trend of digitalisation be reversed due to abuse, espionage, and cyber-criminality? Will the future show us where the world will go? More and more digital contacts, faster, free of charge, always available, and everywhere accessible, is this the future? Or will we prefer deep private contacts without superficiality, but with trust, with honesty, with real friendships – far away from +500 Facebook friends – real experiences, events, parties, and relationships? Is the choice to be made between real life and digital life? Is it a matter of age or culture, or gender or education or job category, or nationality and languages spoken? Further research will be necessary to find an answer to these questions, as well as to the following questions: Have we reached the limitations of the digital world? Are we approaching the limits of the e-era, of e-recruiting, e-HRM, e-banking, and e-relationships?

CONCLUSION AND DISCUSSION

The findings of this research are: networks, a shared language and storytelling help the organisational advantage in microfoundations in international environments. Networks are strong among HR managers, with a preference to networks in person compared to digital networks. Networks are a big help to the organisational advantage in microfoundations because, first, they provide access to information, second they provide this information easily, in a flexible manner, and efficiently, and third, they are fast. The cost for this information is low, because of the network. Advantages of networks in person are trustworthiness, confidentiality, reliability, security, good communication, personal contact, body language, eye contact, exchange of emotions, spending time together, building teams, and honesty. Issues with networks in person are that there are obligations, expectations, and it is time consuming.

Advantages of digital networks are the ease of access to information, low cost, speed of access, flexibility, efficiency, and diversity of information.

Issues with digital networks are confidentiality, trust, the lack of personal contact and the perceived lack of information quality, and increased time devoted to using them.

Globalisation, the internet, knowledge management help the organisational advantage in microfoundations in international environments.

A shared language is important in social relations. It enables people to discuss and exchange information, to ask questions and to conduct businesses. Language is used as an identifier. It also creates group-specific communication codes and influences our perception, enables us to combine information, to develop new concepts and create new knowledge. If you do not speak the language,
you are not the “in-group”, but the “out-group”, you are kept apart and have restricted access to information. This is how a shared language helps organisational advantage in microfoundations.

**Storytelling** is a powerful means of SHRM. Storytelling enables the distribution and transmission of values, norms and culture. It is used to share knowledge and understanding and is useful in education and training. Storytelling allows people to communicate, inspires innovation, helps to solve problems and conflicts, to focus and plan the future, to focus on a vision and to take decisions.

It is proposed that networking, in person and in digital form, a shared language as identifier and storytelling are capabilities for shaping the future and success of microfoundations in international environments.

**LIMITATIONS**

The comparatively small sample size is a factor that threatens the generalisation of the findings, as well as the weak theoretical connection between SHRM, the use of networks, a shared language, and storytelling.

**FURTHER RESEARCH**

The main objective of this research was to investigate why networks, language and storytelling help organisational advantage in microfoundations. Survey questionnaires were used to determine the extent to which networks, language, and storytelling influence the success of microfoundations. Further research could focus on qualitative research methods, using more interviews, as well as the influence of new media and age. Interviewing could be of advantage to this research. Indeed, one interview was conducted for the purpose of this research, which validated the findings from the questionnaires. But, it was not included into this paper.

Further research could be made in the domain of new media, comparing digital networks to networks in person, raising the question of the influence of the age of the person on this preference. Furthermore, the limitations of e-HRM, of e-recruiting, e-learning could be the centre of interest in future research.

Another path of further research could be the possible negative outcomes of storytelling.

THE ROLE OF NETWORKS IN INTERNATIONALIZATION OF BORN GLOBAL INFORMATION TECHNOLOGY FIRMS: THE CASE OF SMES IN LITHUANIA

Sekliuckiene, Jurgita

Department of Strategic Management, School of Economics and Business, Kaunas University of Technology, Kaunas, Lithuania

ABSTRACT

This study explores the phenomenon of the born global firms and network as a core activity in internationalization process, especially for entrepreneurial SMEs from small countries. Study aims at filling the gap by providing a comprehensive empirical analysis on this issue in small Central and Eastern European country Lithuania. Despite limited resources that usually characterize new entrepreneurial developments, born global companies achieve substantial international sales in early stage and rapid internationalization, they are niche oriented and usually create innovations. Understanding the internal and external reasons which stimulate born global companies to be involved in international market and network role in the internationalization process were main research questions. Lithuanian SMEs information technology companies were investigated. In the article the internationalization motives are provided which influence the growth of Lithuanian born global information technology firms in terms of network and entrepreneurial quality. Finally, the research contributes to the phenomenon of born global firms and may be useful to SMEs reaching for a more successful penetration to foreign markets.

Keywords: born global, networks, international entrepreneurship, information technology industry, Lithuania.

INTRODUCTION

Because of the growth of international business integration and globalization, internationalization of services companies became as a necessity trying to remain and develop their business despite the size of firm, managed resources, and type of the activity. Also, internationalization process is becoming an important strategic element in reaching for sustainable growth of the firm. Relevancy of theory and practice are grounded on the possibility to explore preconditions of internationalization that enables susceptible to knowledge information technology firms. Those born global firms usually distinguish for entrepreneurial performance, ability to act internationally, and the influence of networks to them. In
addition, born global firms achieve good results by acting in networks. The research problem was analyzed by such scholars as Onkelinx and Sleuwaegen (2010), Johanson and Vahlne (2003) and others, who were exploring internationalization of MNEs. Internationalization stages were investigated by such scholars as Vasilchenko and Morrish (2011), Gonzalez and Sieglinde (2012). Sheppard and McNaughton (2011) as well as Kontinen and Ojala (2012) are the researchers who were exploring factors that determine a rapid internationalization process of born global firms, models, and barriers. The biggest number of researches was done in the concept formation of born global firms; however, the information of the activity of this phenomenon, particularly the network among born global firms is missing. Over the last few years an increase of researchers and practicians’ interest in network influence to the internationalization of born global companies is noticed. The researches were done by Andersson and Victor (2003), Autio et al. (2000), and Zhou et al. (2007). The researches are focused on entrepreneurial characteristics of born global firms from Scandinavian countries, Ireland, Israel, and USA. The research based on entrepreneurship on network processes was analyzed by Slotte-Kock and Coviello (2010). However the internationalization of born global Lithuanian firms and the role of network is quite a new subject requiring deeper analyses.

The research problem is supposed by fast changes, which determine that internationalization strategies of born global firms from emerging markets, as Lithuania is one of the emerging countries in Central and Eastern Europe. Therefore, network among born global firms, motives and barriers that condition decision making, and a search for new successful internationalization path are one of the most relevant scientific fields.

The research problem may be revealed by following questions: what are internal and external factors that stimulate the penetration of Lithuanian information technology firms to international markets? what are the external linkages of born global companies acting in networks? Aim of the article - to explore involvement of Lithuanian born global information technology firm in networks and what the role of networks is.

Due to the limited research in Lithuania on the topic, the systematic and comparative literature analysis and empirical approach to tackling this issue by applying a qualitative research of information technology companies were employed.

LITERATURE REVIEW

Although internationalization is an essential factor for the growth potential of born global companies, it is quite difficult process and requires a lot of companies’ resources. Limitation of resources and experience as well as the possible risk to organization are the key factors disturbing the internationalization of SMEs. Inspite of this, the number of born global within SMEs is constantly
increasing, these firms are successful in penetration to international markets, and their main characteristic is a rapid internationalization to foreign markets. Scientific literature provides a variety of firms which started their activities in international markets from the very beginning after the establishment, and these were called High Technology Start-Ups, International New Ventures, International Entrepreneurs. However, it is noticed that most of the scholars analyzing the performance of these companies describes them as Born Global firms (Knight and Cavusgil, 2004; Rialp et al., 2005; Gabrielsson et. al., 2008; and others). According to Hagen et al. (2012), the increasing number of dynamic firms is noticed, which penetrate to international markets after a short period of their establishment, entering many foreign countries and lay under obligation to those countries. Such firms export their production up to 25% to the foreign markets (Andersson ir Wictor, 2004). As Luostarinen and Gabrielsson (2006) state, at the beginning of their activities, born global firms sell up to 50% of their production outside their countries. In comparison with traditional firms, born global companies are more specialised and niche oriented with unique, innovative products that are either more custom made or more standardised (Dib et al., 2010; Freeman et. al., 2012). They target a narrow customer segment, which might be geographically distributed (Aspelund and Moen, 2010). Born global firms see themselves as owning or possessing a source of competitive advantage in foreign markets by way of their expertise, unique product features, better technical service, knowledge competences or a combination thereof (Evangelista, 2005; Kudima et al. 2008). Born global companies usually work very entrepreneurial. International entrepreneurship of these companies associated with international oriented and experience, proactive, risk–taking behavior that crosses national border, level of technical and know-how knowledge (Dib et. al., 2010; Hartsfield et. al., 2008). The firm’s entrepreneurial orientation contributes to its ability to create processes, practices, and decision making activities that are linked with successful entrance to foreign markets (Knight and Cavusgil, 2004; Roudini and Osman, 2012). The managers of firms that follow an international entrepreneurial orientation stress the importance of having a proactive and innovative approach to operating in international markets. This orientation in foreign environments supports a firm’s awareness of key strategic initiatives that enable international success (Knight and Cavusgil, 2004).

According to Knight, Cavusgil (2009), and Halldin (2012), the origination of born global enterprises was stimulated by following aspects: 1) Advancement of technologies in production and transportation systems. 2) The enforcement to specialise in order to sustain competitiveness of the firm; it determined the emergence of many niche oriented markets. In order to function in niche oriented markets, firms had to increase the number of their customers by moving to global markets. 3) Advancement of information technology. 4) The advantages of small firms: better reaction, flexibility, adaptability. 5) Globalization based on knowledge, which eliminated many international trade barriers. 6) Trends in
the world networks, which formed because of advancement of information technology. In addition, for the use of social networks, born global firms are able to master global market information and effectively apply it to the business expansion. (Oviatt ir McDougall, 1995; Freeman ir Cavusgil, 2007; Hartfiel et al., 2008; Schulz et al., 2009).

In the perspective of network theories, internationalization is associated with a creation of new networks and grounded on theories of dependancy of social exchanges and resources based view (Johanson and Vahlne, 2003). Relationships among participants in network appear because of the aim to exchange valuable resources, and this interface continues until it is beneficial for both of the parties. When the network is already established, enterprises share among them all the works what means a dependancy on each other (Sasi and Arenius, 2008). Gilchrist (2009) states that network is a movement and share of ideas, information, knowledge, practise and experience, and exchanges among members aiming at common interest of creating added value in a particular field. According to a provided definition, three key network elements may be exhibited: a common aim of the participants, collective relations, and operations in the network. The network of born global companies comprises of collective relations among firms and external members (clients, suppliers, business agents, competitors, universities, and other players), who could have an ability to propose something in exchange of something to other members of the network (Hite and Hesterly, 2001; Zhou et al., 2007). Born global company may mobilize resources through external relationships to pursue its goals (Johansson, 2005).

Entrepreneurial enterprises situated in a network of existing and to be formed relations with important upstream (e.g. suppliers, parent company), downstream (e.g. distributors, customers) and horizontal actors (e.g. competitors, alliances, universities). These relations derive characteristics from the resource requirements of the company and as such also influence the growth of the firm in two important respects. Firstly by way of influencing the identification of opportunities, and secondly by influencing how the opportunities are acted upon and realized (Johansson, 2005).

Network theory stresses that networks help the firm overcome any resource constraints that they encounter; also provides better access to resources and international opportunities, and international network relationships reduce risk while entering foreign markets. Network is essential for a born global firm in overcoming any resource constraints that it encounters (Kocak and Abimbola, 2009). In the initial stages, born global firms leverage their networks to generate organizational skills and competencies, including technological capabilities (Cavusgil and Knight, 2009). Network relationships also generate the social capital that provides a better access to resources and international opportunities and the means by which to overcome the liabilities of newness and foreignness (Kocak and Abimbola, 2009). Therefore, after internationalization is well underway, managerial focus shifts to developing human resources to support further growth. Subsequently, the firm turns its emphasis to building its
client and distribution base. For born global firms networks are critical for generating social capital and provide for the acquisition, mobilization, and development of the needed resources (Cavusgil and Knight, 2009).

BRIEF OVERVIEW OF LITHUANIAN INFORMATION TECHNOLOGY INDUSTRY
Lithuanian IT services firms distinguish for their orientation to export markets. Several years ago Lithuanian firms were competing in foreign markets mainly for low labor costs. In the last years Lithuanian IT companies have been participating in the international exhibitions, have been creating clusters and high added valued products that are successful over the world. The results were increase of export volumes, emergence of new clients and increase of foreign investments to Lithuanian IT sector (Ivanovas, 2013). In 2012 the main export markets of Lithuanian companies provided IT services were Denmark (23,7 % of the total sector export; the value was 15 million Litas, 1 EUR=3.456 Litas), Singapore (respectively 16,6 % and 10 million Litas), USA (respectively 11,8 % and 7 million Litas), Finland (respectively 8,3% and 5 million Litas), and Germany (respectively 8,1 % and 5 million Litas) (Dovydėnas et al., 2012). Moreover, exports of computer and information services continued their steady growth in Lithuania. The export of IT services reached 114,2 percent in the period of 2010-2012, and exports took about 2.5% of overall country’s exports in 2011 (Enterprise Lithuania, 2011). In addition, there is forecasted a fast export growth of IT services. Such a rapid growth of IT services export was mostly influenced by direct foreign investments to IT services sector. Finally, qualification of Lithuanian IT firms meets all the set requirements. That is shown by such companies as DeutchBank, which was provided of software by Alna Software, Nokia, which became a partner with a creator and producer of telecommunication products Teltonika, and Bentley Sytems, which works with Lithuanian programmers for twelve years (Penkios svarbiausios Lietuvos IT sektoriaus raidos tendencijos, 2013).

METHODOLOGY
The empirical research aim was to explore factors affecting companies’ internationalization and companies international entrepreneurship; the importance of partnership and network in born global companies activities. Based on relevant management literature described earlier, the investigation dimensions were identified: stimulation of the origination of born global enterprises and internationalization motives and assesment of the the role of network as the core activity in value creation. The following specific objectives (SO) have been formed:
SO1: to identify the motives that have impact on involvement of the born global firms in international activities and international entrepreneurship. Such exploratory variables were explored: external and internal factors, affecting the beginning of international activities.

SO2: to assess the external relations and the role of network in born global companies activities. The research criteria were investigated: profile of main partners and the external linkages between horizontal, upstream and downstream actors, sustainability of collaborations, partner finding methods, scale and scope of the networks, benefits of being involved in networks and barriers to networking.

On the ground of Lithuanian Statistics Department (2013) 2185 firms belonged to Lithuanian IT sector in 2012. Small and medium sized enterprises were the predominant ones in IT sector and comprise around 84% of all IT firms. IT enterprises are united by Infobalt Lithuania association, which is a locally and internationally recognized representative of Lithuanian ICT industry. Infobalt Lithuania cooperates with the state institutions of Lithuania and other partners. Association is a member of Digital Europe and World Information Technology and Services Alliance (WITSA), international ICT industry organizations. Based on the data of the association, around 150 Lithuanian IT enterprises are exporting on a regular basis. Other firms are limited to the local market or export their production to foreign markets occasionally.

The research sample was 28 companies (E1, E2, E3, ..., E28) that were selected from Infobalt Lithuania database, accepted to be surveyed by using an interview. Such criteria for choosing the respondents for qualitative research have been selected: 1) the company should be involved in international activities; 2) income derived from foreign markets includes more than 25%. The semi-structured questionnaire has been developed and content analysis has been made. Selected companies agreed to participate in an hour-long semi-structured interview. The approach allowed the researcher to ask supplementary questions. The organisations chosen for the collection of qualitative information through semi-structured interviews are listed in Table 1.

The sample is not representative for the population, but it is significant if compared to IT companies that started their international activities in the first three years from their establishment. Some of interviewed companies were not actively involved in other international networks and it is another limitation to research.
Characteristic data of the surveyed companies revealed that the majority of the companies are micro sized: 11 companies involved in the research have up to 10 employees, 8 companies small sized, and have from 14 to 50 employees, other surveyed medium sized companies have up to 80 employees, and only one company has 210 workers. The survey was carried out in April – May 2013.

RESULTS

SO1: to identify the motives and factors, that have impact on involvement of the born global firms in international activities. Managers of the SMEs companies that took part in the research have pointed

*Size of the company estimated by number of employees, when micro sized enterprise has 1–9 employees, small sized has 10–49 employees, medium sized has 50–249 employees, large sized more than 250 employees (Law on Small and Medium Business Development, 2010).
out that they work in the markets of European countries, USA, Asia, and Africa. Information technology services are mainly exported to USA, Latvian, and German markets. These markets are attractive for Lithuanian IT companies due to diversification of the business risk, protection from national currency depreciation, opportunities of involvement in international networks by offering an innovative product which is being created by the cluster of Lithuanian IT firms.

Main motives which push born global companies to act quickly in international markets are risk distribution and small Lithuanian market, in which companies do not have a possibility to expand their business and to find a segment of the market for provided services: “In Lithuania there was no market which can be oriented for service”, “… the Lithuanian market is too small for us”, “… in Lithuania we did not find our market segment”. The aim to foothold in foreign markets for Lithuanian IT sector companies is not so important, and the least important thing – competitors operating in the local market.

The external factors compared with internal ones do not have a significant impact on the international start-up activity and entrepreneurship of Lithuanian born global IT companies. The worst impact on firms has information technology spread, which may be considered to contribute to accelerating firm’s presence in the foreign markets, their ability to compete with much larger companies. Partnership also affects company’s internationalization. It can be seen that networking and cooperation with partners for Lithuanian born global IT sector companies provides valuable knowledge and makes it easy to start-up internationally, predisposes joint-ventures start-up. Partially, the beginning of the international activities of the enterprise is driven by increasing competition in the international market. The managers of companies mentioned that accelerating development of information technologies leads to greater support of non-financial public institutions, and as a result companies are learning on their own more often. An accelerating pace of information technologies predisposes born global IT sector companies to connect to networks.

Lithuanian IT sector companies collect information about the customers, competitors and service sales systematically. Only few companies in foreign markets perform market research in foreign countries due to the high costs. Company’s decision making are mostly influenced by the international environment. Cooperation with partners and network as well as local market influence strategic decisions only partially. The biggest part of Lithuanian IT sector companies entered international market rapidly and immediately. These companies have entrepreneurial characteristics: the ability to respond rapidly to changing customer needs and environmental factors, ability to take risky decisions, interest in future forecasts. Results of the study shows that in several companies the income from international markets is almost 100%, and these companies are solely oriented to foreign markets.

SO2: to assess the external relations and the role of network in born global companies activities. Research results revealed that born global IT companies collaborate with various national and
international organizations. Most of the companies (25 out of 28) stated that they collaborate with foreign market (where their firms operate) companies: “Our main partners are foreign companies. And we have lots of benefits from the cooperation with them”. However, many Lithuanian born global companies cooperate with Lithuanian firms (17 out of 28) operating in Lithuania. Managers of surveyed company noted that “cooperation with Lithuanian organizations helps to compete abroad and we are cooperating with Lithuanian Business Support Agency, Enterprise Lithuania”, “<…>when a task-specific knowledge is needed, then we appeal to Lithuanian companies with necessary expertise for that”.

Representatives of IT companies have stated that companies are cooperating with customers (13 out of 28) when providing service (“Our customers are our partners, since cooperation with them improves our quality of services provided”, “<…> clients help us to figure out pros and cons of the services provided in the most efficient way”, “<…> in collaboration with clients we create new products”). Horizontal cooperation with educational institutions and universities (12 out of 28) is useful, because “collaboration with universities brings us considerable benefit. Cooperating with educational institutions we organize surveys, idea development workshops”, “<…> we are taking various projects in collaboration with universities, and it brings benefits to both the company, students and university. One of our main partners is Kaunas University of Technology with an innovative platform, start-up space and variety of technological solutions and services”.

The most popular partner finding method of SMEs companies is Internet (16 out of 28) and the recommendations of friends and acquaintances (16 out of 28). The surveyed managers of IT companies noted, that “first of all, we are looking for partners we could collaborate with; then, we are searching for contacts of those firms on Internet, and finally, we are trying to make acquaintance of them”, “<…> when I want to collaborate with someone, I ask my colleagues and friends for recommendations or necessary contacts, and only then I begin to search for it through other channels”.

The active search is performed in Lithuanian institutions, which provide business support and affiliate search engines. Enterprise Lithuania is one of the main founding partners of Startup Lithuania movement which promotes the development of new entrepreneurial companies and their business acceleration (www.startuplithuania.lt/) by involving them in specialized events, supporting in finding investors, providing trainings and consultations. For the SMEs companies investment may be the gate opener to the international markets because trade channels can be formed through the new partner network and using their experience, specific knowledge of the market. The managers mentioned that “in the partner search database the provided information allows to select the firms easier and faster to whom might be able to cooperate”, “<…>the best way for us to find foreign partners we might collaborate with is through the partner search database provided by Association of Lithuanian Chambers of Commerce, Enterprise Lithuania, Startup Lithuania”.

The Future of Entrepreneurship

A part of Lithuanian born global IT sector companies is looking for partners in international exhibitions, fairs and conferences. The analysis of the study showed that majority of the surveyed companies participate in the association Infobalt Lithuania activities, however in other international networks participate only 15 out of 28 surveyed subjects. 3-7 companies are usually running in the network. The few companies are involved in network with 14-15 firms: upstream actors (suppliers), downstream actors (distributors, customers) and horizontal actors (competitors). Companies adapt and align their networks to gain the resources they need to ensure successful emergence and growth. Partnership with strong foreign companies is substantial. Strong partner which actively participate in an international network provides the access to necessary resources, skills and competencies. Such activities which are being developed between network partners were identified: knowledge sharing (26 out of 28), experience (21 out of 28), creation and production of innovative products (14 out of 28), consolidation in the foreign markets (13 out of 28), research and development activities (7 out of 28), costs sharing (2 out of 28). The managers mentioned: „While collaborating, not only we transfer our knowledge to partners, but also we get a lot of information from them which is useful for our activity”, „We often arrange meetings where we are able to share our knowledge with partners because that is a way to improve firm performance”, „In order to avoid mistakes that were done by us or by our partners, it is important to share the experience“.

Acting in the network with other companies, Lithuanian IT sector companies gain a competitive advantage on the local and foreign markets. The effect of network promotes and stimulates innovation, which is very important in order to maintain a competitive advantage in the local and foreign markets: “In cooperation with business firms we gain experience which is applied in reality. Our position in the foreign markets is consolidated by the network”, „<…> acting in networks let us to get useful information from professionals of different fields as well as to share our ideas with them”. The interviewed managers have agreed that cultural attitudes are main barriers that influence the development of international networks and social capital. Communication disturbance because of unclear information or information abundance have been named as main barriers by most respondents („<…> information abundance may result in reduction of relationships with partners; although the information may be of a high importance, because of the large amount of information it is not always read on time“, „<…> at the early stage of cooperation it is usually difficult to understand partners as the manner of communication is different as well as the ways of exchanging information“). At the beginning of international business activities many firms confront with language barrier described as follows: „As soon as we began to collaborate with foreign partners, we faced a language barrier as it was quite difficult to understand the accent of employees”, „<…> at the early beginning, employees were not good at spoken English and it was not
so easy to communicate with partners face to face”. Finally, the collaboration is not enhanced because of unobtainable tasks and results that are planned with partners, and steady adjustments to the partners.

CONCLUSION

The data of the empirical research revealed, that internationalization of Lithuanian born global information technology firms is determined by external (IT development, partnership, and network) and internal factors (manager’s knowledge and skills, firm’s innovation, unique services) which become catalyst for motives to emerge. The accelerator of internationalization becomes the effect of network and partnership support between born global companies and their partners. In some cases the partner is university. University’s innovation centres or start – up spaces works like platforms for new entrepreneurial firms, providing them with support, knowledge and infrastructure. The part of the surveyed companies usually has the network of 14-15 national and international business firms, upstream, downstream and horizontal actors. It is important to have a strong partner which could access to new partners in networks and provided necessary resources for the development of new products seeking the growth and the development of Lithuanian born global company. The company’s position in international markets is strengthened by network with different institutions, international associations. It also enhances cooperation between enterprises, development and implementation of new projects, customer search; provides an opportunity to share knowledge and experiences, and to learn from the partners. However, the part of the surveyed Lithuanian information technology firms is not involved in the international networks. There are several possible explanations for that. Firstly, Lithuanian government and universities started to actively promote entrepreneurial star-up activities only few years ago. During the last two years there were lots of start-up events, conferences, workshops, IT business missions which were very successful. These events encourage young entrepreneurs quickly start international activities. The multinational players entering the market like Barclys, Western Union, and IBM impacted on the costs of human resources, and competitiveness of Lithuanian SMEs. Nevertheless, this reason might be as an accelerator in the nearest future. Highly qualified employees with work and network experience in multinationals might start to run their own SMEs business. This finding suggests a necessity of further research on international entrepreneurial orientation in information technology industry and network development of Lithuanian born global issues. The further research could be enriched with comparison between different types of businesses: micro, small and medium sized enterprises.

ECONOMIC EVALUATION OF SHORT-TERM DECISIONS IN WINEGROWING FARMS

Sgroi, Filippo; Di Trapani, Anna Maria; Squatrito, Riccardo; Testa, Riccardo; Tudisca, Salvatore

Department of Agricultural and Forestry Sciences, University of Palermo, Italy

ABSTRACT

The majority of small sized Sicilian winegrowing farms are placed in the first part of the supply chain. In this way they are subjected to the grapes prices fixed by the wineries, becoming price takers. This situation determines marginal revenues lower than average costs and in short-term a reduction of farmer income that it can allow to farm bankruptcy. In this context farmer should adopt economic strategies in order to obtain higher profit in a more and more competitive market. The aim of this paper is to understand whether, decreasing labor cost in short-term by means of process innovation, average costs of small sized Sicilian winegrowing farm do not exceed marginal revenues.

Keywords: Average cost, competitive advantage, marginal revenue, profit.

INTRODUCTION

The choices that an entrepreneur can make to achieve a competitive advantage may be short and long-term. This distinction is crucial as in the short term the entrepreneur can act only on variable production factors (Begg et al., 2011). In the short term, it is difficult to radically change the production process or the production orientation of an enterprise. These choices are indeed strategies better implemented over the long term. Therefore, given a combination of production factors, the entrepreneur can only modify the input affecting business productivity (e.g. by increasing the amount of fertilizer), or decide to act on any input allowing to lower production costs such as those relative to labor (by mechanizing a given agricultural operation thereby increasing the productivity of the labor factor). These choices become fundamental for an entrepreneur who operates in a market where average cost is higher than marginal revenue (Messori and Ferretti, 2010; Schotter, 1995). In fact, in this situation the enterprise produces a loss for each unit of product. To offset this situation, without altering the whole productive structure of the company, the entrepreneur may introduce process innovations that enable him/her to drive down the average cost below the marginal revenue, thus producing a profit (Tudisca et al., 2013a). This situation can be maintained as long as competitors do not imitate this strategy (Tudisca et al., 2013b). The imitation of the strategy on the part of competitors
will lead to a decreasing marginal revenue until it equals the average cost of production or even drops lower than it, thus restoring the previous situation. The successful business formula, for an entrepreneur operating in highly competitive environments, consists in emerging strategies that enable the company to create and maintain its competitive edge (Tudisca et al., 2014a; Crescitamanno et al., 2013; Szabó and Popovics, 2009; Invernizzi, 2004; Coda, 1988). In this work, we have analyzed how a wine-growing farm which operates in conditions of average costs greater than marginal revenues can gain a competitive advantage in the short term.

**COMPETITIVE ADVANTAGE**

A competitive advantage is the result of a strategy that leads the enterprise to occupy and maintain a favourable position in the market in which it operates, with the effect of keeping its profitability higher than its competitors. It manifests itself in the ability of the enterprise to create value for the market that is greater than the one developed by the competition and that is also lower than the costs incurred to create it. A competitive advantage is therefore the expression of a position that is superior to that of competitors in the same strategic grouping (Fontana and Caroli, 2006; Parnell, 2002).

Such a situation proves highly convenient in the marketplace of undifferentiated goods and services, as exemplified by the case of commodities, where the entrepreneur often works in conditions of average cost (AC) higher than marginal revenue (MR) (Figure 1).

![Figure 1 – Enterprise operating with average costs higher than marginal revenues](image)

In B point, where marginal cost (MC) is equal to price (p) and to MR, enterprise has a loss for each unit of output produced.
In this situation, achieving a level of total unit costs lower than that of competitors, is the only way to achieve a position of competitive advantage (Favotto, 2007). In this case, the enterprise can operate with a level of average costs lower than the marginal revenue and thus determine a profit for the business (Figure 2).

![Diagram](image)

**Figure 2 – Enterprise operating with average costs lower than marginal revenues**

So, in point A the AC is lower than price and thus enterprise realizes a profit.

At the present time, the ability to contain costs to the greatest possible extent represents an indispensable competitive condition for many agricultural businesses that go no further than the first stage of the production chain.

The ability of a farm to operate at a level of unit costs lower than competitors allows it to control the competitive lever of prices. The company can lower the sales price of its offer to a level which, whilst remaining above its own average cost, is lower than that of its competitors (Pellicelli, 2005; Peteraf, 1993). The latter are bound to lose market shares in favour of the cost-leading company, unless competitors quickly lower their average costs and follow the lowering of prices, or increase the value of their supply (Besanko et al., 2001).

This situation determines an increase in demand, which elicits an increase in production of the enterprise; this growth increases the exploitation of economies of scale and the accumulation of experience. Furthermore, it can also favour a greater control of the supply chain. The increase in demand allows the enterprise to strengthen its cost advantage, putting it into a position to reduce the sales price again and foster more demand. However, even if this situation is applicable to the industrial sector, it is not particularly suitable for the agricultural sector where supply is rigid in the short term, depending on the characteristics of the activity carried out (Guerrieri et al., 1995; The Future of Entrepreneurship ISBN: 978-9963-711-27-7
Prestamburgo and Saccomandi, 1995). However, the entrepreneur may still reach the market with a lower average cost for the produced units that depend on the production structure assumed as a long-term choice (Rispoli, 2002; Volpato, 2000).

It is necessary to highlight that the advantage resulting from cost leadership does not necessarily translate into a decrease in price. It is in fact clear that if the cost-leading enterprise keeps the price of its supply at the levels of the average costs of the competitors, this has an important effect on the financial structure of the company and on its investment capacity. All other conditions remaining equal, the greater margin allows, on the one hand, a higher level of self-financing and, on the other hand, higher returns on risk capital (Santeramo et al., 2012; Coeurderoy and Durand, 2004). In the first case, the enterprise increases its net assets, and hence at the same financial leverage, the stock of debt that it is able to run up. In the second case, it creates more favourable conditions for the possible acquisition of new risk capital. In both situations, the greater margins of income generated by cost leadership are reflected in the increase of available financial sources. The increased sources of funding, in fact, foster investments (in fixed and working capital) and the expansion of the enterprise's turnover. In a situation of market stability, the higher levels of available sources allow the company to make investments that improve efficiency or that allow it to develop differentiating features in its offer, compared to its competitors. Cost leadership leads to a greater capacity for company growth and/or it strengthens its competitive position in terms of increasing cost advantage or even differentiation (Kaniovski, 2005; Ferrucci, 2000).

Cost advantage is primarily pursued through actions aimed at the most important cost determinants in the activities of the value chain where most of the costs lie. This position is obtained from the exploitation of production economies (scale and experience), which is a typical strategy of enterprises that aim at cost-based leadership. In relatively stable markets with a ratio between optimal minimum dimension and total demand that is not exceedingly low, the capacity of the company to take on a dimension with a more efficient production level (being able to defend its corresponding market share) represents a strategy that competitors find difficult to imitate and which thus leads to a sustainable competitive advantage.

The innovation of process or of product is a second path to reach a sustainable cost advantage, at least in the medium term. Thanks to innovation, the company can rely on better technologies than its rivals, allowing it to produce under conditions of greater efficiency or to create a product that, at the same value to the client, has lower production costs (Desai et al., 2001).
MATERIALS AND METHODS

In this study, an analysis aimed at determining cost leadership of a small sized enterprise was conducted within a winegrowing farm producing grapes of Merlot cultivars in Sicily, the largest island in the Mediterranean sea with a typical climate with hot and dry summers and mild winters (Grillone et al., 2014; 2012; D’Asaro et al., 2012). The grapes produced are not transformed into wine inside of the farm but are sold to processing firms. These types of firm are widespread in Sicily (Tudisca et al., 2014b). The research was geared to answer one question: starting from a situation where average cost is greater than marginal revenue how can the farm gain a competitive advantage.

The data were collected through a direct interview (Tudisca et al., 2014c).

The strategy aimed at acquiring a condition of cost advantage results from a process that can be described according to a rational procedure using the value chain (Porter, 1980).

The analysis should start by analyzing the various steps that lead to obtaining the output. In this phase, we analyzed operating costs incurred by the farm in relation to the single activities of the value chain (Collins and Montgomery, 1997; Airoldi, 1980). For each activity, the proportion of operating costs that it entails is estimated. This phase leads to highlighting the activities which are crucial, from a costs point of view, and that consequently have more weight in the strategy here examined. Cost advantage is a condition that must be assessed in relative terms: that is, it depends on the level of the farm’s costs compared to its competitors, rather to the average cost of the strategic rival grouping.

The second phase consists in comparing the costs incurred by the farm for the implementation of the various activities to those that competitors face in the corresponding activities of the value chain (Pontiggia, 2001; Perrone, 1990). This phase depends on the actual availability of data that the entrepreneur has regarding the cost structure of the firm being compared. In most cases, considering the level of technology, this information is easily obtainable also thanks to the experience that the entrepreneur has of the sector; where experience is lacking, average data of the sector could be used for reference. The comparison with competitors is an essential stage of the procedure, as it highlights two basic conditions for the subsequent devising of the strategy for cost leadership. First of all, sustainability; it is clear that the company may seek to implement this strategy only if it has a cost structure at least potentially better than that of competitors. Second of all, it focuses on the activities that are critical for the determination of cost advantage, highlighting those where there are major differences with respect to competitors.

The third phase can be defined as “operational”. In this phase, we have the logical passage between the process phase that outlines the general situation that is “critical” in terms of cost, and the phase relevant to the devising of the strategy. In this third phase, the determinants of level of costs are studied. These determinants are evaluated with reference once again to the individual activities of the
value chain, with attention mainly to those activities that the previous two stages have identified to be the most critical from the point of view of the overall cost trend.

The determinants of the level of costs also concern the interdependencies between the activities of the same value chain and those between the activities of different value chains. Even the study of factors from which the cost trend depend must be carried out within the limits of available information, in a comparative way with respect to competitors.

On the basis of observations of the various determinants of costs, we proceed to define the strategy to achieve the position of advantage over competitors. This strategy can go in two different directions: on the one hand, it can be oriented to detect interventions on cost determinants aimed at achieving the best result in the various activities of the value. Alternatively, it can innovate the organization of these activities in relation to the constraints and opportunities inherent in the features of the various cost determinants (Roy and Vézina, 2001; Sharp and Dawes, 2001).

The last phase identifies the actions to be taken in order to implement the strategy defined in the previous phase and the new procedures that can be used for that purpose.

RESULTS AND DISCUSSION

The results obtained show that the total cost of production amounted to 40.37 Euro/q, of which 27.43 Euro/q are represented by costs for cultivation operations whereas 12.95 Euro are the calculated costs (Table 1).

Table 1 - Economic results
Source: our processing of directly collected data
In the first group, as well as in other studies (Tudisca et al., 2011), the greatest value is represented by costs associated with winter pruning and tying (5.31 Euro/q) and those relative to harvesting (7.23 Euro/q). These costs together account for 31.3% of the total cost of production. Within the same field of costs of cultivation operations, green pruning entails 10.5% of the total cost of production followed by treatments (7.4%), fertilization (6.5%), the tilling of soil and irrigation, that represent 3.7% each. Within the frame of calculated costs, significant importance is represented by the cost of reinstatement of the plantation (15.7% of the total), followed by the interest on the land capital (7.8%), taxes (3.9%), general expenses (3.5%) and interest (1.2%). Even the competitors have a cost structure very similar to that of the enterprise examined. The minor differences that exist are due to the construction of the average data which reflects the various business situations of the area under investigation.

At this point, as mentioned in the methodology, within the scope of the production process, the entrepreneur can act on some costs that determine the lowering of the total cost of production. Compared to the situation of the competitors, our entrepreneur may act on the costs of winter pruning and harvesting (Kunihiro, 2013; Sarig, 2012). In particular, other studies carried out (Tudisca et al., 2013c) show that process innovations may be introduced in the company regarding pruning even with small surfaces, while for harvesting, as large land surfaces are required, the entrepreneur finds advantageous introducing third party harvesting. In perspective, the total cost of production is lowered from 40.37 Euro/q to 32.85 Euro/q (-18.6%). Even compared to the average situation of the competitors the cost is lowered by 19.6%. The comparison of the new situation (after acting upon process innovation) with that of competitors leads to a clear economic advantage of the company examined compared to competitors.

CONCLUSIONS

The evaluation of entrepreneurial decisions are crucial for creating and maintaining a competitive advantage. In this regard, neoclassical theory teaches us that among the possible options that the entrepreneur considers, he/she chooses those that allow him/her to achieve the maximum profit. In this work, we have analyzed the input an entrepreneur, who produces undifferentiated products, can act upon in order to create a competitive advantage.

The empirical analysis developed on a case study highlights that the innovation process determines a decrease in the average cost of production and which, equally to marginal revenue, lead the company from a loss to a condition of profit. This strategy is also applicable to small and medium-sized enterprises.

Process innovations thus lead the enterprise to achieve a competitive advantage that can be kept as long as competitors do not imitate the same strategy. However, even if the strategy is imitated by
other companies, the entrepreneur will always find it convenient to innovate (as long as the average costs are equal to marginal revenues) because, most likely, the market will lower prices and thus remaining anchored to a technological structure that is not state-of-the-art, would determine heavy losses to business.

AN EXPLORATORY RESEARCH ON FAN’S BRAND COMMITMENT TO BASKETBALL TEAMS

Shuv-Ami, Avichai1; Thrassou, Alkis2; Vrontis, Demetris2

1Marketing & Advertising Department, College of Management, Israel
2School of Business, University of Nicosia, Cyprus

ABSTRACT

The current study is exploratory research that focuses on fan commitment to basketball clubs and supports that this is consequent to a series of attachments that extend further to, and transcend, just loyalty and satisfaction. The research utilizes the 4E’s commitment scale, identifying commitment to have four underlying dimensions: (a) an “evaluation attachment” - the evaluation of brand performance relative to alternatives (b) an “experiential attachment” represents consumer satisfaction with the brand experience (c) an affective component of brand commitment is represented by the “emotional attachment” - the feelings of loyalty toward the brand and (c) an “engagement attachment” that encompass the degree of involvement with the brand. Methodologically, the research is based on two empirical survey studies, with separate and independent identities, with samples of 360 and 272 respondents respectively. Using Exploratory Factor Analysis (EFA) and nomological network analysis the research established the validity and reliability of a new and multi-dimensional scale to measure fans commitment (4E) to their basketball team (club). The value of the research lies primarily in its development of this multi-dimensional scale that provides a better insight to fans behavior than past researches’ uni-dimensional scale. Furthermore, the dimensions of this new scale provide a better understanding of the four important constructs of loyalty, involvement, satisfaction and performance; themselves representing four types of fan attachments to their club.

Keywords: Basketball, Club, Fans, Commitment, Brand, Attachment, Loyalty, Involvement, Satisfaction, Performance

INTRODUCTION

Sport marketing literature has dealt with the concept of fans’ loyalty (Mahony et al., 2000) and fans’ satisfaction (Kennett et al., 2001); however, only few studies (Bee and Havitz, 2010; Mahony et al., 2000) actually examined the concept of fans’ commitment to their team. Even these, only used a direct
and single scale to measure fans’ psychological commitment. Following Keller and Lehmann’s (2006) work, this research study suggests that in sport marketing, commitment to a Basketball club is a series of attachments that extend further to, and transcend just loyalty and satisfaction. Utilising Shuv-Ami’s (2012) 4E’s commitment scale, we suggest that the commitment of fans to their Basketball club has four underlying dimensions: (a) the feeling of loyalty that represents the emotional attachment (b) the degree of involvement with their team, which represents the engagement attachment (c) the calculative component of commitment is based on satisfaction, which reflects the attachment consequent to the shared experiences with the team and (d) the perception of relative brand performance as the functional or evaluative attachment.

BRAND COMMITMENT – THE THEORETICAL FOUNDATION

Most researches in marketing agree that brand commitment represents the relationship between the consumer and the brand. Nonetheless, while one school of thought views this type of relationship as reflecting an exchange-like nature (exchange perspective), the other views it as reflecting an attachment or a bond to the brand (attachment perspective). The exchange perspective views commitment as the desire to continue the durable and valued relationship with the brand in the future (Moorman, Zaltman and Deshpande 1992; Morgan and Hunt, 1994; Dholakia, 1997; Samuelson and Sandivik, 1997; Gurviez and Korchia, 2002; Johnson et al., 2006; Walsh et al. 2010; Belaid and Behi, 2011). The exchange perspective also involves such concepts as: developing stable relationships with partners; accepting short-term sacrifices in order to maintain relationships; and assuring the stability of the relationships (Anderson and Weitz, 1992). This exchange provides customers with the confidence of maintaining the brand’s functional and affective benefits, which are greater than the benefits from ending the relationship (Geyskens et al., 1996).

The attachment perspective of brand commitment is viewed as the psychological and economic attachment that a consumer may have towards a particular brand (Thomson et al., 2005). In recent years, research in marketing using the attachment perspective of brand commitment (Hur et al., 2011; Iglesias, Singh and Casabayó 2011; Royo-Vela and Casamassima, 2011) relied mainly on the affective commitment component of employees to their workplace and were carried out primarily in the context of organizational behavior (Meyer and Allen, 1991). Klein et al. (2009), defined commitment as the degree to which individuals perceive that they are bound to a given target, recognizing that the bond or the attachment may also represent feelings and not just perceptions. The relationship with the brand is based on a "series of attachments” (Keller and Lehmann 2006, p. 745) and on brand equity as the critical driver (Park et al., 2010).
Following the above theoretical framework, this research suggests that brand commitment includes four types of attachments: the functional or "evaluation attachment" - the evaluation of brand performance relative to alternatives, the "experiential attachment" represents consumer satisfaction with the brand experience, the "emotional attachment" - the feelings of loyalty toward the brand and the "engagement attachment" that encompass the degree of involvement with the brand.

**DEVELOPING THE HYPOTHESES**

The 4E's (Evaluation, Experiential, Emotional and Engagement) attachments to the brand commitment scale are reflective (Shuv-Ami, 2012). That is, the direction of causality (Jarvis et al., 2003) relates to the calculative and affective components of commitment, and from them to the specific measures of the 4E's. Brand commitment, defined here as "a degree of attachment" to the brand, is reflected in each of the four dimensions that underline it. It is a reflective model whose dimensions reflect a high correlation (Jarvis et al. 2003). These four related constructs have been widely discussed in the marketing literature. This scale combines loyalty, involvement, satisfaction and performance to represent the degree that the 4E's are attached to the brand or brand commitment. From the above theoretical research therefore it is hypothesized here that:

**H1**: Four oblique factors - involvement, satisfaction, loyalty and performance - suffice to account for covariations of the brand commitment scale items.

The second hypothesis attempts to establish the nomological validity of the brand commitment scale suggested in the current research. This scale's validity is tested against four variables: overall attitude, the preferred brand, purchase intention and recommendation.

Models and theories of consumer behavior (e.g., Howard and Sheth 1969, Oliver 1999), suggest that attitude affects satisfaction and loyalty, which in turn affect preference. Since satisfaction and loyalty are part of the commitment scale (as constructed in the current research and as suggested by Allen and Meyer (1990), it is methodologically valid to hypothesize that compared to the uncommitted consumer, most committed consumers will display a higher overall regard and preference for the brand they are committed to. In the “Customer Development Process” model (Kotler and Keller, 2009, p.157), clients who are members in a customer club tend to be brand advocates. Similarly, Hofmeyr and Rice (2000, p.6) argued that “at a higher end of commitment, committed consumers act as advocates for the brand, exhorting others to use it.” We therefore hereby hypothesize that:
H2: The total score of brand commitment will correlate positively with overall attitude toward the brand, recommendation and purchase intentions, and brand preference.

RESEARCH METHODOLOGY

The research is based on two separate empirical survey studies, with separate and independent identities.

1. Study 1 comprised 360 Israeli basketball fans. Participants ages ranged between 17 to 77 with a mean age of 36.9 (sd = 14.2). 56% were males, while 58% had higher academic education.

2. Study 2 comprised 272 Israeli basketball fans. Participants ages ranged between 17 to 81 with a mean age of 38.1 (sd = 14.5). 59% were males, while 58% had higher academic education.

A major purpose of the present research analysis was to construct a new operationalization for the re-conceptualized brand commitment construct for fans of sport clubs. All four measures of the suggested commitment dimensions adopted from Shuv-Ami (2012) used three items on a 10-point agree-disagree scale.

Additionally, overall attitude was measured accordingly: “Please rate from 1 to 10 the way you generally feel about (think of) your team, where one indicates ‘a very poor brand’ and 10 ‘a very good brand’”. Recommendation intention was measured using a modified Markey and Reichheld (2008) advocate measure (Net Promoter Scores - NPS): “Please rate from 1 to 10 how likely are you to recommend to your friends or relatives to be a member of your team fans’ club, where 1 indicates ‘Definitely will not recommend’ and 10 ‘Definitely will recommend’”. Purchase intention was measured by the question “Please rate from 1 to 10 how likely are you to go to your team’s games next season, where 1 indicates ‘Very unlikely’ and 10 ‘Very likely’”.

RESULTS

STUDY 1: Exploratory Factor Analysis

The 12-items Brand Commitment Scale was subjected to exploratory factor analysis with oblique rotation. According to the criterions of eigenvalue > 1 and Scree test (Hair et al., 2006) four factors were extracted. On the basis of the hypothesized structure and items content, we labeled the four factors: involvement, satisfaction, performance and loyalty. These factors accounted for 88.8% of the common variance, above the recommended minimum threshold of 60%. The four factors solution is presented in table 1. With the exception of one item, all items loaded highest on the appropriate factor and had substantive loadings that exceeded .5. Only one item which presumed to reflect loyalty loaded one of the involvement factor as well. No other item found to have cross loading exceeded .4 on the non-primary factor.
Alpha coefficients for the three-item performance, involvement, loyalty, and satisfaction were .95, .93, .92, and .92, respectively. Correlations among the unit-weighted scale scores were similar to those between the factors. Correlations among the factors ranged between .66 to .86 and none of the correlation were found to exceed .90, suggesting some discrimination between the factors. The substantial correlations found between the factors justified the use of the oblique rotation and suggested higher order constructs.

STUDY 2: Nomological network

Brand commitment scale items were as in study 1 (above). The internal reliabilities for the brand commitment sub-scales were high: involvement $\alpha = .91$; satisfaction $\alpha = .92$; loyalty $\alpha = .94$, and performance $\alpha = .93$. Internal reliability for the total scale was high as well (Cronbach’s $\alpha = .96$).

The nomological validity of the basketball brand commitment scale was assessed by testing its relations with three relevant scales in its hypothesized nomological network. Table 3 presents the correlations between the research variables. As expected, results indicate significant and strong correlations between the basketball brand commitment scores and overall attitudes, recommendation, and intention. Thus, these correlations provide evidence for the nomological validity of the basketball brand commitment scale.

CONCLUSIONS AND FURTHER RESEARCH

Using Exploratory Factor Analysis (EFA) and nomological network analysis the current research established the validity and reliability of a new and multi-dimensional scale (Shuv-Ami, 2012) to measure fans commitment (4E) to their basketball team. A multi-dimensional scale of fans commitment may provide a better insight to fans behavior than previous uni-dimensional scale researches (e.g. Mahony et al., 2000; Bee and Havitz, 2010) suggested in the sport marketing literature. The dimensions of this new scale provide better understanding of four important constructs loyalty, involvement, satisfaction and performance. These constructs represent four types of attachments fans may have to their basketball club.

As for all brands, the attachment of fans to their basketball team is both functional and emotional (Rusbult and Buunk, 1993; Klein et al., 2009). While the functional aspect of the attachment represents the evaluation of the team performance ("evaluation attachment") and the satisfaction with the experience the fan has with his team ("experiential attachment"), the emotional aspect of the
attachment represents the feelings of loyalty ("emotional attachment") and involvement with everything that related to the team ("engagement attachment"). Thus the commitment of fans to their club is a composite of all of these four dimensions and not uni-dimensional.

The research suggests that brand commitment, as measured by the 4E’s scale, is a valuable and valid concept in measuring fans’ attachment to their basketball club. Future research may study the impact of this measure on each dimension of basketball team commitment with regards to fan behavior, both at the game and outside it. More importantly though, this research has, peripherally, also highlighted the need to study and analyze fans in a multi-dimensional and multi-context manner. This will not only provide valuable scholarly knowledge, but will also furnish clubs with an understanding of the fans’ true and underlying needs/wants and the means to achieve the maximum commitment; and ultimately maximize both the number of fans and the benefits to the club, per fan. It is suggested therefore that further research is undertaken with the task of delineating the fan’s profile both in terms of exhibited behavior and its causes; and to construct a comprehensive value chain/cycle incorporating all stakeholders.

In club management terms: be it towards economic, social or other type of subjectively perceived club ‘success’ (Rossi et al., 2013; Kartakoullis et al., 2013a), a club’s destiny is largely defined by its ability to build and sustain a substantial mass of fans. Where the latter are ‘real’ in the scientific, above-presented sense, it is difficult to even differentiate between the club and its fans. Their relationship is more than strong, it is symbiotic. Understanding the nature of fan commitment, and comprehending its breadth, depth and cause is key to understanding the club itself and the way forward.

LOCAL TOURISM AND SOCIAL MEDIA: THE EFFECTS OF DIGITAL TECHNOLOGY ON CUSTOMERS AND TERRITORY

Silvestri, Cecilia; Piccarozzi, Michela

Department of Economics and Management (DEIM), University of Tuscia, Viterbo, Italy

ABSTRACT

This paper aims at analyzing the impact of web tools, especially social networks, on local tourism, paying attention to the effects of the strategies used for the valorization of the territory. A Facebook page was created to promote a tourism event in the Tuscan Maremma in Italy. Its users activity has been monitored. Thanks to Insights, it was possible to analyze the increase in consumer’s personal liking of the event during two editions, 2010-2011, and the increase in arrivals and stays on the territory during the same period. The results of data analysis show that Facebook is a powerful communication tool, a suitable means for spreading information, and thus, a tool for the valorization of the territory for tourism purposes.

Keywords: Tourism, Territory, Social Network, Facebook, Consumer, Communication Tools.

INTRODUCTION

The continuous media evolution leads to endless transformation of society and economy, of production and consumption system, of companies’ organizational structure (Arnesano, 2011; Artusi, 2008; Caruso, 2003; Cercola, 1999; Ciriacono, 2000; Di Matteo and Caroli, 2001; Kotler 2007, 2011; Kotler and Armstrong, 2006). The traditional media (daily newspaper, radio broadcast…) spread information through a one-to-many system and they are characterized by poor interactivity and information asymmetry; the message, in fact, is selected by an editor and the reader/audience can not intervene or choose the contents. The limited spread of traditional media and their communication method have caused a drastic revolution in the communication system since the second half of the 90’s. Internet has grown out of many factors: the globality of the web, the rejection of one-to-many communication system and the willingness to help people spread their ideas (many-to-many communication system). Personalized communication develops. It exploits the direct contact with consumer and it enables producers to get important information on preferences, attitudes and

1 This papers the shared work of Silvestri who wrote the §1.1, 2, 2.1, 3.1, 3.2 and Piccarozzi who wrote the Introduction, § 1.2, 3.3 and Conclusion
comments about products. Thanks to the evolution of the communication tools, the internet has been gradually improved over the years, shifting from the Web 1.0, characterized by static pages, to the more recent Web 2.0 which allows users to test new functions, and finally, to the web 3.0 which uses sophisticated software for better data management (Alexandru and Acatrinei, 2011; Caruso, 2003; Chlebišová et al., 2011; Ciriacono, 2000; Fidler, 2000; Hinnis, 1982; Maurya, 2011). Micelli and Prandelli, 2000; Minestroni, 2006; Pastore and Vernuccio, 2008; Perrini, 2000; Raiport and Jaworsky, 2001; Verona and Prandelli, 2006; Miguéns et al. 2008; Milano et al. 2011; Sigala et al., 2012). The change in communication tools and in consumer behavior leads also to the change in marketing: from a passive and product-oriented marketing (Kotler, 2007, 2010;) to relationship marketing (Alvarey et al., 2011; Contaldo and Largo, 2006, Costabile, 2001, Gambetti et al. 2012; Lanier et al., 2013) and then to web marketing (Cercola, 1999; Chiarvesio and Di Maria, 2011, Croli, 2009; Cozzi, 2010; Di Matteo and Caroli, 2001; Eccleston and Griseri, 2008; Estanyol, 2012; Ferrandina, 2007; Franch, 2010; Lutz, 2011; Micelli and Prandelli, 2000; Prandelli and Verona, 2002; Verona and Prandelli, 2006).

The relationships with consumers have already been built before the introduction of internet (Aaker 1991, 1996; Busacca, 2000; Chaudhuri, Contaldo and Largo, 2006, Costabile 2001; Delgado et al., 2003; Gronroos, 1994; Holbrook 2001; Kapferer, 2004; Keller, 1993, 2003; Schmitt, 1999; Vicari, 1995) but this tool enables companies to gain important information easily, less expensively and more effectively. For the first time companies can get in touch with consumer cheaply while he stays at home in order to provide personalized information to him, to get reviews, comments and complaints. Companies can let consumers produce the product directly by creating a real dialogue with him (websites, emails, chat). Web marketing develops from that prerequisite. Ferrandina (2007) describes the web marketing as “the marketing applied to the web; the set of techniques and tools which allows developing market relationships through the internet”. The traditional communication tools enable companies to reach a large amount of users and potential consumers, but a poor segmentation is created. On the web, defining exactly the target is necessary in order to build a customer relationship based on confidence and to provide the most personalized product to the customer (Chiarvesio and Di Maria, 2011, Cozzi, 2010; Croli, 2009; Estanyol, 2012; Franch, 2010; Kotler et al. 2010; Lutz, 2011; Qirici et al. 2011; Zarabara, 2009).

THEORY

Tourism industry has been one of the first sectors to recognize the potential of internet for its business. Online tourism success depends on many factors, including very competitive prices, differentiated offer and new services offering. All these factors have gradually changed users attitudes (Abella-Garce’s et al, 2004; Baloglu and Pekcan, 2006; Buhalis, 2003; Cozzi 2010; Elliott and Boshoff, 2009;
Hussein, R. et al, 2012; Martini 2005; Qirici et al. 2011; Scorrano, 2011; Verdinejad, et al. 2011; Zarabara, 2011). Getting, producing and spreading information are very important actions for the tourism activity. An effective information management is fundamental because of the intangibility of tourist products and services, and the distance between tourist products/services and consumers (such a distance can generate an elevated risk perception during the purchasing phase) (Alkharabsheh et al., 2011; Cozzi 2010; Crowston and Myers, 2004; Drèze and Zufrýden, 2004; Martini 2005; Niemann et al., 2008; Scorrano, 2011; Thébault et al., 2013).

Technology evolution has several effects on tourism. The information is more accessible, the consumers can compare products with tourist destinations more and more explicitly and they can organize their holiday all by themselves (Abella-Garcés et al, 2004; Elliott and Boshoff, 2009; Hussein, R. et al, 2012 Kotler et al., 2007; Patricia, 2008; Primorac et al., 2012; Smithson et al, 2011; Yu-Lun et al. 2012 ).

Finally, travel arrangements through travel agencies tend to decrease because of the availability of online holiday packages.

Tourism is an international economic sector and the most extended one. The sector of international travels generates a turnover of more than one trillion dollars and counts more than one billion travelers (Kotler et al. 2010). Technology helps boost tourism and guarantee traveler’s positive experience during the holiday.

The most innovative tourism companies use technology to redefine their organizational structure (running cost optimization) and to foster the relationships with their business partners in order to generate value for their customers. The potential of the internet to promote and sell tourist products is closely related to internet usage and diffusion among the final consumers. In 2012 more than two billion online users were counted1. Online commercialization initiatives undertaken by traditional producers and tourism companies (Tour Operators, Travel Agencies) represent a threat to traditional brokerage companies such as retail travel agencies. The whole system is jeopardized by the launch and the development of online competitors and by the increasing competition offered by operators which use tools that allow independently managing the relationship with customer wherever he is, and which sell products at competitive prices through that new online tool. The consequence is a disintermediation in the tourism industry and the death of traditional suppliers (Chiappa , 2013; Cozzi 2010;Chiervesio, Di Maria 2011; Elliott and Boshoff, 2007; Primorac et al., 2012; Sanayei et al. 2011; Smithson et al, 2011).

After strong growth, even the brokerage websites that intermediate between company and customer (Venere, Expedia) have undergone a change in trend. As highlighted in 2006 by Jupiter in his research

1 [http://www.internetworldstats.com/stats.htm]
and stressed by Michelle Higgins in an article appeared in the New York Time in February 2007, online promotions have been increasing as well as people’s inclination to book directly through the website of the service provider (hotels, etc.) without needing brokerage websites. However, the presence on brokerage websites is required to gain visibility and findability (Zarabara, 2011).

Tourism services belong to that category of services that most enjoys online visibility and generates high volume of sales thanks to the internet (Hussein, R. et al, 2012 Kierzkowsky et al. 1996, Kotler, 2010; Primorac et al., 2012; Yu-Lun et al. 2012).

Tourism services are, in fact, perfect for online business. Because of their complexity, they can be placed on a website, exploiting multimedia and hyperlink communication (Clerides et al., 2008; Cozzi, 2010; Dunn et al., 2009; Elliott and Boshoff, 2007; Hills and Cairncross, 2011; Hussein, R. et al, 2012; Martini 2005; Martini, 2009; Patricia, 2008; Primorac et al., 2012; Yu-Lun et al. 2012).

The social network is a powerful tool to promote tourism. Nowadays social networks represent marketing strategies utilized by tour operators, even by those that were more skeptical towards the web because of a low knowledge and awareness about those new communication tools. The characteristics of social networks like Facebook that drive the tour operators to choose them are the following: (1) virality (interesting news or particular applications spread more rapidly and exponentially, such as viruses); (2) website’s high visitor frequency; (3) high availability of information about unique users (Facebook offers its clients a specific profile of people on the social network in order to better invest in advertising) (Bellstrom, 2011; Borgato et al. 2009, Conti 2010, De Moya and Jain, 2013; Smithson et al, 2011; Verdinejad, et al. 2011; Zehrer and Grabmüller, 2012). Facebook is a perfect virtual place for managing, promoting and spreading information about any kind of event. No matter the kind of event (a conference, a dinner for few people, a public meeting), when managing an event, Facebook is the perfect tool to spread the word, to encourage word-of-mouth, to promote attendance and to publish multimedia materials about the event (Bellstrom, 2011; Conti, 2010; De Moya and Jain, 2013; Zehrer and Grabmüller, 2012). Creating an advertising campaign on Facebook is simple, immediate and suitable for all people thanks to a platform which enables users to create an advertisement without needing an intermediary. Facebook offers a wide range of tools for every need to develop advertising/promotional campaigns. With regard to marketing and promotion, other two important qualities of this tool are the flexibility and the possibility to limit the target. Several tools are available for advertising a product, a service or a company and for finding contents outside Facebook with the aim of sharing them on the social network, increasing, therefore, the word-of-mouth (Conti, 2010). Moreover, page admins can understand if people are engaging with the content they publish. Thanks to Insights, Facebook provides page admins aggregated anonymous insights about people's
activity on their page\(^1\). This is an efficient tool to analyze and verify the impact the contents published on the social network’s pages have on users, obtaining information about tastes, attitudes and preferences of consumers.

All this is also due to the change in consumers’ behavior and tourism structures. On the one hand, the user makes a more and more clever use of the web. Some time ago, the user hardly found what he needed, now he can use websites and search engines better. On the other hand, hotel industries have improved their online marketing strategies, reaching their target directly (Kotler et al., 2007; 2010; Zarabara, 2011). As documented by the European Travel Commission\(^2\) and the research of BDRC (March 2008)\(^3\), figures explain why tourism industry should invest in web marketing as well as in territory valorization for tourism purposes.

**CASE STUDY**

The case study aims at demonstrating that the web is a valid tool of territory promotion and valorization for tourism purposes, and at verifying the impact of social networks on users. The studied event was organized to promote an Italian area of the Tuscan Maremma, in particular a municipality in the province of Grosseto. The aim was to attract the highest number of national and international guests in order to revalue the territory and the local traditions in a completely different way. The organizers wanted guests and residents to live an amazing experience and not a simple holiday. The emotional aspect and the event engagement played an important role in the event’s success. Another important aspect was the multithematicity of the event that allowed developing different tourism typologies: wine and food, sport, wealth and culture. Both editions took place in June and July. The first edition took place from July 15-18, 2010, the second one from June 24 to July 2, 2011. The choice of the time period was not accidental, but it was due to the intention of creating a captivating event during months of low tourism demand. Studies on local territory have showed that the presence of tourists on the territory is strong only in August, therefore an intervention in tourism development has been necessary in June and July. Furthermore, the research has proved that the presence of foreign tourists in July is stronger than in June. The event’s aim was also to extend the duration of the stay. Data has shown that the average length of stay is 2.38 days; the average length of stay of foreign tourists is 1.27 day more than the average of Italians (average length of stay of tourists from 2005 to 2009)\(^4\).

\(^3\) [http://www.travolution.co.uk]
\(^4\) [www.regione.toscana.it]
With regard to the communication tools utilized, the creators of the event invested much in social networks as Facebook, Twitter and Youtube in order to avoid using the traditional and static communication method that does not inspire confidence and does not communicate with people anymore. The social networks established great interaction among people who clicked “like” or followed the event’s page.

The communication tools chosen, that is web and social networks, aimed at boosting the number of real people that could know and talk about the event, fostering, then, a faster and more immediate word-of-mouth. The objective was to create a 2.0 event in which the audience could became an integral part of the show. Particular initiatives were adopted to drive tourists to generate positive conversation on the territory that hosted them.

**METHOD**

The Facebook page of the event was launched on 30 May, 2010. Through the *Insights* (a data collection that provides an overview of all the activities on the page) it is possible to analyze the increase in liking due to the powerful communication tool, Facebook, by making a comparison between the two editions. The analysis focuses on the same time frame, that is from 1 June to 31 August.

**FINDINGS AND DISCUSSION**

Few hours after the registration on Facebook, 79 users registered on the page and the next day 191 users interacted with the Facebook page. In the days before the beginning of the event the number of followers increased. On 13 May, 2013 the users registered were 1,729. When confronting data, a remarkable increase in the number of active users can be observed during the second edition. In 2011 people who liked the page increased; active users’ interaction increased daily: 439 users registered on the opening day of the event (on 24 June, 2011) and a peak of 524 users on 27 June, 2011. After the end of the event a similar growth was observed, although a sharp decrease in the number of users occurred immediately after the event and it lasted until the end of the period under scrutiny. However, the number of daily active users in the second edition increased considerably, showing a triple figures growth, as evidenced by the comparison between the first edition in 2010 and the second one in 2011. (Fig.1)
By analyzing posts, it is possible to observe that during the first edition post views were almost null, during the second edition the research shows different results. The increase in post views was also due to the help of those people who attended the event in 2010 and who contributed to word-of-mouth.(Fig. 2)

Figure 2 – Post views, 2010-2011

With regard to “likes” on posts, it is important to reaffirm that the two editions took place in different time frame. “Likes” on posts in 2010 had had steady trend for the three months taken into consideration. The trend in 2011 was not that steady. Users clicked “like” on posts especially during the nine days the event lasted (Fig. 3).
The research shows differences in the “like” source between the two editions. The main source in 2010 was fan page request, in the second edition the “unknown” sources (sources that Facebook does not include in data collection) prevailed. Moreover, more users clicked “like” directly on the web site of the event. It is clear that Facebook users search for the event page autonomously and they register by clicking “like”. (Fig.4)

Facebook Insights analyzes demographic data about the users who like the page based on the age and gender information they provide in their users profiles. The percentage of females registered on the page in 2011 was at 56.30%, reporting a 0.8% growth from 2010, which was at 55.86%. By comparing...
the demographic data concerning the two editions of the event, it is clear that the percentage of women aged between 25 and 34 years, and 35 and 44 years held steady, whereas there was an increase by 77.1% in the number of users aged between 13 and 17 years, by 10.8% in the number of women aged between 45 and 54 years, and by 23.01% in the number of people over 55 years old. The number of users aged between 18 and 24 years decreased by 20.0%. (Fig.5)

Figure 5 – Demographic data, Women 2010-2011

![Female age chart]

Source: our elaboration of data https://www.facebook.com: demographic data

Figure 6 – Demographic data, Men 2010-2011

![Male age chart]

Source: our elaboration of data https://www.facebook.com: demographic data

The percentage of males registered on the page in 2011 was at 40%, showing a 4.8% decrease from 2010, which was at 42%. In 2011 the number of people aged between 18 and 24 years (4.50% in 2010,
4.0% in 2011), 25 and 34 years (13% in 2010, 11% in 2011), 45 and 54 years (8.20% in 2010, 7.80% in 2011) decreased. The percentage of people aged between 13 and 17 years, 35 and 44 years held steady. The second edition recorded an increase in number of people over 55 years (4.20% in 2010, 5.20% in 2011) (Fig.6). Finally, by observing the graphs of figure 5 and 6, it is possible to point out that women were more engaged than men with the Facebook event page both in 2010 and in 2011. Only men over 55 used the social network more than women.

Moreover, one of the goal of the event was to captivate especially young people aged between 25 and 34 years and both editions succeeded in doing it, despite a small decrease in 2011.

Important information also concerns the countries of origin, the Facebook location data, sorted by country, about the people who liked the page. It deals with information useful to identify the potential guests and the virality of the web page.

1,463 Italians liked the event in 2011, recording a 29% increase from 2010 when they were 1,133. The number of Americans (13 in 2010, 17 in 2011), English people (7 in 2010, 16 in 2011) and Argentines (6 in 2010, 9 in 2011) increased. The number of Spaniards decreased (9 in 2010, 7 in 2011).

With regard to data sorted by Italian cities, both in 2010 and in 2011 most guests came from Rome (552 people in 2010, 636 in 2011); there was a strong increase in number of tourists from Milan (109 people in 2010, 223 in 2011).

Insights allows page admins to observe data concerning media consumption by users including “photo views” and “video plays”.

Video plays and photo views occurred especially during the duration of the event both in the first edition and in the second one. In 2010, however, media consumption also continued after the end of the event, that was probably due to the different length of the event. All this proves that users logged in to Facebook page to relive the memories of that past experience. (Fig. 7)
However, as figure 7 shows, users were more engaged in media consumption during the first edition than during the second one. Curiosity was probably what drove people to click on the posts.

Facebook page became a tool for the description and popularization of the event, showing good interaction with audience. It was a good virtual place where users could give excellent feedback about the emotions experienced.

The comparison of such data is important, the event surely reached its main goal of touching its audience emotively. The emotions were conveyed thanks to positive word-of-mouth which may be considered the most powerful advertising tool.

Another goal of the event was to increase the number of tourists in June and July on the territory. When comparing data of 2009 and 2010, it can be observed an increase in arrivals by 18.27% in June 2010, and 4% in July 2010. Data concerning presence shows an increase by 16.09% in June and 4.52% in July1. June and July gave the best figures of the last five years in terms of presence. The increase in presence was by 4.62% in June 2011 and 11.01% in July 2011, compared to 2010. Data proves that in 2011 tourists stayed longer in the accommodation establishments of the territory. Data confirms that the event succeeded in boosting the tourism sector in the studied area during June and July, a period of low tourism demand. Furthermore, the study shows a strong increase in arrivals and stays in the second edition of the event, probably thanks to positive word-of-mouth and innovative communication.

---

1 www.regione.toscana.it (2002), “Statistical information”: ARRIVALS refer to the number of guest arrivals in accommodation establishments, they represent the frequency of the demand for accommodation services. PRESENCE indicates the intensity of the phenomenon and it is measured with the duration of the stay of tourists in the accommodation establishments.
CONCLUSION

A real evolution of communication tools has occurred over the years. The Web 2.0 has led to changes
in society and it has demonstrated that the web can be a good tool to communicate with consumer.
Moreover, the Web 2.0 has played a specific role in the local marketing and in the tourism sector. The
travel product is historically a good product for sale at a distance. Internet is a perfect tool to sell
tourism products since it provides potential customers, already willing to purchase products at a
distance, with an additional way to assess the offer. In some cases, web sites and social networks have
replaced paper. Customers surf, search, buy, study, exchange opinions and ideas. Customer wants to
be informed. In an age in which it is not clear if globalization has brought advantages or
disadvantages to global economy, it is possible to affirm that the advantages are tangible in the
travel sector. Internet gives huge visibility to all online tourism providers which do not fear global
competition (contrary to other economic entities that fear it) because they sell a territory-bound
product (Zarabara, 2011).

Web presence based only on a web site is not enough to benefit business entities, it is necessary to
access many social network sites potential customers are familiar with: thanks to social networks, it is
possible to communicate with customers, making them feel important. Moreover, the web facilitates
the exchange process, reduces the waste of resources and makes the promotional activity efficient.
Customer loyalty is important in this context, actually, it is crucial. A loyal customer conveys his
satisfaction to all his contacts, talking positively about his experience. Word-of-mouth is a good tool
since it occurs among people with similar characteristics who, after having had a good experience, talk
about it to other people, creating curiosity among potential visitors. The consumer has become more
demanding, he purchases a product only after careful research, and internet is the most suitable tool
to acquire information (Costabile, 2001; Kotler and Keller, 2007).

Tourists follow such a method: they visit blog and social networks to get information, to discuss, to
dialogue, to exchange opinions. Exploiting the internet to promote a territory is a golden opportunity,
since the tourists using the web to plan their holiday are always more numerous.

For this study case the communication occurred exclusively via web (web site of the event and social
networks). The visibility of the event increased, causing a rise in the number of tourists that attended
the event in 2011.

The goal of the event’s Facebook page was to let tourists have a touching experience and it was
achieved in both editions. Users left comments on the Facebook page both during the event and after
it. Between 2009 and 2011, strong increases in arrivals and stays on the territory were registered.
Important data for the event, especially because an innovative communication system was chosen to
communicate. Facebook gave huge visibility to the event both in Italy and abroad, if considering the large number of foreign users who clicked “like” on the page.

However, the research has limitations. First, it is not possible to statistically analyze and demonstrate the level of users loyalty. Through the study of the data obtained it is proved only the level of attendance and engagement in terms of number of active users and “likes” on posts. Moreover, it is not possible to statistically determine the existence of a relationship of dependence and interdependence between the increase in arrivals and stays on the territory and the number of people who attended the event actively.

This research aims at describing the strong impact that social networks have on users and how these tools can be valid to promote and to sponsor a territory for tourism purposes. The purpose is to extend the research to measure and monitor the level of users loyalty and word-of-mouth, to compare the efficiency of traditional communication methods with the new ones (web sites and social networks) and finally, to verify the existence of a relation between communication tools and eventual increase in consumer feedback.

MODEL OF CUSTOMER BEHAVIOR ON GAMBLING MARKET – INTERNATIONAL PERSPECTIVE

Smyczek, Sławomir; Matysiewicz, Justyna

University of Economics in Katowice, Poland

ABSTRACT

Gambling holds prominent position in Western culture and is leisure activity that most adults participate in and enjoy at some level (Dickerson, Allcock, Balszczynski, Nicholls, Williams & Maddern, 1996). However over the last two decades of changes in the economic and political climate have seen rapid growth in gambling industry with legislation allowing for introduction new forms and expansion of existing forms of gambling also in transitional economies. This has result in greater availability of and access to multiply forms of gambling in the community than ever before. Changes in infrastructure on gambling market influence very strongly on gambling behavior of customers. The importance of this issue stems from the fact that may have a significant impact on income and expenditure of households. There is also very important sociological and psychological aspect of gambling behavior, particularly when it takes the form of pathology. The purpose of the paper was to investigate gambling behavior among consumers in different European countries and identify factors determining decision of consumers on gambling market. Very important purpose of paper was also identification profile of consumers making games, and verify hypothesize model of gambling behavior of consumer from European courtiers. To reach purposes presented above survey was conducted with the use of a structured questionnaire in Germany, Poland, Romania, Spain and Ukraine. The results shows that consumer behavior on gambling in European markets are strongly determined by perceived risk associated with particular gambling games. Analysis shows consumer gambling behavior as result of information processing and social interaction. And finally, the strongest influence on gambling behavior have emotional states during profit-and-loss cycle.

Keywords: gambling, customer behavior, European market

INTRODUCTION

Consumer behavior on the market of gambling and betting presents an interesting theoretical issue and an important aspect of consumer financial behavior both on the economic and social level. Gambling holds prominent position in Western culture and is leisure activity that most adults...
participate in and enjoy at some level (Dickerson, Allcock, Balsczynski, Nicholls, Williams & Maddern, 1996). However over the last two decades of changes in the economic and political climate have seen rapid growth in gambling industry with legislation allowing for introduction new forms and expansion of existing forms of gambling also in transitional economies. This has result in greater availability of and access to multiply forms of gambling in the community than ever before. Changes in infrastructure on gambling market influence very strongly on gambling behavior of customers. The importance of this issue stems from the fact that may have a significant impact on income and expenditure of households. There is also very important sociological and psychological aspect of gambling behavior, particularly when it takes the form of pathology.

The purpose of the paper was to investigate gambling behavior among consumers in selected European countries and identify factors determining decision of consumers on gambling market. Very important purpose of paper was also identification profile of consumers making games, and verify hypothesize model of gambling behavior of consumer from European courtiers. To reach purposes presented above survey was conducted with the use of a structured questionnaire in Germany, Poland, Romania, Spain and Ukraine.

CONSUMER FINANCIAL BEHAVIOR AND GAMBLING – THEORETICAL BACKGROUND

Financial behavior represents one of the most important elements of consumer behavior, since the financial aspect appears in the process of buying, borrowing or receiving goods and services. Due to financial constraints, consumers are forced to make many economic analyzes, and consequently choices connected with saving or consuming. One of the first attempts at producing a more comprehensive presentation of the problem of consumer financial behavior was made by Londqvist (1981), who developed a hierarchical four-level model of financial behavior:

- managing budget,
- making and keeping buffer savings,
- financing purchases,
- investing and accumulating wealth.

In accordance with this model, on the level of budgeting, consumers divide their income (from work, wealth, social benefits or other sources, etc) into different expense groups. In the first place, they cover the so-called non-commodity expenses, and take decisions about loan repayment, etc. The remaining part of the income (so-called acquisition fund) is spent on food, clothing, cosmetics, communication, leisure and other conventional, at a definite economic development of the society, indispensable goods and services. If these expenses do not exceed the current income, one can talk
about the phenomenon of the so-called residual savings, or, in other terms, unintended saving. If, in turn, the current income goes beyond the excess limit, the consumer enters the phase of the so-called unconscious borrowing (Foxall & Goldsmith, 2008).

On the second level, i.e. buffer savings and financial security, consumers consciously put aside part of their income as a security in case of unforeseen events and as their own or their family’s future financial provisions. In this respect, traditional consumer behavior consisted in keeping surplus funds at home, making term-deposits, or regular allocating funds on bank savings accounts. Due to current development of the financial services market, on this level consumer behavior comes down to buying various insurance policies. It is noteworthy that making and keeping savings requires financial self-restriction connected with planned allocation of part of consumer income (especially at a low income level), as well as self-discipline (e.g. abstaining from unscheduled spending of savings on current consumption) (Callebaut, 1994).

The third level of consumer behavior pertains to making expenses (achieving consumption goals). Wishing to finance a definite market transaction (acquisition of a durable e.g. a car), consumers may either save or borrow financial means. Part of consumers do not want to get indebted and prefer to save money for some future transaction, which is referred to as goal-saving. There is also a group of consumers who do not like to wait until they have saved some money for product purchase, or else do not want to use money from a deposit, so they apply for a loan or a credit (Katona, 1975). Repayment of a consumer credit for such a transaction may be treated as a form of backward saving.

The last, fourth level mainly relates to behavior demonstrated by consumers with a higher income level and refers to accumulation and allocation of capital through investments, speculations, etc. These activities are intended to gain financial benefits from high interest rate and profits (dividends) exceeding the inflation rate. At this level consumers also decide about accumulation of their assets, and turn to financial professionals and tax consultants for advice on how to maximize their capital profits and avoid paying taxes (Antonides & van Raaij 2003).

All levels of the financial behavior form a hierarchical structure, as each consumer gets involved in the first level i.e. managing cash and budget, and then, depending on his/her income level, moves on to the second, third and fourth level. Consumers who take decisions at a certain level of financial behavior are also engaged in lower levels, e.g. at the saving level they usually keep some buffer savings and manage their budget and cash in order to meet a certain goal. It is noteworthy that financial behavior of higher hierarchical levels calls for greater consumer knowledge about managing financial resources, about a market situation, as well as specificity of financial services. Additionally, all decisions taken in this respect call for bigger involvement on part of the consumer (Nicosia, 2006).
Practically, financial behavior appear in two institutional configurations, i.e. on the market and outside the market (Engel, Blackwell & Mirniard, 2006). The first configuration comprises consumer behavior on the financial services market and other types of financial behavior (e.g. paying taxes, gambling, or foreign currency speculations). Difference between the areas of financial behavior appears both on the subject and object level. The behavior demonstrated by an individual consumer encompasses exclusively decisions connected with services offered by various financial institutions such as banks, insurance companies, investment funds, brokerage houses, etc. (Solomon, Bamossy, Askegaard & Hogg, 2010).

It is worth emphasizing the fact that behavior represented by an individual is not always of consumer character. An individual is a consumer only when he or she uses definite financial services in order to satisfy certain consumer needs e.g. taking on a loan, using credit cards or buying some foreign currency for purchase of goods abroad. On the financial services market an individual loses the status of a consumer when his or her decisions are of gainful character e.g. buying foreign currency for speculative purposes, or of investing character e.g. purchasing shares on the stock market. Such behavior is referred to as productive (Nicosia, 2006).

Other types of financial market behavior include services of other organizations such as casino or lottery, as well as financial relations existing between the consumer and the state e.g. tax filing. The second institutional configuration relates to financial behavior in a household and comprises activities connected with managing financial resources and using definite financial services. Consumer financial behavior on the market (spending behavior) comprises, in turn, a group of activities relating to choices about buying/using services of financial institutions or other organizations. At that point, however, it should be mentioned that it is impossible to make a sharp distinction between consumer behavior on the financial services market and in a household. Both these areas are tightly connected and they affect each other in terms of saving, borrowing, insuring, investing or paying (Phipps & Simmons, 2007).

In developed economies, among various areas of financial behavior on the financial services market, consumer behavior occupies a special place, which explains why it has been chosen as a subject of further analyzes. This type of behavior is revealed in the process of searching, buying, using, assessing and allocating financial services which satisfy consumer needs (Wells & Prensky, 2008). The analysis of consumer behavior on the financial services market consists in considering consumer decisions about using their own resources (time, money, efforts) for buying definite financial services. This necessitates making an analysis of types of financial services used by consumers and consumer motives for using a definite financial service. It is also important to find out where, when and how often these services are used by the consumer (Swiatowy, 2006).
Consumer behavior on the financial services market occurs as a three-stage process consisting of need arousal, purchasing strategy and post-purchase behavior (Smyczek, 2007). In the first place, the consumer becomes aware of financial needs, prioritizes them and assesses possibilities of satisfying these needs. The purchasing strategy is mainly focused on searching for information in order to find possible solutions, on assessment of different financial services capable of satisfying a given need and on forms of payment. The third stage comprises the process of using a purchased service as well as consumer behavior being a consequence of satisfaction or dissatisfaction with a service (Rice, 2007).

Since consumer behavior on the financial services market is concerned with purchasing and using services, a distinction can be drawn between the behavior demonstrated by the consumer and by the buyer. It is not necessary for the consumer to personally use purchased services, whereas the buyer is not always the consumer or the user of purchased services. However, in the case of the financial services market, the service buyer is usually the service user. The inseparability of a service and a service provider proves that financial services are first sold, and later rendered and consumed at the same time (Harrison, 2000). The direct contact between the consumer provider and the consumer constitutes an integral part of the process of provision of financial services.

To sum up, it is worth emphasizing the fact that consumer behavior accounts for a big share of a broadly understood financial behavior, representing one of the most significant activity areas of contemporary people. Consumer behavior on the financial services market, and other types of market and household behavior, are tightly connected, complimentary with each other and mutually conditioned. Altogether they form an integral cycle of financial behavior intended to satisfy consumer needs. It should be borne in mind, however, that financial behavior comprises activities which include managing budget, saving, borrowing, investing, arranging insurance, filing tax declarations and paying taxes, doing extra work, speculating gambling, (e.g. foreign currency) and managing property (Antonides & van Raaij, 2003).

Despite considerable progress in the science on consumer behavior (both on the theory and teaching level as well as on the empirical one), it can be stated that so far research into consumer financial behavior has been limited mainly to analyzes related to consumer use of the market offer of particular financial institutions. In the subject literature, the problem of consumer behavior on the gambling market is raised extremely rarely.

In Polish the word gambling („hazard”) comes from the Arab language and denotes „dice” or „game of dice”. The dictionary of foreign words and phrases refers to gambling as a risky undertaking, risk-exposure, a game for money or other goods mainly determined by sheer luck (Latuska, 2001). Another
dictionary defines the concept of gambling as a risky operation the result of which is exclusively dependent on luck, or as a game of risk or exposure to risk (Doroszewski, 2000).

In the EU legislation, gambling falls within three categories, namely: games of chance, betting and gaming machines (Gambling Law, 2009). According to law, games of chance are luck-related operations where winners win money or certain goods. They include (Gambling Law, 2009):

- keno game (the game in which players win by correct marking off randomly chosen numbers and the payout value is the product of a played-in sum and a multiplier determined for consecutive winning stages),
- lotteries,
- TV bingo,
- cylindrical games (where players mark off numbers, signs or other characters and the prize depend on the predetermined ratio of the paid-in sum to the final prize; the result of the game is determined by means of a cylindrical machine),
- card games such as black jack, poker or baccarat, dice games, bingo games and lotteries: non-cash, promotional or mobile lotteries (phone calls or text messages).

Betting consists in wagering on various contest results such as sports competition with participation of people and animals, and on future events. (Gambling Law, 2009). Machine gaming comprises all types of games played on various mechanical, electro-mechanical or electronic machines, including computers. Players play chance-based games (machine gaming also comprise mechanical, electro-mechanical or electronic machines). They are designed for commercial reasons where players do not have a possibility of winning money or some goods, but the game is strictly of chance character) for money or some definite goods (in machine gaming the possibility of prolonging a game is another form of non-cash prize. Players do not have to pay in for participation in the game and can play a new game even by using a non-cash prize received in the previous game).

Bearing in mind the above, it can be concluded that consumer behavior on the gambling market refers to the courage of an individual revealed in the risk of obtaining something valuable (stake) and in his or her hope of achieving some great value, in other words, of satisfying a certain need – prize (Griffiths, 1995). It should be added that the prize or loss depend on events that are unknown to the consumer at the very moment of decision-taking.

It is noteworthy that, like in the case of consumption needs, the gambling ones are of continuous character and satisfaction of one need at a certain moment of time is followed by another urge to satisfy it again (Brenner & Brenner, 1990). Subject literature distinguishes several essential motives which stimulate the recurrence of gambling need satisfaction. The most common ones include: perceived value of money, time lapse between games, amount of money lost during the last game,
perceived probability of winning, the number of close-to-win situations, personal or non-personal nature of gambling, availability of gambling rooms, advertising or rules of a definite gambling game (Griffiths, 1995). To sum up, consumer behavior on the gambling market presents an interesting and important part of financial behavior, being one of the most crucial activities of the contemporary man.

**HYPOTHESIS AND CONCEPTUAL MODEL**

The real world setting implies dealing with an abundant complexity of financial markets, but modeling customer behavior itself presents even greater challenge. To address this complexity, the question of gambler decision making will be more narrowed focusing on relevant (but most likely interdependent) sub-questions (Lovric, Kaymak & Spronk, 2008):

1. Profiling gamblers on their preferences and risk attitude,
2. Information processing and learning,
3. Social interaction and peer influence,
4. The role of emotions and intuition.

The crucial concept for gambling, and decision making in general, is the concept of risk. Unfortunately, there are many definitions of risk with its meaning varying across different domains. In standard decision theory, a risky prospect is expressed as a set of events and event-contingent outcomes, with probabilities assigned to each event. Knight (1921) made the distinction between decisions under risk and decisions under uncertainty, with risk being measurable (quantitative) and uncertainty non-measurable (non-quantitative). However, it is possible to conceive decision under risk as a special case of decision under uncertainty, where under risk objective probabilities are used, and under uncertainty subjective probabilities are used. The most influential theories for decisions under risk and uncertainty are known as Expected Utility Theory (Bernoulli, 1954; von Neumann & Morgenstern, 1944), Prospect Theory (Kahneman & Tversky, 1979), Rank-Dependent Utility Theory (Quiggin, 1982, Schmeidler, 1989), and Cumulative Prospect Theory (Tversky & Kahneman, 1992).

Traditional economics and finance have been dominated by these probabilistic models of uncertainty. However, other theories for dealing with uncertainty, ambiguity, or vagueness exist: e.g. fuzzy set theory (Zadeh, 1965), Dempster-Shafer theory (Shafer, 1976), and rough set theory (Pawlak, 1991). Loomes (1999) suggests that the current evidence in literature is more in favor of the notion that individuals have only basic and fuzzy preferences, and that each decision problem triggers its own preference elicitation. This is in line with the claim that preferences are constructed (not elicited or revealed) as a response to a judgment or choice task (Bettman et al., 1998).
A decision maker's attitude towards risk can be characterized as risk-aversion, risk-seeking (risk-tolerance, risk-taking, risk-loving), or risk-neutrality; and can be defined in a classical sense as a preference between a risky prospect and its expected value (the method of revealed preference). In these theoretical considerations risk attitude is usually captured through the curvature of utility function, or alternatively, through nonlinear weighting of probabilities. But a strong empirical phenomena that is driving risk aversion to a large extent is known as loss aversion (Kahneman & Tversky, 1979, Markowitz, 1952). "Losses loom larger than gains," and while people are typically risk-averse for gains, they are risk-seeking in the domain of losses (Kahneman & Tversky, 1979). This highlights reference dependence, i.e. the importance of reference point against which outcomes are coded as losses or gains.

Slovic (1998) argues that although knowledge of the dynamics of risk taking is still limited, there is an evidence of little correlation in risk-taking preferences across different domains and situations. Only those tasks highly similar in structure and payoffs have shown any generality. Also, previous learning experiences in specific risk-taking settings seem more important than general personality characteristics. Furthermore, risk attitude can change depending on the outcomes of previous decisions. Thaler and Johnson (1990) found that previous gains increase risk-seeking behavior (house money effect), while in the presence of previous losses, those bets which offer a chance to break even seem particularly attractive (break-even effect). These are examples of what Thaler refers to as mental accounting. It is an important question whether gamblers have risk attitudes related to the gains and losses defined on the individual game level (narrow framing), on parts of the games (for example during one session / day), on the overall games, or on their total wealth. Accordingly,

\[ H1, \text{The gamblers perception of risk affect on creation of gamblers behavior on market.} \]

Any market participants are exposed to a constant flow of information, ranging from quantitative financial data to financial news in the media, and socially exchanged opinions and recommendations. Processing all this information is a daunting task, so it would not be surprising that during this process people apply many heuristics. According to the representativeness heuristic people may overreact to a series of evidences, and see patterns where they do not exist. However, people can sometimes underreact to news, i.e. in the light of a new evidence they update their beliefs conservatively, and not in a fully Bayesian manner (Lovric, Kaymak & Spronk, 2008).

Processing information from the environment is important as it gives inputs for decision making, it updates beliefs, gives feedback on game strategies, and fosters learning. However, the confirmation bias may play an important role in how gamblers acquire and process this information. It suggests that
people have a tendency to search for information that supports their current beliefs and decisions, while neglecting information that confronts those beliefs (Lovric, Kaymak & Spronk, 2008).

Oberlechner and Hocking (2004) study information sources, news, and rumors in the financial market. In this study consumers rated the importance of different information sources, such as wire services, personal contacts, analysts, daily newspapers, television etc. An interesting finding of this study is that the information speed, expected market impact, and anticipated market surprise are rated as more important than the reliability of the source, and the accuracy of information. According,

$H_2$, The gamblers information processing affect on creation of gamblers behavior on market.

Financial economists have borrowed more from the psychology of the individual than from social psychology (Hirshleifer, 2001). Financial theorists have examined how information is transmitted by prices, volume, or corporate actions. However, person-to-person and media contagion of ideas and behavior also seems important.

Shiller (1990) has emphasized the importance of conversation in the contagion of popular ideas about financial markets. In a survey of individual consumers, Shiller and Pound (1989) found that almost all of the consumers who use a particular financial services had their attention drawn to it through direct interpersonal communication. The influence of conversation on trading may arise from individuals overconfidence about their ability to distinguish pertinent information from noise or propaganda (Hirshleifer, 2001).

Social psychology provides evidence of various social effects which might be important in the context of gambling as well. Conformity effect, or the tendency of people to conform with the judgment and behavior of others, was studied by Asch (1956). Bond and Smith (1989) confirmed the conformity effect, showed its historical change, and emphasized its cultural dependence. Other important effects are fundamental attribution error and false consensus effect (Hirshleifer, 2001). Herding behavior or mimetic contagion has been proposed as the source of endogenous fluctuations (bubbles and crashes) in markets (Topol, 1991).

$H_3$, The gamblers social interaction affect on creation of gamblers behavior on market.

Emotions have powerful effects on decisions, and decision outcomes have powerful effects on emotions (Mellers et al., 1998). Emotions can have both a predecision and postdecision effect. Most of the research focused on a unidimensional model in which a predecision emotion can be either positive or negative. However, a more detailed approach is needed given the variety and domain-specificity of
emotions. Positive emotions are shown to increase creativity and information integration, promote variety seeking, but also cause overestimation of the likelihood of favorable events, and underestimation of the likelihood of negative events. Negative emotions promote narrowing of attention and failure to search for alternatives. They promote attribute-vs. alternative-based comparisons. One of the most studied emotions that can follow a decision is the feeling of regret. Gilovich and Medvec (1995) showed that in the short run people experience more regret for actions rather than inaction, while in the long run they experience more regret for their inactions. Anticipated emotions, such as regret and disappointment, have drawn most attention of economist, whereas immediate emotions (experienced at the moment of decision making) have been mainly studied by psychologists (Loewenstein, 2000). Loewenstein (2000) emphasizes that economists should also pay attention to immediate emotions and a range of visceral factors which influence our decisions.

One evidence for the importance of emotions in decision making comes from patients with brain lesions in regions related to emotional processing. Shiv et al. (2005) made an experiment with 20 rounds of investment decisions (choosing whether to invest 1 dollar in a risky prospect with a 50-50 chance of winning 2.5 dollars or nothing), and found that target patients (with brain lesions in emotion-related areas of brain) made more investments than the normal participants and control patients, and thus earned more on average. Normal and control patients seem to have been more affected by the outcomes of previous decision - upon winning or losing they adopted a conservative strategy and less invested in subsequent rounds. However, the inability to learn from emotional signals (Somatic Marker Hypothesis, Damasio et al. (1996)) can also lead to unadvantageous decisions such as excessive gambling. Thus, emotion and cognition both play a crucial role in decision making.

Loewenstein et al. (2001) propose "risk-as-feelings" perspective on decisions under risk and uncertainty, which differs from classical cognitive-consequentialist perspective in the sense that feelings or affects play a crucial role in decision making; emotional evaluations of risky choices may differ from cognitive, and when such a divergence occurs, they often drive behavior. Both emotional and cognitive evaluations are influenced by expected outcomes (and expected emotions) and subjective probabilities, however, emotional evaluations are also influenced by a variety of factors, such as vividness of associated imagery, proximity in time, etc.

Goldberg and von Nitzsch (2001) describe a personal experience of a trader (market participant) who goes through various emotional states during profit-and-loss cycles. The feelings of hope and fear, depending on the success or failure on the market, can be transformed to the states of euphoria or panic. During these transitional states there is a selective perception of information - positive information is perceived and often exaggerated, while negative information is ignored. In final states of euphoria or panic, information has almost no role to play (Goldberg and von Nitzsch, 2001). Even
though individuals differ, the authors emphasize that everyone runs the risk of inability to make rational decisions under pressure.

\( H_4 \), The gamblers behavior is influenced by their emotional states during profit-and-loss cycle.

![Conceptual model of consumer behaviour on gambling market](image)

**Figure 1. Conceptual model of consumer behaviour on gambling market**

**RESEARCH METHODS**

In order to verify the hypothesized model the direct research was carried out on test groups of consumers from five European countries. The study of gambling behavior on the German, Polish, Romanian, Spanish and Ukrainian markets were conducted by means of a survey questionnaire on a group of 1,000 respondents in each country. Reach were done in 2012. The average questionnaire content equaled 54%, but after verification of the material, 47% questionnaires were approved for further analysis. The choice of the countries was deliberate and based on 2 criteria: 1) legality of gambling operators on market, 2) possibilities of on-line gambling. Ukraine was selected as country with problems of legality of gambling operators on market (since 2009 this activity is illegal). Germany was selected as country with the most liberal gambling law. Spain is country which first legalized gambling online and is one of the biggest gambling market in Europe, Romania is going to legalized, and finally Poland is country, where gambling online is illegal.

All surveys were conducted with the use of a structured questionnaire, translated into national languages. The base questionnaire was designed with three parts. The first part was dedicated to behaviors of consumer on gambling market according to simply model of consumer behavior (Schiffman & Kanuk, 2010). In the second part was the use of Likert’s scale which referred to factors influence consumer behavior on gambling market according to hypothesized model. Scale to measure mentioned factors was based on literature review and previous studies (Lovric, Kaymak & Spronk, 2008). The third part describe features of respondents. Once the questionnaire was prepared, the measurements were evaluated by three experts – marketing and statistics professors, in terms of their wording/meaning and consistency.

All the collected data from first part of questionnaire were analyzed separated according to different countries because of identification differences in consumer behavior on gambling market. Data from the second part of questionnaire were analyzed together by means of AMOS 5 program. In the first place, the attempt was made to produce a set of variables responsible for the development of consumers’ behavior on gambling market. The scale included 21 variables. The scales were first
refined using Cronbach’s alpha and exploratory factor analysis (EFA). The results indicate that five item in scale was deleted due to its low item-total correlation (0.20). Other items of the scales used had satisfactory item-total correlations (>0.30) as well as Cronbach’s alpha (>0.70) (Nunnally & Bernstein, 1994). The EFA extracted four factors at an eigenvalue of 1.56 and 61.07 per cent variance extracted. In addition, all factor loadings were greater than 0.50. In conclusion, the refining step indicates that all items measuring the constructs were satisfactory. Consequently, they were used for the main survey.

In the next stage Cronbach’s alpha and CFA were used to assess the measures of constructs based on the data collected from the main survey. The Cronbach’s alphas of four constructs were above 0.64 and were respectively. The CFA results of the final measurement model indicate that the model received an acceptable fit to the data: the Chi-square value was significant (Chi-square = 591.329, df = 79, p < 0.001). A significant Chi-square, however, might be an artifact of sample size, thus other fit indices are more indicative. We present six common fit indices, guidelines regarding the indices’ recommended values, and the indices’ values for CFA models in Table 2. The indices indicate good overall fit to the data.

</tbody>
</table>

In addition, all factor loadings were significant and substantial (>0.50). Therefore, it can be concluded that these measures were satisfactory with the requirement for convergent validity. Also, the correlations between contacts, together with their standard errors, indicated that the discriminates validity was achieved (e.g., Steenkamp et al., 2003).

**MAIN RESULTS AND DISCUSSION**

In study of consumer behavior on the gambling market were taken into consideration such demonstrations of gamblers decisions as: the range of played games, needs and reasons for gambling, determinants of gambling, expenditures on gambling, and perceived consequences of gambling-addiction. The gathered information also allowed determination of a consumer-player profile.

**a) knowledge of gambling games and range of played games**

The study results have shown that consumers’ knowledge of gambling in European countries is very limited, and, to put it more clearly, created mainly by media, as the greatest number of respondents (almost everybody) have indicated such gambling games as machine games (jackpots) and casino games: roulette as well as card games. A relatively high percentage of respondents, spontaneously
referred to sports betting and internet gambling as gambling games. Interestingly enough of respondents pointed at home-played games for money as a form of gambling. However, only very limited of the questioned people identifies gambling with lotto or quiz text messaging.

<td>7.2</td>
</tr>
</tbody>
</table>

In the case of supported knowledge, almost everybody qualified sports lotteries as gambling, next to machine gaming and casino games. It is extremely surprising that despite recognizing quiz text messaging as a gambling game, majority of respondents in all questioned CEE countries have not considered it strictly gambling.

According to the study, respondents played diverse forms of gambling games, and almost all of them played the lottery. Over 50% of all investigated European countries took part in sports betting and the same number played machine games at least once in their lifetime. Nearly quarter tried internet gambling games and only few of them have visited a casino for gambling.

b) needs and reasons behind gambling

Consumer reasons for gambling are diverse country to country, but mainly related to fun and entertainment, escape from a daily routine and day-to-day problems and to leisure in the company of
friends. And only few of respondents regard gambling as a form of earning money (main income source).

**Table 5. Reasons and motives of gambling among European customers**

</tbody>
</table>

In order to confirm respondents' reference to gambling as entertainment, respondents were asked to indicate their favorite free time activities on a 7-point scale. The results have shown that respondents' beloved pastime is watching TV or films, listening to music and meeting friends. In the research, gambling was assessed as an activity which provides the lowest level of pleasure.

**Table 6. Favorite free-time activates of European customers**

</tbody>
</table>

Respondents were also requested to determine which would bring them most pleasure: winning a gambling game, winning a sports competition or a scientific or artistic contest. The results have revealed that the greatest satisfaction would be drawn from winning sports competitions and scientific and artistic contests. Only very narrow group of respondents chose gambling as the greatest pleasure-provider.

</tbody>
</table>
c) determinants of consumer behavior on gambling

The study shows that consumers habits constitute the main determinant of consumer choice of a gambling game. Other factors include distance from the place of residence and security of a transaction.

Table 8. Determinants of gambling among European customers

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Over 50% of respondents finances their participation in gambling with current earnings, 28.7% with savings and only 2.5% with money from previous winnings. It seems worrying that over 16% of respondents borrow money to be able to play the games.

With respect to financing games with current earnings, one should highlight the fact respondents approach it with caution spending on gambling no more than 25% of their income. In most cases they use 5% or less of their earnings (50.4%), or between 10 and 25% (27.9%). Only 1.7% of respondents exceed 50% of their income playing the games.

d) consumer-player profile

The main gamblers on the European gambling market are middle-aged men, with secondary education, running single or 3-member households. The players live in big or medium-size cities and obtain the income level of average.

e) consequences of gambling

As results show, majority respondents do not see any negative consequences of gambling for themselves. Interestingly enough, almost the same number of respondents perceive the threat of gambling for other people and for the whole society. In the case of negative consequences of gambling respondents pointed out harmful phenomena including family problems, indebtedness, loss of friends, works problems, theft, and fighting.

In majority of cases respondents are satisfied with gambling. Surprisingly, respondents do not trust institutions offering gambling services. According to study results, majority of respondents are determined to play various gambling games in the future. A considerably lower percentage of respondents would recommend gambling to their friends, but with respect to children. Majority of them try to prevent their children from various gambling games.

f) results in hypothesized model – testing main effects

After examination of measurements used to measure constructs, focuses of study turns to theoretical structure hypothesized. Investigation of hypotheses was pursued, basically, by levels of adjustment of theoretical model, and by significance and magnitude of estimated coefficients of regression (Hair et al., 1998).

T-values in parenthesis. Based on one-tailed test: \( t \)-values > 1.65, \( p < 0.05 \); e \( t \)-values > 2.33, \( p < 0.01 \). Coefficients in bold are statistically significant.

Results provide support for all 4 homological relationships specified in our theoretical model. These relations reflect impact of: 1) consumer perception of risk on consumers behavior on gambling market, 2) different information processes on consumers behavior on gambling market, 3) social interactions of consumers on their behaviors on gambling market, and finally 4) consumer emotional states on their gambling behavior.

In addition, table 11 shows the explained variance \( (R^2) \) for each dependent variable in conceptual model. \( R^2 \) of 0.71 indicates that construct: positive perception of risk by consumers, considerably, the variation in consumer gambling behavior. Effects of consumer perception of risk on consumer gambling behavior established in hypothesis H₁, was confirmed. \( R^2 \) of 0.67 and \( R^2 \) of 0.79 indicates positive correlation between information processing and social interactions and gambling behavior. H₂ and H₃ was confirmed. Impact of consumer emotional states on gambling behavior of customers established H₄, was supported by findings \( (R^2 = 0.83) \).

**CONCLUSIONS**

The research shows that gambling games are treated by consumers as a form of relaxation and leisure. Winning is mainly a matter of luck, whereas skills play a marginal role. Consumers try to behave rationally on the gambling market. They finance their gambling operations predominantly with current earnings and in gambling they follow their own habits and take into account transaction security. Gambling is perceived as a gripping activity, and therefore respondents would like to protect...
their children from the access to different forms of gambling. Nonetheless, they would recommend the games to their friends.

The results shows that consumer behavior on gambling in Europe are strongly determined by perceived risk associated with particular gambling games. Analysis shows consumer gambling behavior as result of information processing and social interaction. And finally, the strongest influence on gambling behavior have emotional states during profit-and-loss cycle.

From practical point of view, the research shows that managers of casinos and other gambling institutions should focus on educational activities of consumers in Europe, concerning scale of their activities and strategy building consumer trust to those institutions. Consequently, information strategies should be developed and focus on consumer information processes and social interactions. Finally, gambling institutions in Europe should convey to consumers their responsibility for children protection against gambling.

It should be borne in mind that this research has some limitations, which, however, can be turned into an opportunity for future research. Undoubtedly, future research should be more intensely focused on investigating what should constitute viable gambling behavior in the context of well-developed and transitional economies. Similarly, it may be necessary to consider and embark on research into the most effective campaigns for proper gambling activities. Ultimately, it is the research that is likely to inform policymakers on the most sensible strategies to be implemented. Invariably, this calls for further research in different countries from the region as well as for comparative analyzes to be made between well-developed countries and countries in emerging markets. In addition, it would be proper to commence with a more comprehensive study of consumers’ perception of how they win, loss and manage money.

INWARD EXPORT – A CONSUMER ANALYSIS ON SERVICE SATISFACTION

Sousa, Catarina; Meneses, Raquel
School of Economics and Management, University of Porto, FEP, Porto, Portugal

ABSTRACT
The aim of the present study is to provide further research on the inward export phenomenon, giving considerable attention to what drives the foreign consumer satisfaction in the service home country. Such phenomenon is common among tourism companies that internationalize without leaving their home country, meaning that the consumers have to travel to the service home country. This conceptual paper shows that several services may affect the foreign tourist stay, which can have different impacts on their overall satisfaction. Not only the core service, but also other complementary services, as well as, its surroundings, might have an influence on how the consumer perceives their visit and therefore, on their will to return. Thus, this study provides a broader understanding of consumers expectations so service companies can respond to or exceed such expectations, and consequently, leverage their position leading to consumer overall satisfaction.

Keywords: Inward export, consumer satisfaction, service quality, international service strategies, tourism.

INTRODUCTION
Globalization and internationalization have been very scrutinized themes over the past decades (Welch and Luostarinen, 1988; Andersen, 1993; Whitelock, 2002; Etemad, 2004; Knight, 2004; Lang, 2006; Negrea, 2012). Following this line, and taking into consideration the growing importance of services in internationalization, many authors have studied several topics on this matter, like international barriers, modes of entry and drivers of international performance (see Lommelen and Matthysens, 2005; c.f. Bianchi and Drennan, 2012). Such research, although very important, leaves behind one aspect that underlines some service industries like education, tourism or healthcare (Björkman and Kock, 1997; Bianchi, 2010). There are a number of service companies that, due to a location’s unique feature or the impossibility of dislocating the service abroad, require that the consumer has to physically travel to the service home country (Björkman and Kock, 1997). This inward movement, named importing customers (McLaughlin and Fitzsimmons, 1996), inward export (Björkman and Kock, 1997) or domestically located service exports (Roberts, 1999), comprises service companies where producing
and consuming are simultaneous activities and occur in the home country of that entity (Bianchi and Drennan, 2012).

At the service level, customer satisfaction might elucidate on service quality. It can also be source to improve market share, profitability and positive word-of-mouth, increase purchase and preserve consumers (Anderson et al., 1994; Oliver, 1997 in Bianchi and Drennan (2012)). And, as Bianchi and Drennan (2012) conclude in their investigation, customer satisfaction is not only a result of functional attributes from the core service, such as service performance but it is also influenced by elements of the peripheral service, like the relationship between customers and service providers.

As mentioned above, tourism can be one service sector that falls within the spectrum of inward exports, as the foreign consumer has to move to the service home country to experience it (Björkman and Kock, 1997). This sector can be an instigator for domestic firms to develop knowledge on foreign consumer behavior and create international promoters, allowing some small companies to overcome internationalization barriers (Poulis and Yamin, 2009). Additionally, it is to remark that the Portuguese tourism sector shows a dynamic growth and has an important contribution on Portugal’s economic activity (Sustainability Reports, 2010, 2011). According to the Sustainability Reports of 2010 and 2011 from “Turismo de Portugal”, the tourism consumption on the Portuguese economical territory represented about 8.8% of its GDP in 2009, and about 9.2% in 2010. The same organization mentions that the balance of trade for tourism was about 5.7 billion Euros in 2012 and grew to 6.1 billion Euros in 2013, and the goal is to have an average growth of 9.5% per year until 2015. This expected dynamic makes the tourism a compelling sector for research and understanding.

In summary, this study will concentrate on the global service strategy of inward exports, focusing on the tourism sector, to explore what drives the satisfaction of the foreign consumer in the service home country. Thus, it seems eloquent to question: what are the determinants and their weight on the tourist overall satisfaction at the service home country?

This conceptual study is then divided in two parts, whereas the first presents a description of the global service strategies and the second part concentrates on the inward export strategy, describing the different services that might affect the foreign consumer satisfaction.

**LITERATURE REVIEW**

Throughout literature services are defined as being intangible when comparing to products, but as Shostack (1977) underlines this may not be the main distinguishing characteristic. This is, as the author also concludes, because some services have important tangible elements that will influence the “reality” of the service in the consumers mind. The complexity associated to services, whether it is their intangibility or the degree to which services are embodied in goods, makes them more challenging to
internationalize, and entities should detach from a product marketing approach (Shostack, 1977; Vandermerwe and Chadwick, 1989; Bianchi, 2011). Additionally, Cicic et al. (1999) argue that it is the characteristic of inseparability (production and consumption are simultaneous activities) that has the biggest impact when selling services abroad.

Lommelen and Matthyssens (2005, p. 97) define international service as "a service that is offered in foreign markets and/or to foreign customers" and there are several categories for services' internationalization strategies.

Global service strategies

According to McLaughlin and Fitzsimmons (1996) service firms can chose between five strategies to internationalize. A first strategy proposed by the authors, named multicountry expansion, seems pertinent when consumers have to physically travel to the service facility in order to benefit from it. Commonly, this strategy replicates the home country service in several locations but it requires a special attention in terms of the front-office, since it is important to adapt to the local culture.

A second strategy underlines that some service companies choose to internationalize following their corporate clients, which may require the service firm to adapt their service package and employ people that are sensitive to the local business practices (Fischer, 1991; Cooper and Lybrand, 1992, in McLaughlin and Fitzsimmons (1996)). Nevertheless, as McLaughlin and Fitzsimmons (1996) suggest, this strategy might create a tunneling vision because the service firm can ignore potential markets with growing middle classes, leaving competing local companies free to provide for them and if successful, they may become international competitors.

Service offshoring is another global service strategy and it can be defined as the outsourcing of a service in a foreign location (Fitzsimmons and Fitzsimmons, 2011). The offshore of back-office activities is very common because of their informational nature, which makes them prone to be executed anywhere in the world, leaving the company to focus on its core business (McLaughlin and Fitzsimmons, 1996).

A fourth global strategy is "beating the clock" and "describes the competitive advantages gained owing to the fact that one can bypass the constraints of the clock and the constraints of the domestic time zones, including time-based domestic work rules and regulations" (McLaughlin and Fitzsimmons, 1996, p. 54).

Finally, importing customers sustains on the concept that, due to a location's unique attribute or the impossibility of moving the service to another country, consumers will have to travel to the service home country (Björkman and Kock, 1997).
Inward export

Whether it is called importing customers (McLaughlin and Fitzsimmons, 1996), inward exports (Björkman and Kock, 1997) or domestically located service exports (Roberts, 1999), in all of them prevails the idea of foreign clients being "forced" to move to the service home country so they can enjoy the service. For example, tourism, healthcare and education are services that fall within the spectrum of the internationalization strategy in analysis (Björkman and Kock, 1997; Bianchi, 2010; Heung et al., 2010). Bianchi and Drennan (2012) underline that for such service firms, production and consumption are simultaneous (the 'moment of truth') and take place in the service providers home country (see also Kandampully and Promsivapallop, 2006). Thus, it becomes essential for the firm to develop the foreign language skill and cultural sensitivity during customer-employee contact, and "transportation infrastructures and logistics management will be required to accommodate the visiting customers" (McLaughlin and Fitzsimmons, 1996, p. 52). For these service firms, McLaughlin and Fitzsimmons (1996, p. 52) argue that "differentiation will occur through customization and complexity of the service".

As some authors conclude, there can be several factors that consumers take into consideration when choosing a destination, whether it is a service like education or tourism (Heung et al., 2010; Bianchi and Drennan, 2012; Peña et al., 2012). For the present study, these factors are divided between: core, peripheral and facilitator services, and surroundings.

The core service

Some service companies possess unique features concerning the environment where the company is located and firm specific resources and/or capabilities that prevent the service to be transferable across borders (Björkman and Kock, 1997; Roberts, 1999; Bianchi, 2010, 2011). Specifically, service's infrastructures (Björkman and Kock, 1997; Heung et al., 2010) and atmosphere (as, for example, the Valamo Monastery in Finland (Björkman and Kock, 1997)) influence service quality and firms reputation, as well as marketing and communication strategies and cultural intelligence (Bianchi, 2010). These firm specific resources are distinctive features and portray the core service (the reason for the company to exist) that stimulates the foreign consumer to travel abroad (Patterson et al., 1998; Kandampully and Promsivapallop, 2006). The core service can be the most important determinant for customers overall satisfaction, as Patterson et al. (1998) conclude for foreign students in Australia. In such study they verify that the interviewed students take greatly into consideration the learning experience and their achievements as students. Rahman and Shil (2012) also demonstrate that the core service is very important, since young consumers prefer to visit a natural park in Bangladesh by themselves, dismissing the tour guides offered by the park.
The definition of inward export has underlying a high involvement between service provider and customer at the moment of production and consumption (Bianchi, 2010, 2011; Bianchi and Drennan, 2012). This ‘moment of truth’ can be important to develop a good relationship between them, especially the first contact, which can be the foundation for a satisfied client (Yung and Chan, 2002). In their study, Styles et al. (2005, p. 122) argue for service firms with high face-to-face contact that some performance drivers "(...) were high levels of customer service, interpersonal skills, and a local presence in some form”. On the other hand, Roberts (1999) states that, due to the high face-to-face contact when exporting, the service company should have cultural sensitivity, local knowledge, desire to protect intangible assets and confidentiality. As for the consumer, when moving to the service home country, he will be faced with a new and uncertain environment which may lead to conflicts that emerge from cultural differences and communication errors during the delivery process (Bianchi, 2010, 2011). The findings of the same author reveal that cultural differences, besides creating miscommunication, may mislead consumers’ expectations and in consequence, lead to dissatisfaction. Thus, it is important for service firms "(...) to have a thorough understanding of individual international market preferences and needs, and adapt properly to market variation to achieve long term performance” (Bianchi, 2011, p. 287). For example, Heung et al. (2010) argue that medical facilities should meet consumers expectations, providing a medical care of international standards. To achieve that, as the authors also state, the destination place should have a good communication structure and multilingual employees. Nevertheless, these service companies cannot dismiss the domestic consumers as they can be a relevant portion of their revenues, like Björkman and Kock (1997) note that only 7 to 10 percent of the customers are foreign at the Valamo Monastery in Finland.

The peripheral services
Kandampully and Promsivapallop (2006) discuss in their study that customer needs are becoming more complex and so, service firms should broaden their core service offering by having non-core supporting activities. For example, Bianchi and Drennan (2012) conclude that international students satisfaction (or dissatisfaction) can be a result of services like accommodation or personal services (such as health services) when in the host country, which are neither a part nor can be controlled by the core service, the school. Still, such services can be an opportunity for the service company to gain a competitive advantage (Kandampully and Promsivapallop, 2006). Moreover, Heung et al. (2010, p. 237) declare that for medical tourism, even though the core service is the “medical treatment, attractive hospitality and travel options are also essential” which would require an efficient coordination between the healthcare and tourism sector.
In this line, Kandampully and Promsivapallop (2006) define peripheral services as a combination of goods, services and experiences that complement the core service, and can either positively or negatively, influence the consumer’s evaluation of the service (Gabbott and Hogg, 1996; Kandampully and Promsivapallop, 2006). On the other hand, Patterson et al. (1998) states that the peripheral services are other services related to the consumers stay in the domestic country of the core service (the one that stimulates the consumer to travel) necessary for the consumers survival in the new country. These peripheral services have a great impact on overall customer satisfaction (Gabbott and Hogg, 1996; Anderson et al., 2008; Bianchi and Drennan, 2012) and may influence how consumers view the core service (Reimer and Folkes, 2009; Bianchi and Drennan, 2012). Jin et al. (2012) strengthen this idea by concluding that service firms can benefit greatly when they highlight in a service package, the customized peripheral attributes that the consumer can enjoy.

For example, Rahman and Shil (2012) studying the satisfaction of young tourists visiting a natural park in Bangladesh, conclude that the food service is important for their satisfaction, particularly if it they were price friendly and portrayed national culture. In a study about rural tourism, Peña et al. (2012) verify that the perception of a destination to a rural tourist is influenced by the offer of complementary services, such as cultural services (like monuments, museums, concerts), activities in the nature (like mountain sports, water sports, etc.) and gastronomy offer.

Facilitator services

Service quality and consequently consumer satisfaction, is commonly accessed only after purchasing or during consumption (Parasuraman et al., 1985). Zeithaml et al. (1993) discuss four factors that influence consumer expectations: past experience, explicit service promises (such as advertising), implicit service promises (for example, price and tangibles associated to the service) and word-of-mouth. On the other hand, consumer perceptions of the service vary with customers characteristics specifically, demographic (such as age or genre) and situational (like previous experience) characteristics (Anderson et al., 2008). Thus, it is important that service companies choose carefully their communication strategies, as they can be a way of attracting foreign consumers to the domestic market, besides having an influence on their expectations and consequently, on their satisfaction (Zeithaml et al., 1993; Bianchi, 2010, 2011). Communication activities can be performed through travel agents, participation in trade shows, exploit of the internet, direct marketing, international visits by service company staff and establishing relationships and partnerships with relevant social actors (Björkman and Kock, 1997; Bianchi, 2010, 2011).

Another important input to transmit to customers what the service can be is, as mentioned before, word-of-mouth (Zeithaml et al., 1993). This type of communication conveyed by consumer reports,
friends or family (Zeithaml et al., 1993) is the most influencing communication activity to attract foreign
customers to the service home country. Bianchi (2010) concludes such in her investigation,
demonstrating that over 50 percent of overseas customers were recruited through word-of-mouth.
The inward export strategy requires the foreign consumer to travel to the service home country and so,
tourism offices (Meiriño et al., 2013) and transportation infrastructures need to efficiently assist the new
customers (McLaughlin and Fitzsimmons, 1996). In their investigation, Bianchi and Drennan (2012, p.
103) demonstrate that some foreign students were satisfied because of the good transportation system
in Australia, since “it [is] quick and saves time”, as quoted by one student. Contrarily, Meiriño et al.
(2013), studying Ribeira Sacra in Spain as a tourism destination, notices that consumers were unhappy
with the public transportation services because they were scarce.
All these points (communication activities, travel agents, transportation infrastructures, tourism offices)
are then proposed as facilitator services, which help the foreign consumers to be aware of the core
service and facilitate their arrival at the new country, so they can experience it.

**Surroundings/Environment**
In their study, Vajcnerová et al. (2012) present four dimensions to evaluate the quality of a tourism
destination, being one the influence that the environment has on the consumer, to which they call
attractions. This dimension includes natural and cultural-social attractions, for example weather and
cultural facilities, respectively. Likewise, Bianchi and Drennan (2012) determine that the good weather
was a determinant of students satisfaction, whereas Meiriño et al. (2013) conclude that safety, a peaceful
environment, hospitality and the historical patrimony were influential as well.
Lichrou et al. (2008) propose that tourism destinations should be viewed beyond an aggregate of
services, attractions, infrastructures, activities and environmental resources. In turn, the intangible and
dynamic properties of such place should be considered, as they can have cultural and symbolic
meaning to consumers. Nevertheless, when the foreign consumer has to physically travel to a new
country and experience a new culture, there is a possibility that differences may arise when he/she
meets with other consumers or with other service providers (Bianchi, 2010, 2011). For example, Bianchi
and Drennan (2012) note while studying international students satisfaction, that some students felt
discriminated or not accepted by local or foreign people as they were experiencing transportation
services (see also Patterson et al., 1998).
These previous mentioned singularities characterize a location and create a picture for the customer of
the environment they will enjoy. Björkman and Kock (1997) note in their study of the Arctic Safaris Ltd,
that is the Northern Finland’s nature that enables consumers to experience the uniqueness of what that
service company has to offer. This country-of-origin effect is an important differentiation factor for consumers, like Bianchi (2010) concludes when students choose Australia as a base for their education.

CONCLUSION

As demonstrated previously, there are different types of services that influence the consumer overall service satisfaction. For example, Peña et al. (2012) demonstrated, for rural tourism, that three particular dimensions influence how the consumers perceive a rural destination: the unique rural environment, the characteristics of the services demanded and the complementary services/activities that consumers can experience (such as culture and gastronomy). On the other hand, the model created by Heung et al. (2010) shows that there is a combination of services from both the demand and supply side that affect a consumers’ choice for a particular destination when it comes to medical tourism.

Moreover, there are diverse opinions on how all these services affect consumer perception and on the weight they represent to overall satisfaction. Some authors argue that core and peripheral aspects of a service have an asymmetric influence on consumers evaluation of the overall service (Gabbott and Hogg, 1996; Yung and Chan, 2002; Kandampully and Promsivapallop, 2006; Jin et al., 2012). This is justified by the fact that there are (core) elements of the service that the consumer is expecting to enjoy, so little weight they would have on their satisfaction, being the peripheral services the major contributors to overall satisfaction. For example, Anderson et al. (2008), performing a study on air travel industry, demonstrate that both core and peripheral services "are significantly associated with increased overall satisfaction" (p. 374) but a variable related to the core business, the flight environment, is not. In contrast, there is also evidence that the core service has very big impact on customer (dis)satisfaction (Patterson et al., 1998), particularly when consumers think that some core elements are absent (Gabbott and Hogg, 1996; Yung and Chan, 2002), which discourages consumers to enjoy such service.

In summary, and due to the different determinants of consumer overall satisfaction, which varies from the core service, to peripheral services and to service facilitators, Model 1 is proposed (see Figure 1). The core service is what drives the consumers to travel to the service home country (Patterson et al., 1998) and are the service attributes which the consumer is expecting to enjoy (Gabbott and Hogg, 1996). The peripheral services, on the other hand, are other services related to the core service that the foreign customers need for their prolonged stayed in the new country (Patterson et al., 1998). It is also proposed that facilitator services are those necessary to invite and facilitate the arrival and stay of the foreign consumer, meaning that these services are the ones that initiate the process of the inward exports, like communication strategies (Björkman and Kock, 1997; Bianchi, 2010, 2011). Lastly, the surroundings are
another proposed variable that influences the consumers’ permanence at the new country, since they can also affect their perceptions of service quality.

As mentioned previously, literature shows some divergences on how these different services affect overall satisfaction, so it is suggested that, as consumers’ experience services that are “further” from the core service, its influence on their satisfaction can either augment or diminish. This means, respectively, that consumers may give greater value to complementary services as opposed to the core service, or give more importance on core attributes of the service and less to other attributes, as it follows the line in Figure 1. Additionally, it is expected that services less centered to the core service will have a smaller impact on consumers’ choice to travel to the service home country. So in Figure 1, it is proposed that the attractiveness of a service will diminish from the core service to the surroundings, unless the consumers’ impulse to travel to the service home country came from a desire to enjoy the weather or the natural/cultural scenery of that country.

Figure 1. Service determinants of foreign consumer satisfaction

EVALUATION OF THE NATIONAL HIGHER EDUCATION SYSTEM’S COMPETITIVENESS: THEORETICAL MODEL
Stonkiene, Marija1; Matkeviciene, Renata1; Vaiginienė, Erika2
1Vilnius University, Lithuania
2Research Institute for Changes, Lithuania

ABSTRACT
Purpose: This article aims to evaluate the peculiarities of the national higher education sector and propose a theoretical model for the evaluation of the competitiveness of the national higher education system. The proposed evaluation model for the evaluation of the competitiveness in the national higher education system has been designed by adapting the diamond model suggested by M. E. Porter. M. E. Porter’s diamond model has been adapted by taking into account the fact that although higher education is market-driven, higher education outcomes are related to the public interest, thus, the assurance of the functioning of the higher education system is the area of public responsibility. M. E. Porter’s diamond model has been modelled taking into consideration the specificity of higher education.

Design / methodology / approach: The research is based on literature review.

Findings and originality / value: The theoretical novelty of this article is associated with a new concept of competitiveness in the national higher education system and with a new theoretical model applied to evaluate the competitiveness of the national higher education system.

Keywords: Higher education, higher education system competitiveness

INTRODUCTION
Researchers involved in the analysis of the development of higher education systems draw attention to the fact that globalisation, the increasingly growing costs for public sector (including higher education), the actualisation of knowledge economy, are changing performance of higher education sector’s perception and evaluation, operating conditions, functions and mission of the institutions of higher education, resulting changes in the national higher education systems, alterations in the national higher education policies and new strategic goals set for the sector (Globalization and Education: Critical ..., 2000; Globalization and Educational Restructuring ..., 2003).

Under the influence of the changing social conditions the majority of world’s national higher education systems have undergone changes that resulted in altered objectives of the participants of this sector, i.e., to increase the competitiveness of these systems, to ensure a special status of higher
education institutions in the national systems and the world, to increase their capacity to attract sources alternative to state funding (Deem, Mok, and Lucas, 2008, p. 83-84). J. L. Demeulemeester notes that the change in the national higher education systems is characterized by certain common features: reductions in state funding, introduction of a new ratio of education funding provided by students and state resources, introduction of new public management, increase in internationalisation and others (Demeulemeester, 2011, p.p. 2).

The scholars note that the application of neo-liberal ideology is primarily applicable to the changes in higher education funding (Ferlie, Musselin, and Andresani, 2008; Deem, Hillyard, and Reed, 2007; Schimank, 2005, et al.). B. Jessop, N. Fairclough and R. Wodak argue that the market-based neoliberalism involves the promotion of entrepreneurship in the higher education sector, the application of new strategic paradigms promoting the attraction of investments in higher education development and, as a result of these developments, the changes in management of the higher education system (Jessop, Fairclough, and Wodak, 2008, p. p. 30). The analysis of the competitiveness of higher education phenomenon reveals that scientific works do not present concept of higher education competitiveness, and dominating multi-aspect definition of the field shows that the competitiveness of higher education, its research and evaluation suggest new complex (interdisciplinary or even multidisciplinary) themes in the field of higher education research.

The objective of this article is to present a model of the analysis of the competitiveness of the national higher education system. This objective aims at discussing the peculiarities of higher education in defining the concept of competitiveness in higher education system, analysing and introducing M. E. Porter’s diamond model adapted to carry out the research of the competitiveness of the national HE system.

PECULIARITIES OF HIGHER EDUCATION SYSTEM, FORMING A UNIQUE CONCEPT OF HIGHER EDUCATION COMPETITIVENESS

Traditionally, higher education in Europe has been part of the state-led social policy, ensured by public funding (Reforming higher education..., 2004). The conception of higher education as a field of public responsibility has been developing under the influence of a concept of higher education as part of public well-being, based on both the classical university tradition of free education and the interference of the state in arranging and providing higher education.

The emergence of globalisation and the rise of knowledge-based society had a major impact on the systemic and institutional changes in higher education systems (Globalization and Educational Restructuring..., 2003), especially in growing market tradition in higher education (Shin, Harman, 2009). In summary, the studies of the impact of globalisation on higher education carried out by...
various scholars, have identified the following crucial change of directions in higher education triggered by globalisation:

- massification of higher education;
- change in higher education management (privatisation included);
- change in responsibility and accountability for the quality of higher education;
- internationalisation of education;
- ranking of higher education institutions (Shin, Harman, 2009, p. p. 3).

Scholarly insights account for the emergence of pre-conditions for the global competition as well as conditions for its development or a continuously emerging trend of global competition in higher education. S. Marginson notes that an open information environment, the development of networked relationships that strengthen international flows do not indicate the existence of an international education system, the local context is important for the interactions between universities or activities of knowledge-based clusters (Marginson, 2004, p. p. 176). S. Marginson argues that the local context leads to a new corporate autonomy of a number of universities from the illiberal state institutions (Marginson, 2004, p. p. 176). The importance of the national context is attributed to national resources and national needs. To define these intertwined contexts of higher education as well as the impact of their elements on higher education sector, S. Marginson and G. Rhoades have introduced a new term – glonacal (glonacal = global + local + national) (Marginson, Rhoades, 2002). This approach allows to identify the peculiarities of global competitiveness in higher education: creating of opportunities and conditions for institutions of higher education to compete on a global scale increases their competitive potential on the local and national scale; enhancing of the global competitiveness of higher education institutions can be ensured by national resources, global competitiveness can be affected by the activities of higher education institutions at the national level. The suggestibility of the higher education system to the global, local and national contexts indicates the potential sources for raising competitive advantage initiatives that emphasizes the specificity of competitive conditions provided for the higher education system and indicates the potential peculiarities characteristic to the evaluation of the competitiveness of the higher education system that requires distinctive approaches to measure competitiveness.

Market ideology applied in higher education and being promoted by globalisation is based on the economic neoliberalism doctrine that ascribes the significance to market power, deregulation, seeks reduction of public expenditure on higher education as well as on other social services and the input of new higher education funding sources. Neo-liberalism in higher education is primarily associated with the idea of academic capitalism where any institution or professional attempts under the market conditions or marketlike conditions in order to raise funds alternative to public funding from the
The Future of Entrepreneurship

budget (Slaughter, Leslie, 1997). The idea of academic capitalism is based not only on commercialisation of scientific knowledge in the market (patenting, licensing or establishing *spin-off enterprises*, etc.) or marketlike conditions (obtaining funding by grants, establishing various partnerships of higher schools and business organisations, raising funds from tuition fees, etc.), but also includes other activities of higher education institutions that are changing the interaction between higher schools and their social environment. Market relations in higher education are characterized not only by the idea of academic capitalism but also by the concepts of new public management and entrepreneurial universities (Deem, 2001).

The researchers, while highlighting the advantages of the input of market relations in higher education, note that the application of the neo-liberal ideology is primarily associated with positive changes in higher education funding (Ferlie, Musselin, Andresani, 2008; Deem, Hillyard, Reed, 2007; Schimank, 2005, et al): the change in the activities of higher education institutions, the development of their entrepreneurship, the promotion of competition among higher education institutions, higher education systems (higher education institutions, being the participants of the higher education system compete to attract academic resources, commercialise scientific knowledge, academic services).

Another advantage of market ideology is that the market assigns resources to research on a competitive basis, which leads to the usability of scientific knowledge, research, i.e. specific potential commercial benefits.

However, in addition to the advantages of market relations in higher education, possible negative consequences of the input of market relations are visible: the limitation of access to scientific knowledge due to commercialisation, the restriction on innovation diffusion, potential threats to academic freedom, the underestimation of fundamental research, the training of specialists of narrow specialisation, the advent of specialised research. Subsequently, the shrinkage of higher education as a public good, accompanied by declining public support is identified as a negative impact.

This means that, seeking to meet the public interests of the university, the cost-benefit paradigm should not to deny the distinctive approach to higher education as a public good, but ensure the fulfillment of satisfying the public interests delegated to higher education institutions and include other public expectations traditionally attributed to higher education as the area of public responsibility (e.g. fundamental research should be considered as the public good, to ensure a broad dissemination of the findings of scientific research, the establishment of higher education institutions, the diversity, applicability of higher education results, the availability of higher education, etc.).

The experts of the World Bank note that even though higher education and other public sector institutions compete with each other for the state budget funding, the financing of higher education from these resources remains important for three reasons: the investment in higher education
provides benefits in terms of economic and social development; the market disadvantages largely influence inaccessible loans to part of the students; higher education is important for the development of basic and secondary education (*Constructing Knowledge Societies ...*, 2002, p. 76). Taking into account these peculiarities of higher education as that of an area of specific activity, while dealing with the concept of higher education competitiveness, it is appropriate to evaluate the aspect of the competitiveness of higher education as a whole of long-term economic and social welfare growth conditions. The involvement of the higher education system in the process of increasing the state (public) welfare requires the input of not only the needs of the market, but also of the social state (society needs) aspect into the concept of the competitiveness in higher education. So, it is assumed that higher education competitiveness is related not only to economic factors as a whole, but also with the development of the context – the environment of the political, social and other capacity of higher education. Therefore, it is argued that neo-liberalistic access based on the change of operating conditions of higher education institutions forms a distinctive (specific) concept of higher education competitiveness.

The examined peculiarities of higher education define the specifics of the concept of higher education (including higher education sector) competitiveness. A.Kemnitz draws attention to the fact that the scientific literature shows little interest in the investigation of competition of the higher education sector (Kemnitz, 2004). Scientific research carried out on the issues of higher education competitiveness focuses on different aspects of competitiveness of the higher education sector – educational service market problems (Adelman, 2000; Marchese, 2000, et al.), the impact of demographic factors on higher education (Altbach et al., 2009 Swailes, 2001, Keller, 2001, et al.), tuition fees (Geiger, 2004, Hughes, 2011, Ehrenberg, 2000), changes in higher education funding (DelRey, Racionero, 2010, Curs, Singell, 2010, Johnstone, 2004 et al.) or changing priorities of the state, international organisations, assigned to the relevant fields of scientific work. Scholarly attention is low in discussing the concept of higher education competitiveness as there is no detailed evaluation of the competitiveness of the higher education system, sector or institution, or factors forming a competitive edge. Having evaluated the operational peculiarities of the higher education sector, the fact that the evaluation of the state performance as that of the competitive entity, involves a relevant component of public interest satisfaction, it is believed that the construction of the concept of competitiveness of the higher education system should include the know-how of modern definitions of the states’ competitiveness.

Therefore, it is appropriate to comprehend the competitiveness of the national higher education system as the capacity of the higher education system to create, maintain and develop the higher education environment in which the higher education system can compete not only nationally, but
also globally as well as increase the welfare level of the society, the public. This concept is based on the establishment and assurance of the operating environment of the higher education system, i.e., providing the conditions for competitive operation of the higher education system. The interaction of the national higher education system and the state competitiveness enables to evaluate the application of the state competitiveness research models in order to explore the competitiveness of the national system of higher education.

**M. PORTER’S DIAMOND MODEL ADAPTED TO EVALUATE THE COMPETITIVENESS OF THE HIGHER EDUCATION SYSTEM**

*M. Porter’s diamond model* is one of the most widely applied instruments for the evaluation of the competitiveness designed primarily to assess the national competitiveness, later adapted to evaluate the competitiveness of economic sectors (Porter, 1990).

This model evaluates the internal and external factors that create the advantages in the context of global market: internal factors such as demand conditions (consumers and their specific needs), industrial sectors, as well as the strategy, structure and competitiveness of the entity (depending on the country's legal conditions, the country's cultural peculiarities), and important external factors are considered to be the state institutions (the government) and opportunities.

While evaluating the feasibility of M. Porter’s *diamond model* in examining the competitiveness of the national higher education system it is necessary to take into account the peculiarities of the national higher education system. Given the peculiarities of the outcomes of the performance (mission) of the higher education system, considering competitiveness of the higher education system (higher education sector, higher education institutions) as the ability of the system of higher education (higher education sector, higher education institutions) to create, maintain and develop the higher education environment in which the higher education sector is not only able to compete, but also raise public and state welfare, the analysis of the national higher education system’s competitiveness should assess both, the competitive conditions ensuring the capacity of the higher education system and the higher education system’s ability to respond to the goals related to satisfying the public interests, set by the society and state, as well as to increase the level of the public and state welfare.

Considering the fact that the higher education system’s operational outcomes are significant to both the public and the state it should be noted that the development of conditions facilitating the growth of competitive capacity of the system of higher education, first of all, depends on the state policy and the performance of state institutions. The role of the state institutions is associated with the elimination of information asymmetry shortcomings that are characteristic to the market (or quasi-market) of higher education, so the assessment of the competitiveness of the higher education system
higher education sector) must include the discussion of state activities in the field (the accreditation of higher education institutions, the assessment of the quality of the performance, the external evaluation of all activities, actions directed to satisfy the public interest). Apart from the fact of the higher education sector's ability to generate financial resources as significant in terms of the diversification of income sources, raising funding sources alternative to state budget funds, also important to point out that the investigation of the conditions that ensure competitive edge of national higher education system, the conditions offered to higher education institutions must be evaluated first, as well as the given opportunities to compete for funding alternative to state budgetary financing (both for higher education and research).

The application of a mixed approach: based on resources and competencies, is considered to be the most appropriate in examining the conditions that boost the competitiveness of the national higher education system.

The application of the approach requires to evaluate appropriate competencies and the quality of the performance relevant to both carrying out the missions of higher education and managing the system of higher education, the higher education system's ability to create and maintain diversity in the system of higher education (in terms of its institutions, courses, etc.). It should be noted that the status and prestige of the system of higher education (higher education institutions) is related to assessment of the quality of competencies of higher education system and performance of appropriate activities.

Attention is drawn to the fact that the assessment of the competitiveness of higher education highlights the competition among higher education institutions providing educational services, whereas the competition of institutions carrying out scientific activities (research) is not based on the assessment of institutions, and is only visible in the competition with regard to the financing of activities.

The highlighted aspects in the assessment of the competitiveness of the higher education system (sector) require the adaptation of M. E. Porter's diamond model that is based on the belief that it will be possible to apply it in researching both the entire system and the higher education as an economic sector, however, is considered that in order to assess the competitiveness, the presence of the market (or quasi-market) is the condition necessary in both cases.

The adapted M. E. Porter's diamond model (Figure 1) shows that the development of the national higher education system (sector) is considered to be an integral part of a complex network that includes a variety of public life sectors of the national state that play an equally important role in increasing the state's economic competitiveness and implementing other significant efforts to create welfare state.
Figure 1. M. E. Porter’s diamond model adapted to examine the competitiveness of the national higher education system (sector) (developed by the authors by M.E. Porter's diamond model)

In this model one of the external factors, i.e., the government institutions (the government) are seen as a partner which role in the system is essential: the national system of higher education depends on the decisions made by the government institutions. The impact made by the governmental institutions is associated with other sectoral policies influencing the development of the higher education system. Another external factor - the opportunities – is conceived in the model in their traditional meaning, as unexpected events affecting the change of a competitive ability or a competitive situation.

The internal factors of the national higher education system (sector) are considered to be the internal factors that play a decisive role in operational activities of the higher education system (sector):

- **Factors of production** of the higher education system (sector) that are perceived as the resources and competencies (the input) necessary to carry out the higher education system’s (sector’s) functions (defined by distinguishing the traditional university missions, i.e., teaching and research). Resources and competencies can be identified as the resources and competencies of the teaching and research quality or the resources and competencies of the status of the national higher education system. These resources comprise both the country’s basic factors (geographic location, demographics, etc.) and general factors (developed general economic infrastructure as well as the infrastructure of higher education system, intellectual capital, et al.) and specialisation factors (e.g., skilled human resources, crucial for their specific skills, advanced research, study methods and techniques, innovation, etc.), important evaluating aspects of the resources are those of resources development, renewal as well as the speed of use and efficiency. A distinctive resource of the higher education system...
system is those seeking for higher education, their “quality” directly related to the operational quality of the higher education system and the evaluation of the outcomes received from this system. Therefore, the “factors of production” include the higher education system’s international cooperation, participation in research networks, arrangement of international education, attraction of foreign students for study, attraction of foreign scientists, professors to participate in the study process of the national higher education institutions.

- This model presents the conditions for the demand of the outcomes of the higher education system’s (sector’s) performance in terms of the applicability (marketability) of the learning (study) outcomes and research findings of the higher education system; this internal factor can be defined as the output of the third university mission: the applicability of the outcomes of the higher education systems is associated not only with meeting the market needs, but with satisfying the public interest, so the evaluation of the outcomes of the higher education system’s performance should take into account the fact that only part of these outcomes can be evaluated by economic categories or quantitative indicators.

- Two other internal factors: 1) the higher education system’s (sector’s) management, funding, structure and 2) the higher education system’s (sector’s) accountability, accreditation, assessment are closely inter-related as they indicate the significance of the role of the state in the system of higher education and describe the importance of this role.

The assurance of the efficiency of the national higher education system is associated with the management, structure and financing of the higher education system (sector), (similar coverage limits are observed in the factor derived by Michael E. Porter’s diamond model): the conditions governing the higher education system’s (sector’s) operating conditions as well as conditions for higher education institutions in terms of their establishment, management, performance and financing from the state budget funds, indicates the volume and characteristics of the competition taking place between the participants operating within the system (sector) of higher education.

Other internal factor that is considered to be accountable for satisfying the public interest of the national higher education system, in accordance to Michael E. Porter’s diamond model is shown as a factor comprising the serving and related industrial sectors. The relevance of the accountability of the higher education system (sector) is associated with the accountability of the higher education system (sector) as that of the entity operating in the sphere of satisfying public interests. The accreditation and evaluation are related to the duty of the state to ensure the rights of higher education consumers. All together, this internal factor can be described as that of public agent institution’s (Cave, Kogan, 1990, p.p. 183).
Adapted Diamond model by Michael E. Porter to examine the competitiveness of the national higher education system (sector) is intended to explore the environment in which higher education systems (sectors) not only compete but also seek to improve the welfare level of the society, the public.

DISCUSSION AND CONCLUSIONS

The analysis of the scientific approach to factors determining competitiveness reveals that of a variety of concepts of competitiveness correlates with diverse theoretical sources available one valuation of competitiveness. The internal and external economic factors, economic characteristics are considered to be most significant.

Undoubtedly, the analysis of the competitiveness of the higher education sector like that of any other sector of the economy, involves such significant factors as the general macro-economic factors revealing the context of the higher education system, the analysis of which is relevant in forecasting the performance of the higher education sector. When applying the approaches that examine the competitiveness of the economic sector proposed by the scientists to investigate the competitiveness of the higher education system should evaluate the peculiarity of higher education, i.e., meeting the public objectives and public interests, as have been already discussed. It is believed that the traditional economic sector approach related to the pursuit of economic benefits, applied for the competitive assessment of the higher education sector is hampered by the features of the higher education sector.

The application of the method (with appropriate exceptions) to measure the advantages of systems’ performance indicators are possible only in evaluating the national competitiveness of the entities of the higher education sector (higher education institutions). Globally, the method applied to measure the advantages of the performance indicators in the higher education sector is hindered by the peculiarities of the national higher education systems, differences in higher education sectors of the nations. It is believed that the assessment of the competitiveness in the higher education sector should apply the approach that evaluates the competitive advantage of the existing system with its legal, political, economic, social and other factors. The appropriateness of this approach is based on the development of higher education environment that encourages, enables and ensures a competitive higher education system that will take an active part in increasing the standard of public (society) welfare and satisfying the public interests.

The article proposes a model for examining the higher education system (including higher education institutions) that assigns significance to the assessment opportunities of higher education as that of a system: the assessment of the performance of higher education institutions and factors that determine their performance (human, financial, material and other resources; management, leadership, etc.), the ability of higher education institutions to monitor the environment (performance of other higher
education institutions, the system of higher education, the performance of other public sector institutions; interpretation of policy/decisions made by the state institutions) and, depending on the changes in the environment to introduce internal changes (the ability to compete on services, human resources, etc.).

The analysis of the components of the competitive model adapted to the higher education system highlights the component of human resources (researchers, higher education administrators, lecturers, students, etc.): the overall competitiveness evaluation system is based on the human competencies, ensuring the performance of higher education institutions, its assessment, potential demand or final outcomes. One more aspect is worth mentioning - the assurance of public welfare: the competitiveness of the higher education system does not determine profit of any particular organisation, but targets at developing knowledge as a basis for the creation of new knowledge, development of exclusive competencies, i.e., the sustainability of the system is ensured on the basis of the circulating knowledge within the system, resulting in the creation of added value to society and the state.

The issues of competitiveness in the analysis of the higher education system (especially – of the institutions) are associated with both global and local context, emphasis is laid on the benefit gained from the development of competitive environment resulting in changes introduced not only in individual sectors of the economy, but also in the state. The application of this scientific approach to the assessment of the competitiveness in the higher education system signifies the relevance of evaluating both the local and global contexts. The higher education sector's competitiveness is unique due to the exceptional role of the state (government): state's (government's) role may be crucial in determining the structure, operating principles of the overall higher education system. The analysis of scientific model targeted at the evaluation of the applicability of higher education research activities, for the competitiveness evaluation revealed that the financial and international cooperation aspects are observed as the most significant aspects in assessing competitiveness in this area of higher education. These important aspects are also evaluated by the proposed adaptation of M. E. Porter's diamond model.

A high-quality higher education system which involves active participation of the public at large is a mandatory requirement to ensure the state's development and international competitiveness.

UNDERSTANDING WOMEN ENTREPRENEURS WORKING IN A
CONFLICT REGION

Sultan, Suhail Sami

College of Business and Economics, Birzeit University, Palestine

ABSTRACT

Purpose: The main purpose of this research is to get a thorough and deep understanding of women entrepreneurship working in an Arab and conflict country such as Palestine.

Methodology: The study used the quantitative method. The researcher distributed 100 questionnaires on a group of women who are categorized as being entrepreneurs and who own and run their businesses. The judgmental sampling technique used to select these women, based on prior knowledge of the researcher and use of different networks.

Findings: The results of the research paper show that Palestinian women have positive perception towards entrepreneurship. Women start their businesses driven by opportunity rather than necessity. The main characteristics of women entrepreneurs' enterprises are more likely to be in consumer oriented businesses, and small ventures hiring between 3-10 jobs. Culture, and access to finance are the main challenges of women entrepreneurs.

Practical implications: Understanding women entrepreneurs will assist decision makers in Palestine to issue policies to eliminate the barriers these enterprises are facing. Therefore, number of entrepreneurs will increase and economic situation will improve.

Originality: Due to the lack of literature discussing women entrepreneurship in Middle Eastern context, the research discusses women entrepreneurs based on the particularities of conflict regions such as Palestine.

Keywords: Entrepreneurship, Women, Palestine

INTRODUCTION

While a lot of studies identifying women entrepreneurship success factors have been carried out in advanced countries, economic research on entrepreneurship in developing economies is less developed and only a few studies have used a rigorous scientific approach. The presence of women around the world driving small and entrepreneurial organizations has had a tremendous impact on employment and on business environments worldwide (Minniti & Arenius, 2003). However, it is still the gap in the research and dissemination of information about female entrepreneurship. Nearly one-
third of all the businesses in the formal economy are women-owned, and women entrepreneurs are expected to be playing an even larger role in informal sectors (Bowen & De Clercq, 2008). In recent years, there has been a considerable and growing interest in entrepreneurs and entrepreneurship (Davidsson, 2006) at both national and international levels because it symbolizes innovation and a dynamic economy (Gnyawali & Fogel, 1994). Nevertheless, the topic of female entrepreneurship has been relatively neglected both in society and the social sciences, despite the fact that generations of women from across the world have contributed to their environment, demonstrating encouraging signs of entrepreneurial spirit (Global Entrepreneurship Monitor, 2004). In Palestine, women’s entrepreneurship is increasingly recognized as an important factor for economic growth and development. However, the number of women entrepreneurs in Palestine are relatively low, due to a number of factors. Palestinian women entrepreneurs face obstacles, despite deliberate attempts by the Palestinian Authority to encourage female entrepreneurship.

**OBJECTIVES**

Women’s entrepreneurship, particularly in Palestine, deserves attention, in order to access an underutilized resource and increase economic growth, entrepreneurship can offer new opportunities for women and hence generate income and create wealth for themselves and their families. Thus the main objective of this research is to get a thorough and deep understanding of female entrepreneurs in Palestine.

**METHODOLOGY**

In order to understand women entrepreneurship in Palestine, the researcher used different sources and methods for data collection:

Secondary data. Where the researcher relied on surveying the literature relevant to the topic, including the statistical tables, publications issued by governmental and non-governmental organization, research papers, articles and editorials.

Primary data. The researcher distributed 100 questionnaires on a group of women who are categorized as being entrepreneurs and who own and run their businesses. The judgmental sampling technique used to select these women, based on prior knowledge of the researcher and use of different networks.

The aim of this questionnaire was to get a thorough understanding of the factors affecting women. The main points that were tackled in the questionnaire are: (a) influencing factors in the decision to launch a venture; and (b) problems encountered by female business owners.
LITERATURE REVIEW

Palestine consists of two separated parts: West Bank and Gaza Strip. In the fourth quarter of 2013, the unemployment rate in Gaza Strip was 31.0% compared with 20.3% in the West Bank, and the unemployment rate for males in Palestine was 21.2% compared with 35.3% for females. The highest unemployment rate in the fourth quarter 2013 was 41.1% among youth aged 20-24 years. For years of schooling, the unemployment rate among females with 13 years of schooling or more was 46.7% (PCBS, 2014).

Although Islam declared woman capable of exercising all her rights with no exception and to pursue her social and economic activities, yet, women in Palestine, like women in many Middle Eastern countries, struggled against inequality and restrictive practices in economic participation and family roles. Many of these unfair practices and limitations are said to originate from local cultural traditions (Haber & Reichel, 2007), and creating obstacles towards rights and liberties reflected in laws dealing with criminal justices, economy, education and health care.

This is due to many factors. Some of which are: the slow growth in the region influences economies towards low demand for female labor. In addition, the traditional view that men are the breadwinners further obstructs the employment of women and contributes to an increase in women’s unemployment relative to men; the uncertain security situation and internal political tensions (Freedomhouse, 2010) imposing constraints on women and limiting their access to employment opportunities, freedom of movement; and the Arab culture that defines the roles of men and women, men are expected to support their families and women to take care of house and family and hence culture promoted that the right place for the woman is her house.

In Palestine, there is no law that prohibits women’s work or ownership of a business exists. However the business environment is still highly affected by gender issues. Women entrepreneurs have their fair share of challenges and constraints that hinder their economic participation and thus make their contribution rates lower than men. Nonetheless, the situation of women in Palestine has seen lots of changes, all aiming at improving the overall status of women. More women are turning into entrepreneurship and hence contributing to the development and economic growth of their country.

In Palestine, as all Arab women entrepreneurs, are faced with external barriers such as lack of financing, exclusion from male-dominated informal networks and the social attitude that business ownership is a male activity. Such barriers are mainly informal barriers based on cultural norms, values and customs (Mohsen, 2007).
DATA ANALYSIS

Women aged 25-35 are the most entrepreneurially active. It is noticeable that the involvement in entrepreneurial activities decreases with the increase in age, where women aged 55-64 are the least active. As well, it is noticed that entrepreneurial activity increases with education, till it reaches its highest rate among secondary certificate holders (40%), the highest second rate is for completed university degree holders (18%) and then college/technical category (12%). Almost (40%) of the respondents started their own businesses without having any previous experiences while (25%) of the respondents were working in full time jobs and (35%) were engaging in part time jobs. In Palestine women who are living in rural regions (almost 60%) are more entrepreneurially active and (80%) of them are married.

For many individuals, the entrepreneurial process starts with a personal assessment dealing with attitudes and perceptions towards entrepreneurship. In Palestine, women (80% of the respondents) have a positive attitude towards entrepreneurship. When women were asked whether people perceive starting a new a business a desirable career choice, the majority of women were very positive about it.

Starting a business requires some basic skills such as planning, technical skills, marketing and monetary skills. When women were asked if they think they have the required skills to start a business, (60%) of the respondents showed that they are still struggling to get their basic needs. When women were asked whether fear of failure would prevent them from starting their own businesses, the answers showed moderate rate (50% of the respondents).

Women were asked if they started their businesses due to “necessity entrepreneurship,” which has to become an entrepreneur because you have no better option, from “opportunity entrepreneurship,” which is an active choice to start a new enterprise based on the perception that an unexploited or underexploited business opportunity exists. Women in Palestine are driven by both motives and with the same intensity, and this is due to unstable political situation leading to worsening economic situation, creating need for capturing any opportunity in the market to start a business and, at the same time, to alleviate poverty and support family on one side and as a substitute for employment.

Almost (80%) of the respondents did not create jobs while (20%) created (1-5) jobs. It is predictable because, the majority of the respondents are working in consumer oriented firms and in business services with almost no activities outside Palestine.

Women in Palestine are looking for better standards of living. They realized the particular nature of their societies and endeavored to achieve for themselves what others can’t do it for them. When women were asked about what made them launch their ventures, the answers is to alleviate poverty especially with the unstable political situation which contributes to deteriorating not only women’s
status in the community but the stability of families in specific and society in general. Table (1) presents the influencing factors in the decision to become entrepreneurs.

Although the percentage of women-owned enterprises is in increase, yet women are still facing many constraints and difficulties that may hinder the growth and development of their businesses. Women were asked to specify the problems they encounter in their attempt to manage and run their ventures. Table (2) presents the main challenges that are facing women to start their own businesses.

Women are faced with cultural limitations that restrict their image to a typical housewife. There was almost a consensus among women on the role played by the prevailing culture on holding them back not only in terms of owning and running the business but when it comes to their rights in movement, joining workforce, political participation and freedom of choice. They believed that norms, traditions and attitudes of the conservative society pose a burden on them. They feel their societies still perceive them as housewives no matter how educated they are or how successful in their businesses they are.
The traditional role puts another limiting factor on women entrepreneurs which is the work - home role conflict. The combination of two jobs, one at work and one at home, is difficult for women in Palestine where poverty and lack of infrastructure can make the most basic tasks harder and time-consuming for them.

Lack of training, information and support services also perform against the growth of women’s entrepreneurship. Women stated that they don’t possess the required knowledge or skills of a successful businesswoman though they believe that they cannot grow without the right tools and skills and at the same time, they find it hard to acquire these skills, due to its cost or scope.

Access to finance poses itself as a hindering factor in addition to the complicated and bureaucratic business registration process. Women feel it is more difficult for them to access finance and they sensed gender-discrimination especially when applying for loans from banks, who, according to women, require male guarantor and to provide more collaterals. Also, when they seek funding from their families or friends, they feel they are not sometimes taken seriously. However, on a positive side, they expressed “somehow” their satisfaction with micro-credits organizations, due to their “softer” stipulations compared to banks.

Though there is no law that forbids women’s ownership of business of any type, however women believed it is the applications of these laws that slow down their entrepreneurial endeavors. Women expressed their dissatisfaction with the mechanisms with which laws and regulations are applied.

Another factor that may hold up women’s venture’s growth is the complicated and cumbersome business environment. According to the Palestinian women, procedures are complex, length and costly, i.e. obtaining licenses and permits. Paying taxes and bankruptcy and exit procedures, all are working against them and hence may drive them towards the informal sector.

Other hindering factors are the political instability and war threats, lack of skilled and dedicated labor, the limited market expansion opportunities, poor infrastructure, and lack of access to technology and innovation.

FINDINGS AND RECOMMENDATIONS

FINDINGS

1. The demographics of the early stage women entrepreneurs can be described as, educated with post-secondary certificates and higher, their age fall between 25-44, married, live in the urban areas.
2. Women have positive perception towards entrepreneurship.
3. Fear of failure is moderate among women.
4. Women start their businesses driven by opportunity and necessity.
5. The main characteristics of women entrepreneurs’ enterprises are 1) more likely to be in consumer oriented businesses, 2) small ventures hiring between 1-5 jobs.
6. Women entrepreneurs are claiming culture, access to finance, and business environment as the main challenges to start their businesses.

RECOMMENDATIONS

The main recommendations are the following:
1. The society should change its norms and attitudes towards women entrepreneurs
2. Banks and microfinance credit institutions should pay more attention to women entrepreneurs
3. The Ministry of National Economy should restructure the procedures to support women entrepreneurs
4. Further research should focus on informal women entrepreneurs.

THE PATH OF SUSTAINABILITY STARTS FROM BENCHMARK DESTINATIONS

Tardivo, Giuseppe; Scilla, Angela; Viassone, Milena

Department of Management, University of Turin, Italy

ABSTRACT

Literature largely accepts that the future competitiveness of destinations will depend on their ability to take advantage of their economic, natural and cultural resources in a sustainable way. For these reasons, managers often seek to establish strategies and operational procedures leading the achievement of a sustainable competitive advantage for tourist destinations. Even though the tourism sector is not the typical field where the benchmarking methods are widely used, such approaches could be successfully if they will be applied to evaluate destination sustainability and to manage the performances of tourist destinations. This paper aims at providing a descriptive and prescriptive framework of features that a destination pursuing the path of sustainability should develop. We proceed with a systematic analysis of related literature and analyzing 82 awarded European tourist destinations for sustainability in the last 5 years. Our goal is the creation of a set of best practices for tourist destinations, thus providing also an important contribution to the literature.

Keywords: Tourist Destination, Benchmark, Sustainable Destination, Tourist Strategies, Ecolabel.

INTRODUCTION

Despite the difficult economic scenario characterized the last 7 years, especially for advanced economies,, the tourism sector confirms its positive trend as one of the fastest growing sectors in the twenty-first century, generating the 9% of world GDP. (Wto, 2014). In 2013 it has experienced, a year of further strengthening of international tourism (1.087 billion), an increase of 5% compared to the previous year. Europe has attracted the largest number of tourists (563.4 million, +5,4% than 2012), becoming the most visited region in the world with 52% of all international arrivals, a growth rate of 5% in Europe is remarkable including many comparatively mature destinations. Tourism receipts grew by 4% in real terms, accounting for 42% of receipts worldwide (WTO, 2014).

For the reasons we had explained, tourism continues to be an important driver of development, prosperity and well-being (Weaver, 2006; Scheyvens and Momsen, 2008): it enhances economic growth and encourages local development by increasing employment and national income (Szivaz et al., 2003; Torres and Momsen, 2004; Na Sakalnakorn and Naipinit, 2011).
But a competitive challenge among several destinations is shaking the tourist sector. Each tourist destination, who want to win the challenge and to maintain its competitive advantage, has to plan some strategic actions to be taken. This strategic planning must ensure a balance between the quality and quantity of a supply, and balance it with a corresponding level of demand respecting socio-economic development, environmental factors and sustainability.

For these reasons, managers often try to establish strategies and operational procedures leading the achievement of sustainable competitive advantage of tourist destinations, including benchmarking techniques (Kozak and Rimmington 1999). The main goal of regional governments and destination management institutions is to succeed in this competitive struggle by increasing the competitiveness of their destination. The quality of strategic planning and final strategies become a key factor of competitiveness.

The combination of competitiveness-sustainability is particularly emphasized in the context of tourist destinations and it assumed, therefore, an important role in the international literature of recent decades (Franch et al., 2010; Hong 2009; Enright and Newton, 2005; Ritchie and Crouch 2003; Hassan 2000).

The aim of this study is therefore to identify the features a tourist destination has to possess or develop in order to follow the path of sustainability. Benchmarking techniques allow the detection of these characteristics and, even though they are not widely used in the tourism sector, such approaches could be successfully applied (Luštický and Kincl, 2012).

To achieve our aim we will apply a qualitative analysis based on the literature review and on the study of factors influencing the economic, social and environmental sustainability of a tourist destination.

**THEORETICAL BACKGROUND**

According to Godfrey and Clarke (2002), sustainability becomes a synonymous of competitiveness in a long term. So, providing tourism destination with sustainability allows its development and enhancement in long-term.

To control the effects and consequences of tourism decisions, managers and territorial Actors need to be informed. They may use several indicators, as quantitative measures and qualitative reports, that serve as managerial tools in the process of tourism development. For example, through these information and data, they can (Jurdana, 2011):

- identify easily some important and urgent problems in order to undertake appropriate measures;
Tourism industry not only needs economic indicators but also environmental and social change indicators: they not simply measures current conditions but also serve as “early warning” devices to alert managers of imminent problems (Jurdana, 2011).

Tourism theory recognised the basic importance of environmental quality to ensure the future existence of most kinds of tourist destinations. Tourism managers have been willing to incorporate environmental measures into current management strategies and methods because they can generate lower costs (first aspect) and/or higher revenues and profits (second aspect).

The first aspect usually refers to energy, water and other resource saving programs and thus, in many cases, it results in cost reductions; it is also economically attractive for environmental managers and easily supported by business and political forces located at the destination. The second aspect requires higher environmental awareness, more information and co-ordination, public management and substantial (public) financial resources; it is much more exacting and expensive to manage. It also requires a long-term view; it brings present costs and future benefits (Mihalič, 2000).

According to literature, the sustainability of a tourist destination must be measured, identifying some economic, environmental and social indicators (Butler 1991; Pigram 1990; Carbone, 2005; Weaver, 2006; Schevenes and Momsen, 2008; Jurdana and Frleta, 2011; Albu 2012).

Guidelines of sustainable prizes and ecolabels contain several of these sustainability and competitiveness indicators.

Normally, the main function of ecolabels or sustainability prizes in tourism is to attract tourists, they are a factor of consumer choice, but accreditation may also be used as a criterion by regulatory agencies to grant permits; promotion agencies for their inclusion in marketing campaigns; and insurance underwriters to issue policies and set premiums. (Buckley, 2002).

As a sustainable development tool, it has some advantages, such as showcasing good practice and encouraging voluntary improvements; it also has its drawbacks, such as the fact that it is not equitable and efficient (Sasidharan et al., 2002).

The criteria allowing to obtain sustainability prizes can become successfully guidelines for local actors and managers in strategic planning for sustainable development of their tourist destination. Benchmarking with other tourist destinations would allow, with a systemic point of view, the creation of a virtuous cycle for the long-term development.

RESEARCH MODEL
The research question of the present study is:

Q: What are the main features that a destination choosing to be sustainable should follow?

This objective is particularly important because current literature doesn’t propose a shared illustrative framework to be followed by destinations which pursue the path of sustainability.

This objective is achieved throughout a qualitative research based on a review of literature and on a frequency analysis of the several factors affecting destination sustainability of 82 benchmark European destinations (awarded with important sustainable prizes), classified in five macro-areas: environmental management, eco-tourism/natural assets, supporting assets, cleaner production and tourism carrying capacity. Table 1 shows sample characteristics (Tardivo et al., 2014).

SAMPLE DESCRIPTION

The sample used in our research is composed of 82 benchmark European tourist destinations awarded in the last five years with the six most important prizes for sustainability:

- Environmentally Sustainable City Award, that aims to reward the adoption of higher standards of sustainable development for cities;
- Blue Flags, a voluntary eco-label awarded to more than 3850 beaches and marinas in 48 countries across Europe, South Africa, Morocco, Tunisia, New Zealand, Brazil, Canada and the Caribbean;
- Eden European Destination of Excellence, a project promoting development models of sustainable tourism across the European Union;
- Tourism for Tomorrow’s Awards, one of the world’s highest accolades in the Travel & Tourism industry, aimed at recognizing best practices in sustainable tourism within the industry worldwide;
- European Green Capital Award, an award for a European city based on its environmental record;
- European Prize for Tourism and Environment, a prize that the European Union assigns to destinations belonging to Member States that distinguish themselves for these two assets.

The sample is composed of variegated tourist destinations (towns, regions, beaches, etc.) and this heterogeneity allows to determine the main common characteristics that make them excellent. Even if we consider in our analysis only awarded European destinations, this sample could be considered representative for our purposes since they provide guidelines to follow for tourist destinations voted
to sustainability. At the same time, focusing our analysis on the European area allows us to operate with comparable and accessible data.

For each destination we have collected data about the six above-mentioned factors, each of whom classified in 4 to 11 sub-factors that can assume different levels (i.e. for the water shortage the levels are high, on average and low; for networks are excellent, good, scarce, etc.). In this way, it has been possible to compute the frequency registered by the different levels of each sub-factors. We got the value of each index directly by the websites of the different awards or by the tourist website of each destination. We decided to analyze only those factors and sub-factors that satisfy criteria of accessibility and comparability; this means that only sub-factors available and computed with the same methodology in all the Countries have been considered in our analysis.

ANALYSIS AND DISCUSSION OF RESULTS

Results show how each dimension registers the highest percentages in particular features that can constitute a framework for sustainable destinations that would like to become a benchmark in this field. In Table 1 we can notice how, as long as the dimension of environmental management is concerned, all destinations register an efficient energy supply and the presence of tourism ecolabelling; this last one is considered a valuable environmental management tool in tourism (Buckley, 2002; Font, 2002) and can be present in the form of ISO 3166-2; UNI EN ISO 9001:2008; UNI CEI 11352, UNI-EN-ISO 14001, eea, ISO 50001, UNI EN ISO 9001. UNI EN ISO 27001. ECOLABEL and EMAS (university and hotel). Despite this, they are too expensive, they require time and their criteria focus on environmental management (Synergy, 2000; Tardivo et al., 2014).

With the term “ecotourism” we refer to “ecologically sustainable tourism with a primary focus on experiencing natural areas that foster environmental and cultural understanding, appreciation and conservation” (Ecotourism Australia, 2003). It shows (Table 2) the highest percentages with respect to high nature conservation, emphasized by Spilanis et al. (2014) as the preservation of the ecosystem capability of providing humans with goods and services essential for their survival and for the local quality of life. In the same way, also increasing tourist development is present in 96% of destinations, symptom of their efforts to invest more and more in this sector. A very high percentage is also registered by artistic and cultural heritage, confirming tourists’ interest in elements of the culture and nature of the host countries supported by Osmanković et al. (2010). Percentages lower than 50% are registered only by criteria like mostly hilly and mountain natural assets and by high percentage of protected areas. The first aspect could be interpreted in a positive way because it is a signal of destinations capable of becoming benchmark despite several obstacles that a hilly or mountain territory can determine (Tardivo et al., 2014); as for the second, despite it is a fundamental indicator of environmental protection - given that the presence of protected areas implies the existence of regulations, norms and limitations affecting tourism development (Bosetti et al., 2006) -, it is not present in more than half of the destinations under inspection.

Table 3 shows how the total of destinations has telephone/mobile in line with other national/European areas and almost the total (97%) owns an intensive internet network. This reflects a current trend that shows a high importance and diffusion of mobile communication (Dabholkar, Thorpe e Rentz, 1996). Poor rates are registered by the level of sanitation that is good only in 61% of destinations due to the difficulty of accessing such services as a consequence of a fragmented territory and of cuts in public spending for this sector (Tardivo et al., 2014).

Source: Adaptation from Tardivo et al. (2014)

Results for clean production (Table 4) can’t be read in a very positive way because they show an optimal level of pollution only in half of the destinations, discrete hygiene and sanitation in 60% of cases (with respect to this, it is important to signal the dramatic situations of services in Andalusia and Stockholm (Tardivo et al., 2014)). Anyway, the most critical datum is registered by recycling waste, low in 44% of destinations, symptom of a not-so-well ingrained awareness of its importance in European destinations, apart for some sporadic cases like Stockholm.

Source: Adaptation from Tardivo et al. (2014)

With reference to “tourism carrying capacity” (Table 5), customer care and image collect the highest frequencies: the first one shows high level in 96% of destinations and confirms the increasing importance of the aspects pertaining to the customer (satisfaction levels, etc.) emphasized by Cernat and Gourdon (2012); the second one, high in 94% of destinations, can even contribute to forming destination brands and these two concepts can influence customers’ loyalty to a destination (Tasci and Kozak, 2006). High percentages are registered also with regard to good food quality: in fact, local food can become an attraction to tourists thereby increasing the circulation of tourist expenditure through the local economy (Hall and Wilson, 2009). Also number of days of the visit ranges from 4 to 7 in 92% of cases, symptom of destinations not affected just by an excursion flow.

Source: Adaptation from Tardivo et al. (2014)

CONCLUSIVE REMARKS

Results of this research provide a descriptive and prescriptive framework of features that a destination pursuing the path of sustainability should develop. However, sustainability seeks some balance between economics and society: in fact, economic activity and strong social structures can promote a healthy environment and, in turn, healthy ecosystems can enrich the lives of the people who live, work and play in those environments (Flint et al., 2002).

This paper shows how, for environmental management, the highest percentages are registered with by “good quality of energy efficiency” (96%) and tourism ecolabelling (100%) while ecotourism/natural assets show very high values for “high nature conservation” (99%) and “increasing tourism development” (96%). For what concerns supporting assets, the best performances are reached by the datum “Telephone/mobile in line with other national/European areas” (100%) and the “intensive internet network” (97%) while “on average waste generated” (83%) is the sub-factor showing the highest frequency with regard to clean production.

Finally, the tourist carrying capacity is prevalently based on “high customer care” (96%) and “good food quality” (92%).

This research proposes several managerial implications: first, the framework could represent a good guideline to be considered by policymaking in the formulation of their strategic plans for particular destinations (Tardivo et al., 2014); second, these characteristics could lead tour operators to create specific tours in sustainable destinations, created with the tourists, suitably sensitized on these aspects. Furthermore, this research can offer guidelines not only for destinations that choose the path of sustainability but also for tourism investors that would help assess the level of sustainability of their investments in some destinations in terms of environmental risk or added value for the local community.

Starting from this basis, important strategies can be drawn like, for example, a campaign of sensitization towards the adoption of recycling waste, low in 44% of cases, or a major emphasis on the creation of protected areas, present in high percentages only in 46.5% of destinations.
Furthermore, given the high importance attributed to customer care and to image, a higher involvement of tourists in the creation of travel offers should be evaluated and particular campaigns focused on the image of uniqueness of a sustainable tourist destination should be developed.

The future diffusion of the culture of sustainability not only in the entrepreneurial field but also in tourism will strongly change the management of destinations. This doesn’t mean that the traditional objective of destination (consisting in the attraction of tourists) will disappear but it will have to coexist (Tardivo et al., 2014). Despite the relevance of this paper both for literature and for managerial purposes, it must be viewed in the light of important limitations: first, it analyzes just frequencies of the different features and doesn’t provide a global index of sustainable benchmark destinations; second, it analyzes just destinations of a limited area (Europe) and in a limited period of time (5 years); third, it considers the criteria used by the organizations that deliver awards as the best way to measure the sustainability of an area without involving experts on this topic in this evaluation. Finally, it doesn’t propose a distinction among the different typologies of destinations, often characterized by peculiarities that should be taken into account.

These suggestions could be very useful in order to develop this paper in the future, enriching it with a quantitative approach able to result in a more complete assessment of the level of sustainability of a tourist destination, maybe integrated with a Delphi methodology including also bodies, tourist operators, tourists and other important stakeholders in the process of measurement. Furthermore, a similar methodology could be applied to every destination awarded at world level up to now: in this way, destinations would have a very exhaustive framework of features to follow in order to become sustainable.

PROMOTING TOURISM TO BOOST EXPORTS: AN EMPIRICAL INVESTIGATION

Teerakapibal, Surat

Department of Marketing, Thammasat Business School, Thammasat University, Thailand

ABSTRACT

This study examines the causal relationship between tourism expansion and exports growth using Thai macroeconomic data. A series of bivariate Vector Autoregressive (VAR) models are estimated. Long-run equilibrium relationship between international tourist arrivals and exports volume is investigated using Johansen rank tests for cointegration, whereas the short-run equilibrium relationship is determined by Granger causality tests. Though results fail to reject that long-run equilibrium relationship between the two factors does not exist, evidence for a bi-directional causality is found. Empirical findings justify the potential of tourism marketing programs on international trade growth. Conversely, exports promotion programs are identified as a means to reinforce tourism industry development.

Keywords: Tourism marketing; Exports expansion; Cointegration; Granger causality

INTRODUCTION

International trade allows for exchanges of capital, goods, and services across national borders and territories. Its economic, social, and political importance has been recognized for millennia. In 2012, international merchandise trades totaled US$17.3 trillion. While top 10 merchandise traders accounted for 51% of world merchandise trade, developing economies capture 42% of the market (World Trade Organization, 2013). Adopting the export-led growth strategy, nations expand their exports in order to speed up their industrialization process. This is based on the belief that the exports growth generates technological spillovers and other externalities to the economy (Balassa, 1978; Feder, 1982; Kormendi & Meguire, 1985; Marin, 1992). Specifically, countries manage to gain hard currency through trade to import commodities manufactured more cheaply internationally to improve productivity (Goldstein & Pevehouse, 2008).

As a result, countries initiate a variety of measures to strengthen their capability to compete in the global market. In January 2010, U.S. President Obama launched the National Export Initiative (NEI) with the goal to renew and revitalize efforts to promote American exports abroad. Programs ranging from improved advocacy, trade promotions, export financing, to trade liberalizing agreements negotiations markedly boost U.S. goods and services exports from US$ 1.58 trillion in 2009 to a record...
high of US$2.20 trillion in 2012 (Department of Commerce, 2013). Interestingly, the South Korean President Lee Myung-Bak took a less direct approach to foster exports of its national goods and services. In 2009, he assembled a Presidential Council on Nation Branding to proactively shape and manage the South Korean image and reputation. Driven by the spread of popularity of South Korean culture, world’s appetite for its national products soars. In particular, South Korean exports increase from US$ 364 billion in 2009 to US$ 560 billion in 2013 (Korea International Trade Association, 2014). Remarkably, Korea Tourism Organization reports that South Korea enjoys an approximately 55.75% increase in number of tourists which corresponds to a 51.77% rise in tourism receipts during the same time period (Korea Tourism Organization, 2014).

Marketing literatures have investigated how national factors influence consumer product evaluation processes. In particular, consumers form positive or negative feelings towards a country based on cultural, political, historical, and economic factors. These perceptions, in turn, influence consumers’ evaluations and purchase intentions of products from that particular nation (Hong & Kang, 2006; Klein et al., 1998; Mahesrawan & Yi, 2006). On the other hand, another stream of researches (such as Roggenbuk et al., 1990; Weiler & Hall, 1992; Chronis, 2005; Mitchell, 1998; Palmer, 2005; Richards, 2002) argues that “travel offers one of the few contemporary opportunities outside of the education industry where explicitly designated, non-vocational learning about other times, places, and people takes places” (Falk, 2012). Moreover, Shan & Wilson (2001) and Kulendran & Wilson (1998) specifically argue that more foreign tourists to a host country generally increase the image of the country for its goods and services (Katircioglu, 2009). Therefore, it is likely that consumers may update their perceptions towards the country while travelling and adjust their preference for that nation’s products. Consequently, the nations which manage to bolster its tourism could experience an upsurge in international demands for its exports.

The objective of this paper is to examine if there exist a cointegration and causal link between tourism growth and exports expansion with the following questions:

1. Does increase in number of tourists translate to exports expansion?
2. Does increase in exports drive tourism growth?
3. Does the causality between tourism and exports growth run in both direction?

Empirical evidence of a relationship between international tourism and exports growth will urge governments to consider foreign visitors not only as a source of income domestically but also as prospective importers. In other words, tourism marketing will emerge as a tool to promote exports. Conversely, governments should acknowledge that exporting merchandise to foreign nations can also act as a nation brand ambassadors. In addition, if the causative process is bi-directional then both
exports and tourism promoting programs must be instituted concurrently for optimal growth of the nation.

The rest of the paper is organized as follows. In the next section, I describe the time series data utilized in the analysis. Methodology which includes unit root tests for stationarity of time series, tests for a long-run relationship, and Granger causality tests are then explained along with empirical results. Finally, I conclude in the last section with discussions and conclusions.

**DATA AND METHODOLOGY**

*Data*

Thai macroeconomic data are used for the analysis as exports is a major economic factor in Thai economy. In 2012, Exports of goods and services accounted for an estimate of 75% of Thai GDP in 2012 (The World Bank, 2014). At the same time, Thailand has been extensively promoting its tourism. “Amazing Thailand” is the slogan for tourism marketing. In 2013, Bangkok, its capital, was identified as the most visited city in the world by the 2013 Global Destination Cities Index, while Suvarnabhumi airport was the world’s most geotagged location on Instagram (Quan, 2013; Abramson, 2013). Statistically, the tourism industry comprised of approximately 6.7% to the country’s GDP in 2007 (Bangkokpost.com, 2008).

This paper employs international tourist arrivals data collected by Immigration Bureau, Thailand, published on the Thai Ministry of Tourism and Sports website. The data contain number of foreign visitors who visit Thailand (*tourists*) during January 2008 to December 2013. Though tourism receipts data are also available, the number of tourist arrivals has been utilized as a reasonable proxy for tourism expansion (Kim *et al.*, 2006; Wang & Godbey, 1994). In order to investigate the relationship between number of tourists and exports, monthly exports (*exports*) data made available by the Bank of Thailand spanning over the same period are also included in my analysis. Both time-series data are shown in Figure 1.

As both variables are of different units, they are transformed using natural logarithmic function to facilitate interpretation of coefficients. In particular, coefficients in log-log models represent elasticities, which measure the resulting percentage change in the dependent variable due to a percentage change in an explanatory variable. $\ln(tourists)$ and $\ln(exports)$ plots can also be found in Figure 1.
Stationarity requires that the mean, the variance, and the autocovariance of a series are not time varying (Engle & Granger, 1987; Enders, 1995). Granger & Newbold (1974) suggest that conventional econometric techniques such as the ordinary least square method will yield biased results when variables of interest are non-stationary or exhibit a unit root. As a result, it is a necessary first step to transform the data to their stationary form prior to analysis. Unit root test is a means through which

**Unit root and cointegration tests**

Stationarity requires that the mean, the variance, and the autocovariance of a series are not time varying (Engle & Granger, 1987; Enders, 1995). Granger & Newbold (1974) suggest that conventional econometric techniques such as the ordinary least square method will yield biased results when variables of interest are non-stationary or exhibit a unit root. As a result, it is a necessary first step to transform the data to their stationary form prior to analysis. Unit root test is a means through which
the order of integration of variables can be identified. In this study, the Dickey-Fuller test is used to test the following hypotheses:

\[ H_0: \alpha = 1 \quad H_a: |\alpha| < 1 \]

where \( \alpha \) is the autoregressive coefficient. In order to test for a unit root, I allow time series to follow 3 distinct types of models:

1. The zero mean model

\[ y_t = \alpha y_{t-1} + \epsilon_t \] (1)

2. The constant mean model

\[ y_t = \mu + \alpha y_{t-1} + \epsilon_t \] (2)

3. The trend model

\[ y_t = \mu + \beta t + \alpha y_{t-1} + \epsilon_t \] (3)

where \( y_t \) is the time series and \( \epsilon_t \) is the white noise error.

The results of testing the order of natural logarithm of tourists and exports are provided in Table 1. The tests suggest that \( \ln(\text{tourists}) \) is non-stationary under the specifications of the zero mean (p-value = 0.6883 and 0.8014) and constant mean (p-value = 0.1311 and 0.3330) models. Interestingly, the null hypothesis of non-stationary when it is tested with the trend model (p-value = 0.002 and 0.004) is rejected. Similarly, the tests support the null hypothesis of non-stationary for \( \ln(\text{exports}) \) when the zero mean (p-value = 0.6842 and 0.7994) and constant mean models (p-value = 0.0963 and 0.1663) are employed. On the other hand, the tests of stationarity yield mixed results when the autoregressive coefficient is estimated using the trend model (p-value = 0.0301 and 0.0911).

Common methodologies in transforming non-stationary time series to their stationary form include first differencing and time-trend regression. Based on the aforementioned results, first differencing is the appropriate trend removal procedure. Table 1 also contain results of the Dickey-Fuller tests of non-stationarity for \( \Delta \ln(\text{tourists}) \) and \( \Delta \ln(\text{exports}) \). Specifically, \( \Delta \ln(\text{tourists}) \) is found to be stationary under all 3 different specifications: zero mean (p-value = 0.0001 and < 0.0001), single mean (p-value = 0.0001 and 0.0001), and trend (p-value = 0.0001 and < 0.0001) models. Likewise, first differenced series of natural logarithm of exports is also found to be stationary across all models: zero mean (p-value = 0.0001 and < 0.0001), single mean (p-value = 0.0001 and 0.0001), and trend (p-value = 0.0001 and < 0.0001). In sum, the variables are \( I(1) \) and the first differenced series should be used for analysis.
As a unit root is present in both time series, it is necessary to test whether they are cointegrated. Though traditional analyses require time series to be stationary, researchers argue that information may be lost if data are differenced (Engle & Granger, 1987; Watson 1994). In brief, the non-stationary time series in \( Y_t \) are cointegrated if there is a linear combination of them that is stationary or \( I(0) \). That is, cointegration means that non-stationary variables are integrated in the same order with the residuals stationary. It is believed that cointegrated time series with a long-run equilibrium relationship cannot drift too far apart from the equilibrium because economic forces will act to restore the equilibrium relationship (Zivot & Wang, 2006). Statistical tools such as the error correction model (ECM) utilize the concept of cointegration to study the link between long-run equilibrium relationship and short-run dynamic adjustment mechanisms.

Results for tests of cointegration are shown in Table 2. Based on the Johansen cointegration rank tests, the null hypothesis of no cointegration is not rejected as the trace statistics (9.77) is less than the critical value (12.21) (Johansen & Juselius, 1990; Johansen, 1988; Johansen, 1995a; Johansen, 1995b). Therefore, results suggest that long-run equilibrium between number of tourists and amount of exports does not exist. Consequently, vector autoregressive models (VAR) will be utilized to analyze the time series.

**Cointegration rank test using trace**
VAR model

I conjecture that there exists a relationship between tourism growth and international trade. In particular, it is believed that these variables are not only contemporaneously correlated to each other, but they are also correlated to each other’s past values. Therefore, models with exogenous variables are not appropriate (Sims, 1980). In this study, the vector autoregressive model (VAR) will be estimated to fit the time series data. VAR allows for an estimation of a short-run dynamic relationship among endogenous variables. As previously discussed, the first differenced series will be used and error correction terms will not be included in the VAR model. The $p$th-order bivariate VAR system is given by:

$$
\begin{bmatrix}
\Delta \ln(\text{tourists})_t \\
\Delta \ln(\text{exports})_t
\end{bmatrix} = \delta + \Phi_1 \begin{bmatrix}
\Delta \ln(\text{tourists})_{t-1} \\
\Delta \ln(\text{exports})_{t-1}
\end{bmatrix} + \cdots + \Phi_p \begin{bmatrix}
\Delta \ln(\text{tourists})_{t-p} \\
\Delta \ln(\text{exports})_{t-p}
\end{bmatrix} + \varepsilon_t
$$

(4)

where $\delta = \begin{bmatrix} \delta_1 \\ \delta_2 \end{bmatrix}$ is a constant vector and $\Phi_l$ is a $2 \times 2$ matrix of parameters. $\varepsilon_t$ is a vector of white noise process with $\varepsilon_t = \begin{bmatrix} \varepsilon_{1t} \\ \varepsilon_{2t} \end{bmatrix}$ such that $E(\varepsilon_t) = 0$, $E(\varepsilon_t \varepsilon_s') = \Sigma$, and $E(\varepsilon_t \varepsilon_s) = 0$ for $t \neq s$.

A series of bivariate VAR systems of different orders are estimated using VARMAX procedure in SAS. In order to determine the optimal number of lags, $p$, to be included in the model, 2 distinct information criteria are calculated: Corrected Akaike Information Criteria (AICC) and Schwartz Bayesian Criteria (SBC).

$$
AICC = \log(\bar{\Sigma}) + \frac{2r}{T-k}
$$

(5)

$$
SBC = \log(\bar{\Sigma}) + \frac{r \log(T)}{T}
$$

(6)

where $r$ denotes the number of parameters estimated, $k$ is the number of dependent variables, $T$ is the number of observation used to estimate the model, and $\bar{\Sigma}$ is the maximum likelihood estimate of $\Sigma$. Table 3 reports criterion values for models with different number of lags. As the optimal number of lags is associated with the model yielding the smallest criterion value, results suggest that 9th-order VAR process best characterizes the time series data of interest.

Model comparison

The Future of Entrepreneurship

Granger causality tests

Enders (1995) proposes that granger causality test is best suited to determine whether the lags of one variable significantly enter into the equation for another variable. This sense of causality is defined by Granger (1969) and Sims (1972). This methodology is employed in this paper to determine not only the relationship between tourism and exports growth but rather their causality. Though a conventional F-test may be utilized to test the restriction that all lags of the variable do not enter significantly into VAR model specification, this paper employs Wald statistic instead. Consider (4) in the following form:

\[
\begin{bmatrix}
\Phi_{11}(B) & \Phi_{12}(B) \\
\Phi_{21}(B) & \Phi_{22}(B)
\end{bmatrix}
\begin{bmatrix}
\Delta \ln(tourists)_t \\
\Delta \ln(exports)_t
\end{bmatrix}
= 
\begin{bmatrix}
\delta_1 \\
\delta_2
\end{bmatrix}
+ 
\begin{bmatrix}
\epsilon_{1t} \\
\epsilon_{2t}
\end{bmatrix}
\tag{7}
\]

, where \( \Phi_{ij}(B) \) are vectors of coefficients.

According to (7), the variable \( \Delta \ln(tourists)_t \) causes \( \Delta \ln(exports)_t \) if \( \Phi_{21}(B) \) is not statistically different from zero. On the other hand, \( \Phi_{12}(B) = 0 \) would infer that \( \Delta \ln(exports)_t \) does not cause \( \Delta \ln(tourists)_t \). The implication of this model structure is that future values of the process \( \Delta \ln(tourists)_t \) can either be influenced by its own past value and by the past value of \( \Delta \ln(exports)_t \) or both, and vice versa. For the case where the future \( \Delta \ln(tourists)_t \) are not affected by the past values of \( \Delta \ln(exports)_t \), it would be more appropriate to model \( \Delta \ln(exports)_t \) separately from \( \Delta \ln(tourists)_t \). That is, the VAR model is unnecessary.

The CAUSAL statement under VARMAX procedure in SAS is employed to conduct Granger causality tests. Specifically, Wald statistic is calculated for the 2 following sets of hypotheses:

\[ H_0: \ \Phi_{12}(B) = 0 \quad H_0: \ \Phi_{12}(B) \neq 0 \]

and

\[ H_0: \ \Phi_{21}(B) = 0 \quad H_0: \ \Phi_{21}(B) \neq 0 \]

As suggested by Pindyck & Rubinfeld (1991) and Shan & Sun (1998), tests are performed for different lag selections to examine robustness of results. Table 4 provides chi-square and corresponding p-value for Granger causality tests. The null hypothesis that exports growth do not ‘Granger cause’ increased number of tourists is rejected across practically all models except for 1st-order VAR (p-value < 0.0001 for model with the optimal number of lags). Consistency in results suggest the export-led tourism growth hypothesis. Interestingly, tourism growth also induces greater export volumes as results allows for rejection of the null hypothesis that tourism growth does not ‘Granger cause’ exports expansion (p-value < 0.0001 for model with the optimal number of lags). Though absence of cointegration refutes the existence of a long-term relationship, short-run reciprocal feedback is evident between the two series.
DISCUSSIONS AND CONCLUSIONS

Using Thai macroeconomic data, this study empirically tests for both short-run and long-run equilibrium relationships along with the direction of causality between exports growth and international tourist arrivals expansion. Johansen rank tests for cointegration show that a long-run equilibrium relationship does not exist between the two time series. However, results do not entirely discourage tourism marketing as a means to boost exports. Results from Granger causality tests applied to a series of VAR model confirm short-run equilibrium relationship. In particular, I find that tourism growth 'Granger cause' an increase in international trade. Similarly, exports expansion...
'Granger cause' a surge in number of tourist arrivals. Together, the bi-directional causality suggests that stimulating both factors can tremendously enhance the nation’s productivity output. Results from this study provide several future research directions. For instance, the VAR models could be expanded to include other factors such as the GDP of tourists' home country, exchange rates, and a measure for the distance between Thailand and tourists' country of residence. Furthermore, it may be worthwhile to determine if tourism marketing is effective in raising exports for all countries alike. Such results could lead to better understanding of the root cause for the relationship between exports and tourism growths.

In sum, this paper suggests that governments should implement tourist-attracting policies as a means of economic development as it does not only support the tourism industry but also expand exports volumes. Conversely, programs supporting merchandise exports must be adequately sponsored by governments as they produce externalities to the tourism sector.

The Future of Entrepreneurship

THE CONTRIBUTION OF FRENCH LITTERATURE AUTHORS TO THE FRENCH LAW AND POLICY ON TECHNICAL WORKS

Theodoropoulou, Konstantina; Katsakiori, Panagiota

Hellenic Open University, Greece.

ABSTRACT

Public management depicts the dominant political tendencies in each country and is influenced by globalized Europe’s policies. The new public management is the current innovation of the capitalistic system in public administration which pushes the state away from the traditional bureaucratic model of organizing public services towards managerialism: a management based on market rules. Can this tool be used efficiently in all public spheres? Can we, for example, protect our monuments through Public-Private Partnerships and produce a new generation of laws on avant-garde agriculture methods and products, exemplified by Biological Agriculture?

Since the age of Enlightenment, society went through a deep reform using reason and scientific method to challenge ideas grounded in tradition and faith. Great men, writers, politicians and architects, such as Victor Hugo, Antoine-Chrysostome Quatremére de Quincy, Prosper Mérimée, Eugène Viollet-le-Duc, André Malraux, Le Corbusier, Antoine de Saint-Exupéry, the pioneer of science-fiction genre Jules Vernes etc. inspired people through their life and work and contributed to the gradual development of our perception for humanity, science, conservation, legislation and policies. For instance, the great novelist Malraux, as Culture Minister, proposed the so-called “Malraux law”, in 1962, on the “safe-guarded” domains and thus he achieved to prevent entire neighborhoods, in Paris and other french cities, from demolition. The intention of this essay is to perceive critically the way the state manages heritage and examine the possibilities of management in the area of new scientific discoveries.

Keywords: Public - Private Partnership (PPP), French legislation, Monuments, Discoveries, New Public Management (NPM), Culture

INTRODUCTION

Philosophy, art and politics have contributed to the evolution of French technical legislation especially in the fields of heritage law and innovative technologies, such as aeronautics, nuclear power, renewable energy, etc. Indeed, French writers, politicians and architects, such as Victor Hugo,
Antoine-Chrysostome Quatremère de Quincy, Prosper Mérimée, Eugène Viollet-le-Duc, André Malraux, Antoine de Saint-Exupéry, the pioneer of science-fiction genre Jules Vernes etc. influenced through their work, as writers or civil servants of the State, the establishment of technical legislation adopted today at international level.

RESTORATION IN FRANCE

In France, the cradle of Enlightenment, since the 18th century, the importance and didactic value of the remainings of the past have been clearly realized. During the Revolution, the Crown and Church property became national and the term "Historic monument" emerged. The new term in fact meant "National monument": the estate of French people, which should be protected as part of nation’s identity, and be preserved for future generations. The destruction of monuments during the period 1729-1794, led to reactions: the disasters were branded as vandalisms, the first public museums were created (Louvre, museum of monuments of France) and simultaneously began the first attempts of recording and indexing nationwide the monumental national wealth.

In 1793, the "Provisional Committee for the Arts" expedited a National Assembly, with instructions for indexing and maintaining the objects that could be beneficial for the arts, science and education. Indexing along with the characterization of monuments (classification) are two innovative, internationally, protective measures which will contribute decisively over the years to enrich, deepen and widen the concept and purpose of monumental protection. In the first three decades of the 19th century, remnants of medieval past in France, such as gothic cathedral churches and castles (chateaux), emerged as the most important French monuments, main expression and contribution of French culture in the European cultural scene.

Although the concept of "Historic Monuments" existed since the Revolutionary period, many ancient buildings, especially religious ones, once made national property, were dismantled or destroyed. It wasn’t until the spread of the Romantic Movement a generation later (with the publication of Le Génie du Christianisme, by Chateaubriand in 1802, and Notre-Dame de Paris by Victor Hugo in 1831), that institutions began to become aware of the necessity of preservation. Since 1819, the state budget contained a provision for historic monuments and in 1830, the Interior Minister, François Guizot, created the post of Inspector of Historic Monuments, a key-position for protection, and Ludovic Vitet was named the first Inspector of Historic Monuments, succeeded in 1834 by Prosper Mérimée.

The first list of Monuments of National Importance was published in 1840. It was only much later, in 1893, that the function of Head Architect of Historic Monuments was created. In 1913, a law specified the framework and criteria for monument protection. After World War I, this protection began to
include private property, edifices and artworks from the modern (1453-1789) and contemporary (after 1789) epochs.

The restoration doctrine was formalised in 1931, by the Athens Charter, which advocated an "enlightened criticism" in interventions, and urged each country to address the concerns relative to the conservation of historic sites within the framework of national legislation. The principle of restoration was the preservation of existing edifices. However, good intentions were often hindered by the limited knowledge concerning the objects to be restored, as art history was only just emerging as a scientific discipline in the nineteenth century. (http://www.reims-cathedral.culture.fr/restoration-in-france.html)

CONTRIBUTION OF FRENCH AUTHORS TO HERITAGE PROTECTION

Antoine Quatremère de Quincy (1755-1849) was leader of the French Academy under Napoleon, theorist and historian of 18th century French art and artistic biographer. Quatremère initially studied law before taking courses in art and history at the Collège de Louis-le-Grand. He also trained as a sculptor. After visiting Naples and later Rome, he became interested in Classical Greek sculpture and architecture. He wrote several essays on architectural theories, winning a competition sponsored by the Académie des Inscriptions et Belles-Lettres in 1785. Based on his belief that style and function were inseparable in architecture, Quatremère orchestrated the renovation of the Parisian church of St. Genevieve into the Panthéon, France’s national mausoleum. He also advocated the use of the Neo-Classical style in other buildings.

The events of French Revolution caused him to become an advocate for artistic freedom and copyright. He was elected a deputy to the Legislative Assembly in 1791, but during the Reign of Terror imprisoned for two years, and nearly executed twice (1793 and1795). After being exiled to Germany in 1797, Quatremère began reading the works of Immanuel Kant (1724-1804), and Gotthold Lessing, subsequently incorporating their philosophical ideas into his own theories on aesthetics. As a member of the Council of the 500 in 1797, he served both there and later as a member of the Académie des Inscriptions et Belles Lettres in 1804.

In 1815, as the Intendant Général des Arts et Monuments Publics, he published a critical evaluation of French museum practices aimed at the practices of the museum builder Alexandre Lenoir, entitled “Considérations Morales”. While serving as the Secrétaire Perpétuel to the Académie des Beaux-Arts from 1816-1839, Quatremère gave funeral orations of Académie members. His important essay on the fine arts, “Essai sur la nature, le but et les moyens de l’imitation dans les beaux-arts”, was published in 1823 and translated into English by 1837. Quatremère was instrumental in assisting the career of Guillaume-Abel Blouet by convincing the Académie Royale d’Architecture to publish Blouet’s
important report on monuments restoration, Restauration des thermes d’Antonin Caracalla à Rome in 1828. He also published biographies of several Italian artists, including Antonio Canova (1823), Raphael (1824), and Michelangelo (1835).

Quatremère’s theories epitomized the Academy’s stance of the Greco-Roman style as the only appropriate building type for architects. This would be challenged in succeeding generations by architectural historians such as Jean-Baptiste Lassus and Eugène Viollet-le-Duc. Quatremère was the last “armchair” archaeologist, eschewing the excavation site for personal and sometimes romantic interpretations of art. However, Quatremère strongly argued for keeping works of art in situ and against Napoleon’s conglomerate museum. He successfully put forward the idea that the true heritage of Rome was the Roman sky, the topography of its hills, the mentality of its inhabitants, the music of its language, its monuments and once exiled to the banks of the Seine or elsewhere, they would have lost their true value. (Poulot, 2011)

**Victor Hugo (1802-1885)** was a French novelist, poet and dramatist, the most important and prominent representative of the Romantic movement. He is considered one of the greatest and best known French writers. His best-known works are the novels “Les Misérables” (1862) and “Notre-Dame de Paris” (1831) also known in English as “The Hunchback of Notre-Dame”. In France, Hugo’s literary fame comes first from his poetry but also rests upon his novels and his dramatic achievements. Though a committed royalist when he was young, Hugo’s views changed as the decades passed, and he became a passionate democrat. His work touches upon most of the political and social issues and artistic trends of his time. ([http://en.wikipedia.org](http://en.wikipedia.org))

His interest for the french medieval monuments is depicted in his romantic/gothic novel “The Hunchback of Notre Dame” that was published in 1831 and quickly translated into other languages across Europe. The title refers to the Notre Dame Cathedral in Paris, on which the story is centered. Victor Hugo began writing the novel in 1829, largely to make his contemporaries more aware of the value of Gothic architecture, which was neglected and often destroyed to be replaced by new buildings, or defaced by replacement of parts of buildings in a newer style. For instance, the medieval stained glass panels of Notre-Dame de Paris had been replaced by white glass to let more light into the church. This explains the large descriptive sections of the book, which far exceed the requirements of the story. A few years earlier, Hugo had already published a paper entitled Guerre aux Démolisseurs (War to the Demolishers) specifically aimed at saving Paris’ medieval architecture.

The case (ypothesis) of this epic drama presents the heroine, gypsy Esmeralda, dancing in the courtyard of the church “Notre Dame” where she attracts the attention of archdeacon Claudius Froll who desires to conquer her and tries to kidnap her with the help of Quasimodo the bell-ringer, a very ugly but vigorous man. Esmeralda manages to avoid abduction thanks to the intervention of a group
of soldiers under the officer Phoebus de Satoper, whom she meets after a few days. Phoebus falls in love with Esmeralda and later the jealous Archdeacon kills him and lets Esmeralda be accused of murder. Esmeralda prefers death rather than surrender to the appetites of the priest who suggests to free her with terms. Esmeralda is led to the gate of the temple for execution where Quasimodo intervenes, out of love, and saves her by bringing her inside the Temple. After many adventures, Esmeralda is eventually arrested and executed. Quasimodo kills the Archdeacon by pushing him of the spire from where they were watching Esmalda’s execution. At the end, Quasimodo dies at the cemetery next to Esmeralda’s body where he was found hugging her dead body.

The popular novel-masterpiece had a great impact on the audience and attracted thousands of tourists in Paris who wanted to visit the Cathedral of Notre Dame. It also inspired a renewed appreciation for pre-Renaissance buildings, which thereafter began to be actively preserved. Indeed, the City of Paris soon after the publication of the book acted for the restoration of the much-neglected Cathedral of Notre Dame. The first archaeological companies were already established in France since 1820 and they were focusing in the study of medieval art, while in 1832, Hugo published a new pamphlet about the values of a building: "There are two things in an edifice: its use and its beauty. Its use belongs to its owner, its beauty to everyone. Thus, the owner exceeds his rights in destroying it." The idea of cultural heritage protection clearly derives from this text.

In 1841, after three unsuccessful attempts, Hugo was finally elected to the “Académie française”, solidifying his position in the world of French arts and letters. Thereafter he became increasingly involved in French politics. He was elevated to the peerage by King Louis-Philippe in 1841 and entered the Higher Chamber as a pair de France, where he spoke against the death penalty and social injustice, and in favour of freedom of the press and self-government for Poland. However, he was also becoming more supportive of the democratic form of government and, following the 1848 Revolution and the formation of the Second Republic, was elected to the Constitutional Assembly and the Legislative Assembly.

When Louis Napoleon III seized complete power in 1851, establishing an anti-parliamentary constitution (Coup d’état), Hugo openly declared him a traitor to France and lived in self-exile until 1870. While in exile, Hugo published his famous political pamphlets against Napoleon III, Napoléon le Petit and Histoire d’un crime and in 1859, he refused a granted amnesty by Napoleon III, as it meant he would have to curtail his criticisms of the government. It was only after Napoleon III fell from power and the Third Republic was proclaimed that Hugo finally returned to his homeland, where he was promptly elected to the National Assembly and the Senate. Victor Hugo not only was a great writer but also a great politician who believed in human rights and freedom. He was buried into the Panthéon.
Because of his concern for the rights of artists and copyright, he was a founding member of the “Association Littéraire et Artistique Internationale”, which led to the Berne Convention for the Protection of Literary and Artistic Works. However, in Pauvert’s published archives, he states strongly that "any work of art has two authors: the people who confusingly feel something, a creator who translates these feelings, and the people again who consecrate his vision of that feeling. When one of the authors dies, the rights should totally be granted back to the other, the people". (http://en.wikipedia.org)

In 1834, the role of Inspector General of Historical Monuments was appointed to Prosper Mérimée (1803-1870): french dramatist, historian, archaeologist, and short story writer with studies on law as well as in Greek, Spanish, English, and Russian. Mérimée, through his institutional role, contributed to the protection of cultural heritage, as he was responsible to identify sites for conservation and give a scientific opinion for the purpose of conservation and restoration and the necessity for future projects on monuments of the State. He was a born archaeologist, combining linguistic faculty of a very unusual kind with accurate scholarship, with remarkable historical appreciation, and with a sincere love for the arts of design and construction. In 1837, the Committee of Historical Monuments was established of volunteers to assist Mérimée in his work. Due to his untiring action the Office of Historical Monuments (Service des Monuments Historiques) was also created, while parallely he formed the theoretical basis for the development of the doctrine for the total stylistic restoration of monuments.

Today, in France - in honor to Prosper Mérimée - exists “The Base Mérimée”, which is the French database of monuments listed as having national significance in history, architecture or art. It was created in 1978, and placed online in 1995, by the French Ministry of Culture, division of architectural heritage. The database is periodically updated and contains information derived from the first survey of historic monuments made by Mérimée in 1840 and cultural heritage inventory, specifically: religious, domestic, agricultural, educational, military and industrial architecture. The 1840’s first official list of Monuments of National Importance included 1,034 edifices, mostly medieval, and all of which were public property.

Important works of Mérimée are the restoration of Cluny (baths in Paris), and the discovery of a textile project "The Lady and the Unicorn" which is often considered one of the greatest works of art of the Middle Ages in Europe. The Lady and the Unicorn (La Dame à la licorne) is the modern title given to a series of six tapestries woven in Flanders of wool and silk, from designs drawn in Paris around 1500. The tapestries were rediscovered in 1841 by Prosper Mérimée in Boussac castle where they had been suffering damage from their storage conditions and are on display in the National Medieval Art Museum (Musée national du Moyen-Âge or Musée de Cluny) in Paris since 1882. The Museum is housed
in the gothic-style Hôtel de Cluny, a 15th century mansion which was built atop the foundations of Roman thermal baths.

Mérimée’s contribution to the salvation of monuments is major. He understood the importance of both mobile monuments (objets mobiliers) and historical buildings (des immeubles). This distinction will later be depicted in the law of 31 december 1913 for the historical monuments. He also considered the display of antiquities such as “The Lady and the Unicorn” in a monument - museum such as “Les Thermes de Cluny” and the “Hôtel de Cluny”. So, not only we meet the use of a monumental complex (hotel and baths) as a museum but also the exhibition of mobile antiquities into historical buildings. The act of converting monuments from “dead and scattered” historical facts into living “forms” was central to Romantic cultural theory and art history. It is a kind of archeology, the archeology of revivification. (Haley, p.19)

**Eugène Viollet-le-Duc** (1814-1879) was a French architect and theorist, famous for his interpretive "restorations" of medieval buildings. Born in Paris, he was a major Gothic Revival architect. Viollet-le-Duc was rebellious and anticlerical. He refused to enter the “École des Beaux-Arts” and obtained practical experience in several architectural offices. In 1835, he returned from study in Italy.

In 1849, Mérimée inspector general of a committee responsible for the awarding of restoration projects of historical monuments (Historique general des Monuments) commissioned Viollet-le-Duc the restoration of Romanesque abbey of Vézelay, where he proceeded on a stylistic restoration and replaced the pointed vaults of the 13th century with semicircular vaults, characteristics of the 12th century, to achieve a sense of unity in the church, but also to highlight the changes of character at the building.

This work was the first of a long series of restorations. Viollet-le-Duc’s restorations at Notre Dame brought him national attention, since the value of the cathedral, as a national monument, was already understood through Victor Hugo's novel.

Viollet-le-Duc's "restorations" frequently combined historical fact with creative modification. For example, under his supervision, Notre Dame was not only cleaned and restored but also "updated", gaining its distinctive third tower in addition to other smaller changes. Viollet-le-Duc wrote that restoration is a "means to reestablish [a building] to a finished state, which may in fact never have actually existed at any given time". The type of restoration employed by Viollet-le-Duc, was decried by John Ruskin as "a destruction out of which no remnants can be gathered: a destruction accompanied with false description of the thing destroyed". This argument is still a current one when restoration is being considered for a building or landscape. In removing layers of history from a building, information and age value are also removed which can never be recreated. However, adding features to a building, as Viollet-le-Duc also did, can be more appealing to modern viewers. However, modern conservation
practice considers Viollet-le-Duc’s restorations too free, too personal, too interpretive, but some of the monuments he restored might have been lost otherwise. Viollet-le-Duc is considered by many to be the first theorist of modern architecture. Sir John Summer wrote that "there have been two supremely eminent theorists in the history of European architecture - Leon Battista Alberti and Eugène Viollet-le-Duc. His architectural theory was largely based on finding the ideal forms for specific materials, and using these forms to create buildings. His writings centered on the idea that materials should be used 'honestly'. He believed that the outward appearance of a building should reflect the rational construction of the building. His theories of rational architectural design link the revivalism of the Romantic period to the 20th-century Functionalism. (http://en.wikipedia.org)

André Malraux (1901 - 1976) was a French surrealist novelist, art theorist, resistance leader, 2nd world war hero and was appointed by President Charles de Gaulle as Minister of Information (1945–1946) and subsequently as France's first Minister of Cultural Affairs during de Gaulle's presidency (1959–1969).

He was arrested at the tender age of 21 for attempting to steal bas-reliefs from a Khmer temple in Cambodia, a precocious act that presaged a lifelong obsession with art, and art collecting, in all its forms. On his return to France, Malraux launched two fine-press series, la Sphère and Aux Aldes and published The Temptation of the West (1926). The work was in the form of an exchange of letters between a Westerner and an Asian, comparing aspects of the two cultures. This was followed by his first novel The Conquers (1928), and then by The Royal Way (1930) which reflected some of his Cambodian experiences. In 1933, Malraux published Man’s Fate (La Condition Humaine), a novel about the 1927 failed Communist rebellion in Shanghai, which was awarded the 1933 Prix Goncourt. His first book on art, Oeuvres gothico-bouddhiques du Pamir, on his experience with southeast Asian art appeared in 1930 and after his father death, he participated on excavations in Iran and Afghanistan.

During the 1930s, Malraux was active in the anti-fascist Popular Front in France. At the beginning of the Spanish Civil War he joined the Republican forces in Spain as a volunteer, serving in and helping to organize the small Spanish Republican Air Force. After the war, Malraux was awarded the Médaille de la Résistance and the Croix de guerre. The British awarded him the Distinguished Service Order. Shortly after the war, General Charles de Gaulle appointed Malraux as his Minister for Information (1945–1946) and soon after that, in 1947 his art-historical career began in earnest. He issued, the first volume, Le Musée Imaginaire, of his most-important art series, La Psychologie de l’art, a work he had been formulating since 1935. The second volume, La Creation artistique appeared in 1948 and volume three, La monnaie de l’absolu, was published in 1949. In 1951, Malraux expanded and reissued La
Psychologie de l’art as the The Voices of Silence (Les Voix du Silence), the first part of which has been published separately as The Museum without Walls. In 1952, A two-volume picture book, Le musée imaginaire de la sculpture mondiale was published, followed, in 1957, by a philosophical narrative on art, La métamorphose des dieux.

When de Gaulle returned to the French presidency in 1958, Malraux became France’s first Minister of Cultural Affairs, a post he held for 11 years. Among many initiatives, he launched an innovative program to clean the blackened facades of notable French buildings, revealing the natural stone underneath. He also created a number of cultural centers (art museums, libraries), known as Maisons de la Culture, in provincial cities, and worked to preserve France’s national heritage. He also oversaw the restoration of the Louvre Museum colonnade to its original state (http://en.wikipedia.org).

Malraux’s legacy as an art theorist is uneven. His art books emphasized ideas rather than original scholarship. His project, the “Imaginary Museum” or his “museum without walls,” as he described it, is an archive that he began in 1947, a montage of photographs of art from all around the globe and throughout history, stretching from Roman sculptures to Impressionist painting. Given that the breadth and diversity of today’s world of art far surpasses the capacities of any single art museum, or even two or three, and that many of the objects are in any case not moveable, the musée imaginaire is an imaginary collection of all the works, both inside and outside art museums, that we today regard as important works of art. Malraux’s idea to use photographs of art objects from different cultures in his books, opened a whole different world to the European reader and art lover. Through art books the public is introduced to the culture and creations of different civilisations that in other cases would have to travel thousands of miles to meet. He also suggested that art is universal. (http://www.dictionaryofarthistorians.org)

In 1996, in recognition of his contributions to French culture, his ashes were moved to the Panthéon, on the twentieth anniversary of his passing.

PUBLIC MUSEUMS IN FRANCE

During the 19th century, the creation of public museums was an innovative intervention of the state in the economy and constituted a public policy for the protection of monuments. Public museums were based on the old regime’s confiscated royal collections (antiquities, paintings, etc) which were exhibited in palatial monuments, such as The Louvre and Versailles. Between 1895 and 2004, France’s national museums constituted a solidary community of institutions directly depending on the Ministry of Culture through the RMN (Réunion des Musées Nationaux), reflecting the concept of the unity of the nation’s collections.

The most important reforms touching on the status of national museums over the last two decades were devoted to the development of a new system of museum management and financing. National museums have progressively been detached from the centralising management of the RMN which was thought to be too restrictive and incapable of providing the dynamic approach needed to react to the development of a fast changing cultural economy. The first major transformations took place in the 1990s when the Louvre (1992) and Versailles (1995) were given the status of autonomous state
establishments, allowing them to manage their own budgets and profits directly and to increasingly turn to private funding in order to complete their budgets for acquisitions, and to expand their activities.

Autonomous in terms of their budget, the museums can use the profits that they generate and reinject them directly back into their own projects. However, they retain their status as public establishments: their staff remain state employees and they are administered according to the public law regime. Generally speaking, new financing policies, although providing continued support from the central government, have placed requirements on museums to seek out additional and novel methods of financing through commercial strategies (the development of museum shops as a rule dates back to the 1980s) and patronage and more generally by developing the range of services that they offer, styling themselves as cultural operators. It is this new politique “de l’offre” that perhaps best sums up the spirit of development at work over the last decade.

(http://liu.diva-portal.org/smash/get/diva2:557284/FULLTEXT01.pdf)

CULTURAL PPPS IN FRANCE

A public–private partnership (PPP) is a government service or private business venture which is funded and operated through a partnership of government and one or more private sector companies. PPP involves a contract between a public sector authority and a private party, in which the private party provides a public service or project and assumes substantial financial, technical and operational risk in the project. In some types of PPP, the cost of using the service is borne exclusively by the users of the service and not by the taxpayer.

Typically, a private sector consortium forms a special company called a “special purpose vehicle” (SPV) to develop, build, maintain and operate the asset for the contracted period. In cases where the government has invested in the project, it is typically (but not always) allotted an equity share in the SPV. The consortium is usually made up of a building contractor, a maintenance company and bank lender(s). It is the SPV that signs the contract with the government and with subcontractors to build the facility and then maintain it. In the infrastructure sector, complex arrangements and contracts that guarantee and secure the cash flows make PPP projects prime candidates for project financing.

(http://en.wikipedia.org)

In the cultural context, the use of PPP contracts by the French Administration remains restricted. However, successful examples of cultural PPPs in France are: a. the Theatre of Archipelago in Perpignan that hosts a cross-border festival, shows and co-productions and has been in operation since October 2011, b. The Marine Museum in Biarritz, a thermal-balance building that requires no heating in the winter or air conditioning in the summer, for a scientific approach to oceanography.
through experiments and c. the National Museum of Civilisations of Europe and of the Mediterranean in Marseille: an ancient fortress which was closed for centuries is now connected with the main museum through a long bridge, offering to visitors a “museum-walk”. This intervention indicates the approach to the legal principle of sustainability for the historical monuments and underlines the importance of heritage for local communities. (Evangelatou et al., 2013). On the other hand, failed case of cultural PPP is the project for the enhancement of the computers system in the Palace of Versailles. The failure was due not to mere incapacity of the private partner but to various reasons and the French museum managed to resume its normal operation soon, without making use to the contracting out, again (Vassilakou and Maniatis, 2012).

HERITAGE MANAGEMENT

Cultural heritage management (CHM) is the vocation and practice of managing cultural heritage/resources. It is a branch of cultural resources management (CRM), although it also draws on the practices of cultural conservation, restoration, museology, archaeology, history and architecture. CHM involves the identification, interpretation, maintenance, and preservation of significant cultural sites and physical heritage assets, along with intangible aspects of heritage, such as traditional skills, cultures and languages. It is especially active, in emergency cases of in danger monuments, where the focus is often upon rescue or salvage archaeology.

CHM has its roots in the rescue archaeology and urban archaeology undertaken throughout Europe after World War II and the succeeding decades. Salvage projects were hasty attempts to identify and rescue archaeological remains before they were destroyed to make room for large public-works projects or other construction. In the early days of salvage archaeology, it was nearly unheard-of for a project to be delayed because of the presence of even the most fascinating cultural sites, so it behooved the salvage archaeologists to work as fast as possible. Although many sites were lost, much data was saved for posterity through these salvage efforts.

In more recent decades, legislation has been passed that emphasizes the identification and protection of cultural sites, especially those on public lands. The public face of CHM, and a significant source of income to support continued management of heritage, is the interpretation and presentation to the public, where it is an important aspect of tourism. Communicating with government and the public is therefore a key competence. (http://en.wikipedia.org)

CONCLUSION

During the last three centuries, in Europe, there have been many radical changes in many aspects of public life: politics, ideology, economics, society, culture, science, technology. From the foundation of
public museums and the creation of terms such as national monument and restoration to public administration and heritage management, many steps have been made for the amelioration of the legislation, policies and management. Gradually there has been a turn from the public to the semi-public and collaborations between private and public parties are favored, even through public–private partnerships. Successful paradigms of cultural ppps show that it is a tool that can be used for cultural projects. It hasn’t yet applied in restoration technical works, however if applied correctly, it should provide a wonderful outcome.

THE COMPETITIVENESS OF THE URUGUAYAN RURAL TOURISM SECTOR AND ITS POTENTIAL TO ATTRACT GERMAN TOURISTS

G. Topolansky Barbe, Federico¹; M. Gonzalez Triay, Magdalena²; Häufele, Cornelia¹

¹School of Business, The Royal Agricultural University, United Kingdom, ²School of Business, University of Gloucestershire, United Kingdom,

ABSTRACT

The main purpose of this article is to assess the competitiveness of Uruguayan rural tourism sector against its main competitors from Argentina and Brazil, as perceived by Uruguayan stakeholders on the supply side. The article will also evaluate the potential of Uruguay as a rural tourism destination in attracting German tourists. Two different questionnaires were administered, one to Uruguayan rural tourism stakeholders and another one to potential German tourists in Germany. The findings indicate that the main strengths of Uruguayan rural tourism offer, compared to Argentina and Brazil, are the hospitality and friendliness of local people; the natural and cultural attractions; and the country’s security and safety. Main weaknesses identified were the poor management of several destination components that are key to create a successful tourism destination and poor management of the ‘demand conditions’ component of Dwyer and Kim’s (2003) integrated model.

Keywords: Competitiveness, Rural tourism, Dwyer and Kim’s (2003) framework, German tourists, Uruguay

INTRODUCTION

Uruguay has a population of 3.3 million habitants and receives around two million tourists each year (Gallardo, 2010).

Tourism is a relatively new industry that has grown rapidly becoming one of the world’s largest providers of employment (World Travel and Tourism Council, 2011). The fact that tourism products can only be consumed “in situ”, means that the revenue generated by the tourism sector is kept within the tourist receiving destination (Ferreira and Estevão, 2009). However, many tourist destinations lose revenue to other countries’ economies and therefore the “leakage effect” must also be taken into consideration (Mill, 2002). Tourism - if conducted in a sustainable way - can provide an alternative for local or national development by improving income levels, employment and tax revenues in the
tourist receiving country (Barbosa et al., 2010). All these benefits make rural tourism an attractive option to develop rural areas in Uruguay.

Whereas in many other countries rural tourism is one of the leading touristic activities, in Uruguay its importance has been neglected for a long time. Rural tourism in Uruguay was initially originated as a business initiative from a group of Uruguayan farmers with entrepreneurial skills looking for additional sources of income (Bentancur, 2008). However, it took a lot of time, for the government to realize the potential of rural tourism (Brida et al., 2008). Alternative forms of tourism are less influenced by the seasonality and would reduce the strong dependency that Uruguayan tourism has on summer tourists that opt for a beach holiday along the south-east coast of the country. A successful marketing strategy pursued by the Uruguayan government has been to develop a country’s brand, under the name of ‘Uruguay Natural’, to promote the country’s image abroad as an idyllic tourism destination with plenty of natural and ‘unspoilt’ surroundings.

Objectives

In light of the rapid development of rural tourism during the past few years, and the Government efforts to promote and enhance the rural tourism offer in Uruguay, it becomes imperative to assess the competitiveness of the Uruguayan rural tourism sector. However, there is very limited research done on the competitiveness of Uruguay as a rural tourist destination in attracting foreign tourists (Mackinnon et al., 2009). The objective of this study is to partially fill this gap by assessing how competitive Uruguayan rural tourism is and evaluating if Uruguay represents an attractive market for German tourists looking for agro tourism. The German market was chosen because it is one of the top tourist generating countries and one of the biggest spenders in international tourism (The World Tourism organization, 2010). Moreover, most tourists - from outside South America - selecting Uruguay as a tourist destination come from Germany, USA and Australia (Mintur, 2011).

COMPETITIVENESS

There are several definitions of competitiveness in the tourism literature (Wilde and Cox, 2008). Scott and Lodge’s (1985, p.3) definition of competitiveness refers to ‘a country’s ability to create, produce, distribute, and service products in international trade while earning rising returns on its resources’. Other scholars such as Newall (1992) believe that national prosperity can only be achieved by increasing the quality and quantity of goods and services that are successfully marketed to international and domestic consumers. According to Barbosa and colleagues (2010) competitiveness is the ability to survive and achieve profitable growth in competing or new markets. Other researchers refer to competitiveness as an opportunity to develop more sustainable communities (Ferreira and Estevão, 2009).
To assess the competitiveness of a tourist destination it is important to consider the principles of comparative and competitive advantage and how they interact with each other (Wilde & Cox, 2008). Natural endowments may form a source of comparative advantage; however, the way that organizations add value to these resources will give some organizations a competitive advantage over competing tourists’ destinations (Crouch and Ritchie, 1999).

Competitive advantage is concerned with the most effective use of the available resources to provide consumers with more value than competitors (Barbosa et al., 2010). Competitive advantage can be achieved either by differentiation or by offering a similar perceived tourist product than competitors at a lower cost (Jobber, 2006). Dwyer and Kim (2003) conclude from a review of existing literature that competitiveness is associated with three major groups of thoughts: the comparative advantage and/or price competitiveness perspective; the strategy and management perspective and the historical and socio-cultural perspective.

There are also several frameworks developed with the purpose of looking at destination competitiveness from the tourism industry perspective (Ferreira and Estevão, 2009). Some of the most relevant ones are briefly discussed below.

As a response to the continuous development of different types of tourism and changes in tourism demand, Crouch and Ritchie (1999) developed a ‘Conceptual Model of Destination Competitiveness’ to analyse the competitiveness of tourism destinations. The model is based on the theories of comparative advantage (Smith, 1776; Ricardo, 1817) as well as on two of the most popular strategic models ‘Porter’s Five Forces’ and ‘Porter’s Diamond’ (Valdez et al., 2010). It focuses on long-term economic prosperity and incorporates economic, ecologic, social, cultural and political aspects of the destination country (Ritchie and Crouch, 2003). Crouch and Ritchie’s model is considered one of the most appropriate frameworks to understand the interplay and relationship between the various factors influencing the tourism competitiveness (Armenski et al., 2007).

Dwyer and Kim (2003) and Dwyer et al., (2004) also developed a holistic model to help identifying the underlying variables of a country’s tourism competitiveness. Dwyer and Kim’s (2003) ‘Integrated Model’- as shown in Figure 1 - aims to improve Crouch and Ritchie’s (1999) model by developing a framework that reflects a more realistic relationship between the major elements of destination competitiveness.
Dwyer and Kim’s (2003) integrated model of tourist destination competitiveness was empirically tested in Australia, Korea and Slovenia (Gomezelj and Mihalic, 2008). The authors of these studies suggested that further research should be conducted to identify the relative importance of the different determinants of competitiveness within the context of specific destinations and specific visitor market segments (Gomezelj and Mihalic, 2008) and the importance of different elements of destination competitiveness in increasing the number of tourists from different market segments (Dwyer and Kim, 2003). By unveiling the determinants that define the competitive position of rural tourism in Uruguay and by understanding the customer profile of potential German rural tourists this paper has addressed some of these gaps.

The model to be employed in this research must be capable of explaining the success of tourism destinations in attracting international tourists. The general conceptual model of destination competitiveness developed by Crouch and Ritchie (1999) and further refined (Ritchie and Crouch, 2003) is the model that best meets these requirements. This model was selected for several reasons.

First, this model has been widely reported in the tourism literature and has been the basis for a large number of other research studies into destination competitiveness. Second, the model is based on at least eight years of research and has been refined and developed over an extensive period of time. Third, the model has a holistic approach that makes it suitable to be applied to any destination and tourism market.
METHODS

A positivist, deductive research approach was deemed the most appropriate approach to address the objectives of this research. The application of a well-known framework to the Uruguayan rural tourism sector has helped to identify the competitive position of Uruguayan firms within the selected industry. Two structured questionnaires were developed to collect the data, one administered to Uruguayan key rural tourism stakeholders, and another one to potential German tourists. A total of 185 questionnaires were completed. To establish validity, questionnaires were scrutinized by a panel of experts in the field. The first questionnaire was administered to 76 Uruguayan rural tourism stakeholders with knowledge or experience relevant to the topic. The sample size is the suggested to get results that are representative (with 95% confidence level) of the universe of Uruguayan rural tourism farms.

Participants were required to make judgements regarding the importance of the main factors and sub-factors detailed in the Crouch and Ritchie model of destination competitiveness. Respondents were asked to rank different Uruguayan competitiveness parameters against a five-point Likert scale, comparing Uruguay against its main competing tourist's destinations: Argentina and Brazil. The collected data was transferred to GenStat for statistical analysis.

The criteria used to determine the sampling frame was based on: existence of a homepage, website quality, total product offer, activities in the surrounding area, price, location and proximity to main roads. The chosen tourists' farms are distributed all over the country and therefore it could be said that the results are a fair representation of the rural tourist industry in Uruguay.

The second questionnaire was administered to a convenience sample of 109 potential German tourists. The study used the right sample size in order to get results that are representative of potential tourists attending “The Equitana fair” with a 95% confidence level. This questionnaire had two main parts. The first part aimed at revealing the attractiveness of Uruguay as a rural destination and the second part looked at the general characteristics of German tourists. The Equitana fair event, held in Essen Germany was recommended by travel agencies - supplying services to people interested in rural tourism - as the most suitable event to collect data from potential German tourists interested in rural tourism. Respondents come from different regions of Germany as depicted in figure 2.
RESULTS

I) Competitiveness of the Uruguayan Rural Tourism sector

In this section, the data collected from questionnaire one is presented against the main six competitiveness determinants suggested by Dwyer and Kim (2003).

*Table 1 Competitiveness determinants*
Inherited resources

Results from this study indicate that Uruguay as a rural tourism destination is well positioned compared to its South American competitors (overall grade 3.95 out of 5) in most of the attributes within this group (Table 1). Whereas natural inherited resources are graded with an overall mean score of 4.20, culture and heritage only attained an overall mean score of 3.74. The highest rating in this group of indicators was assigned to the country’s unspoiled nature (4.70) whereas the lowest scored was assigned to the level of cleanliness and sanitation with only 3.80 points. For these two factors a low standard deviation (0.41/0.45) indicates a high level of agreement between the respondents.

Created resources

There was much agreement among respondents about a slight superiority of Uruguay’s created resources compared to its counter rivals from Argentina and Brazil (Table 1). Results indicate that Uruguay’s main strengths lie in its airport efficiency and quality as well as its nature based activities.

Within this group of indicators, recreational activities such as special events and festivals that take place in Uruguay are rated above average, with a mean score of 3.86. This suggests that Uruguay is more competitive on this area than the competitor destinations. The standard deviation reveals that most participants share this opinion. Although created resources look promising for the future of Uruguayan rural tourism sector, standard deviation divergences need to be considered and therefore results should be interpreted with appropriate caution.

Supporting factors

Uruguay is considered to be more competitive than its direct rivals in most of the supporting factors, with most attributes rated higher than three. The rating of supporting factors indicates that the main competitive advantage of Uruguay as a rural tourist destination lies in the hospitality from residents towards tourists, which contributes to a positive experience while staying in Uruguayan farms. Supporting factors together with inherited resources have the highest average mean scores of 3.97 and 3.95 respectively, suggesting that these are the two main determinants of Uruguay’s favourable competitive situation. Whilst some supporting factors are perceived as good or very good compared to competing countries, the quality and quantity of training programs to enhance service quality has a low rating, with a mean score of 3.15.

Destination management

The results indicate that most respondents agree on the perception (SD: 0.55) that human resource management is one of the key factors limiting a further development of the selected industry. Results from the other groups of indicators within destination management are rated higher than human resource management. However, within the group of indicators for “destination policy, planning and development”, the existence of clear policies in rural tourism scored particularly low. The indicator with
the lowest rating within this dimension is the promotional activities of national tourist organisations in Germany, with a rating of 2.77, which shows that is the only indicator where Uruguay is clearly perceived to be less competitive than its direct rivals.

**Situational conditions**

Factors within this determinant can form the basis of competitive advantage in attracting tourist to Uruguayan rural farms. The overall ranking is positive but particularly, the German business environment factor has been rated very high by the majority of respondents. As shown in table one, political stability is another area where Uruguay has a clear competitive advantage against Argentina and Brazil, with a rating value of 4.25. However, this study has also identified the following areas where Uruguay is perceived to be less competitive: quality of research input; access to venture capital; domestic business environment; and foreign investment.

**Demand Conditions**

Dwyer and Kim’s (2003) argue that demand conditions are influenced by the international awareness of the destination and its products. The findings from this research suggest that the international awareness of Uruguay as a key rural tourist destination is similar to those of its direct competitors.

**PROFILE OF POTENTIAL GERMAN TOURIST**

This section will present the findings from the questionnaire carried out to German respondents at the Equitana fair.

**General characterization of participants**

Results indicate that 70% of participants travel with their partners. Within this group, 33% also travel with kids. Among the remaining participants, 19% tend to travel with friends and 11% travel alone. Most participants (65.06%) stated that relaxation and leisure was their prime motivation for travelling followed by sport and adventure (24.01%), culture (8.43%) and lastly social reasons (2.40%). The data collected indicates that, on average, a German tourist would spend 1,000 euros per week. Most respondents indicated that they tend to plan their holidays at least half a year in advance.

In spite of the lack of knowledge about Uruguay - as a rural tourist destination - 71.08% of respondents would consider travelling to Uruguay on a holiday. It is important to note that 10 participants had already been to Uruguay and all of them would like to return to Uruguay in the near future. Among those who would not consider Uruguay as a potential destination, the 13 hours flight was identified as the main factor that would discourage these potential tourists from visiting Uruguay.

Results from this study show that the travel patterns of those Germans willing to select Uruguay as a rural destination can be broken down as follows: 50.85% travel more than once a year, 35.60% travel
once a year, 3.39% travel every other year and 10.17% travel less frequently. Most participants (69%) who considered Uruguay as a potential rural tourist destination would like to stay in the country for about three weeks.

Participants declared that they gather information about travel destinations from the internet (26.05%), friends and relatives (22.33%), tourism catalogues (13.03%), newspaper (11.16%), television (10.70%), tourist agencies (8.37%), magazines (5,12%) and newsletter (3,26%). When asked about their preferred way of receiving information the ranking was clear: 39.81% opted for information sent by email, 29.13% for information sent by post, 25.24% are happy to search for information on internet and only 5.82% like to receive newsletters.

Most of the respondents (95%) who expressed their desire to travel to Uruguay were very interested in participating in some of the activities offered by Uruguayan touristic farms. Table two below depicts the ranking of participants’ activity preferences. Most participants (91.07%) were very enthusiastic about the idea of participating in several days trail rides.

CONCLUSIONS

Overall, compared to its main regional competing destinations, Uruguay does not possess a very strong comparative position. However, tourism stakeholders on the supply side rated Uruguay’s natural endowed resources and hospitality as the most competitive indicators. The authors believe that Uruguayan respondents have underestimated the marvels of nature that attract international tourists to competing destinations such as Argentina or Brazil. To overcome the lack of marvels of nature Uruguay should concentrate on adding value through offering high standard accommodation, excellent hospitality and service, and excellent marketing.

The findings suggest that Uruguay will have to create and convey the right message focussing on the range of activities offered in rural farms and their surrounding areas. The high level of correspondence between the profile of German tourists and the characterization of nature-based and
adventure tourists has revealed the significant potential of Uruguay as a rural tourism destination for Germans looking for nature and soft-adventure tourism.

The high level of security and the peacefulness that characterise Uruguay’s rural areas are highlighted in the literature and are accredited with Uruguay’s high fidelity level (Cotelo, 2011). This high fidelity level has been confirmed with the help of the data collected from German participants. Therefore, tourism stakeholders should capitalize on the excellent security levels of the country.

This study also recommends improving the indicators that are responsible for the relatively poor rating of destination management. For instance, it is necessary to establish a good educational system especially for participants on the supply side of rural tourism. This study has also identified opportunities where the public and private sector can work together to improve the competitiveness of Uruguayan rural tourism. The areas on which both sectors should focus on are: promotional activities in Germany, the development of clear rural tourism policies and a better integration of the sector into the country’s development strategies.

The rural tourism sector has not benefited from any tax reductions that traditional sectors of tourism in Uruguay have enjoyed in the past. Considering the potential of rural tourism to improve the economic situation of rural areas the government should consider implementing tax incentives to help rural farms to improve their competitive advantage. If rural farms attract more foreign tourists it could have ‘spill over’ benefits for many people in surrounding areas. Tax benefits would also help the rural tourism sector to offer a more competitive product which will help to attract price-sensitive tourists such as Germans.

ABSTRACT

The present research is mapping opinions regarding the consumers’ correspondence to the development of a pilot implementation of a business networking model with the use of IT in Greek wood and furniture sectors. The participating enterprises are aiming to their cross-firm cooperation related to the procurement of materials and intermediate products and outsourcing. Based on specially constructed questionnaire, the researchers addressed to 66 consumers of wood and furniture products. Findings have shown that, the potentiality of developing the proposed dynamic network, could constitute an innovative proposition which finds resonance to the consumers of wood and furniture products, based to the characteristic of real time purchases. The expected benefits of participating in such a network, could constitute a fundamental competitive advantage of the network’s enterprises. This fact is deemed to be of great importance for wood and furniture sectors, especially during the present economic downturn. Furthermore, supporting strategies should be developed. It seems that wood and furniture enterprises have not yet managed to develop trustworthy relationships among them and to spot the opportunities they have in developing cooperative activities using high technology, acquiring a fundamental competitive advantage. In order for this target to be achieved, they should focus to specific cooperative activities and to the exchange of entrepreneurial practices, without this strategic choice be in confrontation to their independent operation.

Keywords: business network, business model, innovation, value creation, wood & furniture enterprises, e-Furniture, consumers’ research.

INTRODUCTION

The present market study, has been implemented under the context of the research project "Dynamic networking of furniture manufacturing enterprises with the use of intelligent software agents (e-Furniture)", by the Department of Wood and Furniture Design & Technology - TEI of Thessaly. The project is funded by the operational program "Competitiveness & Entrepreneurship" of the National Strategic
Reference Framework 2007-2013 (NSRF 2007 - 2013), action "Supporting of SME’s clusters for R&D activities". The project is dealing with the implementation of industrial research aiming to the introduction of the related technology and experimental development of a prototype, intelligent agent based, IT system for supporting "smart" networking of manufacturing and trading furniture and wooden products enterprises. The participating enterprises are aiming to their cross-firm cooperation related to the procurement of materials and intermediate products and outsourcing. The use of the specific system is expected to lead to the reduction of procurements' and offering services’ cost, facilitation of outsourcing for the cooperative firms and integration of the products' and services gamut, having as a consequence the augmentation of customers’ satisfaction and firms’ competitiveness.

Motivation

Traditionally, competition of enterprises was a static meaning, with basic production factors to be responsible for the success or failure of a firm. But not any longer. Modern competition is unpredictable and extremely dynamic. The industrial and entrepreneurial competitive advantage is changing rapidly, because of the development of new innovative technology, shortness of products' life cycle and the introduction of new global competitors in the sector, such as China, Russia and India. It constitutes a reality that Greek furniture enterprises are facing during the last period, an unprecedented uncertainty and significant problems, as a result of the Greek and European economic downturn and recession, but also because of specific problems and stiffness of the sector in the country (Papadopoulos et al., 2012; 2009). Thus, strategic differentiation through the adoption of new business models based on innovation and extroversion, is more than ever out of great importance for the Greek wood and furniture enterprises. In that way they will be able to become more competitive and secure their viability.

LITERATURE REVIEW

During the last years there is a significant number of research highlighting the contribution of entrepreneurial strategy in business performance (Demeter, 2003). This tendency, includes research that brings forward the relation between business performance and manufacturing and other technology that is been used (Beaumont and Schroeder, 1997; Das and Narasimhan, 2001), quality management techniques (in relation to business personnel and to products/elements of enterprises) (Dow et al., 1999) and the sum of the entrepreneurial strategy (Robb and Xie, 2005; Li, 2000). On the contrary, marketing research and its applications, highlights the central role of the products and services value for the consumer or, the total evaluation by the consumers regarding the usability or value of products in purchasing decision (Gao et al., 2005; Woodruff, 1997; Anderson, 1995). The
capability in providing products with high added value for the consumers is considered as a fundamental element for enhancing competitiveness (Lindgreen and Fynstra, 2005; Sweeney and Soutar, 2001). Furthermore, modern consumer is more than ever oriented towards the direction of product’s value, giving simultaneously more importance to the best possible relation of quality/price. They tend to be also, more well informed and demanding (Peter and Olson, 2002; Blackwell et al., 2001).

Under this context, enterprises are almost obligated to adjust their products, processes and the way they approach their customers, following a model through which they could provide the higher possible value, based to knowledge, innovation, strategic differentiation and the understanding of consumers’ needs. Consumers’ behavior could constitute a tool for creating and developing successful marketing strategies with multiple benefits for the enterprises (Schiffman and Kanuk, 2000; Assael, 1998). For instance, better understanding of customers’ needs presupposes a plainly more rational use of business sources.

Value creation for enterprises and for consumers’ constitutes the core of every successful business model (Zott and Amit, 2010; Morris et al., 2005; Melville et al., 2004; Chesbrough and Rosenbloom, 2002). It could also constitute one of the most fundamental elements behind the success of a product, service or technology in the market. In traditional business models the proposed value towards the consumers is mainly based on meanings such as quality, design, functionality, low price or cost. Furthermore, traditional business models are aiming to bring forth ways in selling products/services to the consumers (Osterwalder et al., 2010). New business models presupposes the creation of new values and consumers awareness such in tacit and explicit values (Tukker, 2004), stressing these kind of customers’ needs, offering to the enterprises the competitive advantage, creating new opportunities in the market based on inspirational innovations.

Greek furniture production and trading are facing a continuous recession, because of the economic crisis, which has as result a significant number of sector’s enterprises to be at stagnation stage for a long period or to have stopped their operation (Papadopoulos et al., 2012; 2009). Besides these very negative indexes for the furniture sector, a number of inhibitory factors contributes towards this unpleasant situation such as, high labor costs, the lack of raw materials and of specialized personnel, the small size of the Greek enterprises, the irrational organization of firms, the lack of new production technologies and the deficient infrastructures in the sector (Papadopoulos, 2006).

Nevertheless, according to a recent study in Greece (Trigkas et al., 2012), the majority of the innovating wood and furniture enterprises are adopting existing production and distribution processes moving towards marginal improvements. Thus, we could argue that there is a growing need for the development of innovative promotion and distribution methods for the Greek wood and furniture
industries. On the contrary, according to the same research, it seems that Greek wood and furniture enterprises have not been able yet, to develop mutual relations and to several other organizations, based on trust, in order to effectively move towards the exchange of knowhow and best practices flows. As a consequence, the improvement of the cooperation between the sector’s enterprises is deemed of high importance, since the enhancement of cross firms bounds and of cooperative activities, along with constant investments in modern technology and the exchange of best entrepreneurial practices, could enhance the sector’s competitiveness (Trigkas et al., 2012), without this strategic choice to be in confrontation with the independent entrepreneurial activity of firms.

According to another research of Papadopoulos et al., (2012), the bigger Greek furniture enterprises are preferring to invest in processes reducing the production costs in order to confront the existing competition. On the contrary, SMEs’ choose strategic differentiation applying specific initiatives regarding their business model, since they could not become competitive regarding the production cost. Finally, despite the economic crisis and the dramatic consequences in families’ income in Greece, a recent study (Papadopoulos et al., 2014) has shown that Greek consumers are willing to pay extra for the added value that a furniture product may offer, based on technological and ecological innovations, satisfying specific needs. The same study concludes to “Greek furniture enterprises will have to focus to differentiation from the competition, innovating through the production and promotion of furniture products of high added value, a fact that could ensure a significant fraction of the internal market and boost extroversion (exports)”.

**GOAL AND SCOPE DEFINITION**

The present research will constitute a useful guide for furniture enterprises, since it is based to a pilot implementation of business networking model with the use of IT, a model that is introduced for the first time in Greece. The present market study is mapping opinions regarding the consumers’ correspondence to the development of such a network using sophisticated technology, which will aim to their service in real time according to their preferences and needs in furniture products, satisfying simultaneously the firm’s needs in materials etc. The expected outcome has mainly to do with the clarification of the opinions of the target group and potential stakeholders regarding the design, development and operation of a dynamic business network, in order to lead to required decision making regarding the forthcoming steps of the research on the network’s characteristics and operational elements.
RESEARCH METHOD
The primary data collection and elaboration followed the methodology of gathering, processing and editing according to the basic principles of marketing research (Gordon and Langmaid, 1988; Tull and Hawkins, 1990; Doyle, 1998; Aaker et al. 2004; Siomkos and Mavros 2008). Questionnaires were specially constructed for the purpose of the study with short and precise questions. The research was conducted by skilled researchers who addressed directly the entrepreneurs or executive members of the firms by personal face-to-face interviews.

The questionnaire included 13 questions on issues such as the cooperation and trust magnitude of consumers towards wood and furniture enterprises, their general attitude regarding the development and implementation of such a business network, product’s characteristics, services, benefits and services, as structural elements of the network’s operation according to their needs and preferences in real time. The final group of questions had to do with the profile of the participants in the study in order to detect the specific characteristics of the potential users of "smart networks" in wood and furniture products. The research took place during the period January 2013 - February 2014 using random sampling of 250 consumers all over Greece. Finally, a 26.4% of the sample corresponded translating to a number of 66 consumers. The questionnaire had been uploaded to http://inflab.kard.teilar.gr/e-Furniture/index.php/el/surveysgr?id=95 and the participants were notified by e - mails. A content validity of the questionnaire was used before its launch to the internet based on diligent discussions with wood and furniture enterprises and scientific experts in the field and literature review. A pilot questionnaire was addressed to five consumers and from this pre-sampling we manage to improve several parts of the questionnaire, improving its quality and shaping the final questionnaire (Dillman, 2000).

Data were edited and processed using SPSSWIN ver 17.0 and all the related tests of frequencies, descriptives and cluster analysis were made (Howitt and Cramer, 2003; Siomkos and Vasilikopoulou, 2005; Norusis, 2007), in order to detect the groups of consumers based to specific characteristics of their profile and the integration range of the network’s attributes - operations.

RESULTS AND DISCUSSION
The results of the study are considered to be of great importance constituting a core element of the entire e-Furniture research project, under the context of the direct consumers’ service according to their needs and preferences, but also under the prism of targeted and quick sales for the enterprises, offering a high added value service to their customers.

Regarding the question, which would be the initial impression of the consumers in case that a firm participated in a cooperative network giving them the opportunity to buy from distance,
automatically and at a real time, its products, the majority of the participants (42.6%) has stated that they would have a positive attitude against this potentiality, while the 37% would be very positive, as it is presented to the next Table 1. These results are considered to be quite encouraging, since the potentiality of developing the proposed dynamic network, could constitute an innovative proposition which finds resonance to the consumers of wood and furniture products, based to the characteristic of real time purchases.

Table 1. Initial consumers’ attitude towards networking enterprises for real time purchases

The above mentioned opinion is also based to the expected benefits for the consumers themselves (Figure 1), which have stated at a percentage of 60,5% that they could achieve time saving, 39,5% completed solutions according to their needs and preferences, 37,2% better prices, 16,3% better design and guarantees and 11,3% less stress during products’ selection and purchase. The specific expected benefits, according always to the participants’ opinion, could constitute fundamental competitive advantage of the network's enterprises. This fact is deemed to be of great importance for wood and furniture sectors, especially during the present economic downturn, which are facing a vertical decline to their financial and production amounts, in order to boost their entrepreneurial activity via "smart", affordable ways of selling and provision of completed solutions. These three competitive advantages constitute the basis of the competition mainly by multinational companies operating in Greece (Spanos et al., 2004; Porter, 1986).

![Figure 1. Expected benefits for the consumers by a potential dynamic networking of wood and furniture enterprises](image-url)
However, the 13% of the consumers that had a skeptic attitude against the potentiality of such a network and making purchases through this (Table 1), pose as basic hesitations (Figure 2): the willingness to be at personal contact with several enterprises in order to judge themselves the reliability and trust they could have towards them (62%), as well as the hesitation that this method of selling will not offer them the best possible quality, at a percentage of 25%, while a 13% poses several other reasons. Thus, it is of great importance the participating enterprises in such a network to secure the mutual trust of the consumers, providing them quality products and solutions. Thoughtfully, this effort should be supported by several supplementary strategies such as quality certifications, implementation of quality management systems, feedback processes, after sales service, etc. in order to bend as much it is possible whichever hesitation may exist towards this kind of a cooperative business model.

![Figure 2. Basic hesitations by the consumers regarding the potential participation of the enterprises in a dynamic cooperative network](image)

The characteristics to which the consumers give special attention before they move towards the purchase of a furniture product and which will have to constitute a structural information regarding the capabilities of the developing network, are presented in the next Figure 3. Results show that the capability of integrated services to the consumers should exist, that ensure products’ quality, low prices, design and guarantees at 31.4%, 31.1%, 21.1% and 14% respectively.
Simultaneously, the presentation of furniture products, along with the capability of the combination of their characteristics and selling methods according to the consumers’ preferences in real time, should be focused in attributes such as (Table 2): low price (33.3% of the responses considers it as quite significant and a 27.8% very significant), prototype and functional design (29.6% and 38.9% respectively), the offering guarantees (31.5% and 37% respectively), as long as after sales service at a percentage of 24.1% and 31.4% respectively, according to the significance volume for the consumers before they move towards the purchase of products. Thus, the developing network will have to embed to its operation these attributes, which fundamentally, are representing the expected benefits as competitive advantages of the network.

Finally, some other attributes that the project’s network could embed, as a result of the selling methods’ improvement, products distribution, after sales service and the building of a trustworthy environment between customers and enterprises, have to do mainly with customers service attributes (77,5%), selling according the customer’s preferences (70%), low pricing (52,5%) and the avoidance of mistakes in ordering (30%). Non observance of these attributes constitute one of the major reasons for interrupting cooperation with a firm, according to the responds of the participants as they are presented in next Figure 4.

The consumers profile that had participated to the present market research have shown that (Table 3), the majority (57,5%) were singles of 21 - 30 years old. A percentage of 32,5% states private employees with freelancers and students to follow (22,5% and 25% respectively). The average net monthly income is in majority (45%) below 1.000€ with these having income between 1.000€ - 2.000€ (30%) to follow. Their education has to do at a percentage of 67,5% with higher education, with post graduate studies to follow at a percentage of 25% of the responds. Regarding the kind of their residence, the majority (47%), has stated that lives in a single residence below 100 square meters with the residences of total surface between 100 – 150 square meters to follow (49% and 35% of the responds respectively).

CONCLUSIONS - PROPOSALS

Modern consumer of wood and furniture products, is more than ever, oriented towards the value of products, focusing to the best possible relation of quality and price. Especially during the present economic downturn having limited sources for purchasing, he gives special significance to market research for wood and furniture products with high added value for him (value for money).

Thus, it is of great importance the study regarding the basic attributes, functions and services that the project’s developing business dynamic network could integrate under the context of the direct customers’ service based to their needs and preferences, along with the focused and quick selling procedure for the enterprises, offering a high standard of customers’ service. The potentiality in developing such a dynamic network could constitute an innovative proposal finding resonance in wood and furniture consumers based to the characteristic of purchasing in real time. The majority of the participants in the present research has stated that they have a positive till very positive attitude against this potentiality.

The Future of Entrepreneurship
Results show that there must be the capability of integrated customers’ services, which could ensure products’ quality, low prices, design, and guarantees. Simultaneously, the presentation of the products along with the capability for combination of characteristics and real time sells according to customers’ preferences, should focus in attributes such as: low prices, prototype and functional design, guarantees and after sales services. Regarding the expected benefits for the customers themselves, it is recorded the time saving, the opportunity for perceiving of integrated services, better prices, better design, bigger guarantees and less stress during the choice of products. The specific expected benefits, according always to the opinion of the participant consumers, could constitute fundamental competitive advantages of the network’s enterprises. This fact, is of great importance during the present economic situation for the sectors of wood and furniture, which face a vertical decline to their financial and production magnitudes and wishes to boost their enterprises through “smart” entrepreneurial ways for selling products and integrated services, reachable for the consumers.

Furthermore, this effort should be supported by supplementary strategies such as: quality certifications, implementation of quality management systems, feedback processes, after sales service, etc. in order to bend existing skepticism that may occur against to such a cooperative business model. Finally, some more attributes that should embody the project’s network have to do mainly with: customers service, products sales according to the customers’ needs and preferences, sustain of low prices and avoidance of mistakes in ordering, as a result of sales, delivering and after sales service improvement, along with the development of a relationship of mutual trust between the customer and the firm.

It seems that wood and furniture enterprises have not yet managed to develop trustworthy relationships among them and to spot the opportunities they have in developing cooperative activities using high technology, acquiring a fundamental competitive advantage. In order for this target to be achieved, they should focus to specific cooperative activities and to the exchange of entrepreneurial practices, without this strategic choice be in confrontation to their independent operation. However, results indicate the adequate cooperation the Greek wood and furniture enterprises develop with their customers, based to mutual trust relationships, a fact that is perceived as very positive for both sectors. All is needed is for the firms to give the opportunity to the consumers to get to know one another and their products, after a systematic market research and spot value elements for themselves. The present research is proposed to be continued in order the number of the participating consumers to become much higher including all the age categories. Finally, the present research could be combined with a market study of the e-furniture’s project participating enterprises, in order for the
results to maximize their benefits and simultaneously satisfy in the best possible way the needs and preferences of the firms’ customers.

ACKNOWLEDGEMENTS
This research is part of the project under the title "Dynamic networking of furniture manufacturing enterprises with the use of intelligent software agents (e - Furniture)" and has been conducted by the Department of Wood and Furniture Design & Technology - TEI of Thessaly. It has been co-financed by the European Union (European Fund for Regional Development) and Greek national funds through the Operational Program "Competitiveness and Entrepreneurship" of the National Strategic Reference Framework (NSRF) - Research Funding Program: Supporting of SME’s clusters for R&D activities.

ABSTRACT

This Neuromarketing study compares the brain responses of men and women watching TV advertisements. High density EEG was used to record the neural activity of 10 female and 10 male participants while watching video stimuli based on an oddball paradigm with a frequent-rare ratio of 75%-25%. The advertisements were chosen according to their main target: male and female.

The sLORETA analyses showed that the prefrontal, fronto-temporal, anterior cingulate (ACC) and parieto-occipital cortices experienced higher activation during the visualization of TV ads, for both female and male participants. Specifically, the prefrontal cortex activity was found to be positively correlated to the likeability, attractiveness and pleasantness scores obtained in a questionnaire.

Furthermore, the results from multiple analyses indicated statistically significant differences between male and female participants in most of the electrodes. Females presented higher frequencies’ power and P300 amplitudes, as well as activated more brain areas related with emotions, particularly the ACC. Thus, it is suggested that men and women employ distinct cognitive strategies when processing TV advertising stimuli and, consequently, that neuromarketing methodologies and techniques are appropriate to assess the efficiency and effectiveness of ads in different segments, such as those defined by gender and age.

Keywords: Neuromarketing, EEG, Gender, Advertisements, Oddball Paradigm, sLORETA

INTRODUCTION

Neuromarketing is a research field that employs techniques and practices from Neurosciences in order to increase the knowledge about the human behavior in a Marketing context (Lee et al., 2007; Banks et al., 2012). This leads to the study of Marketing issues using different types of data, collection and processing methodologies, and scientific instruments whose rigor has been validated in the neuroscience field (Hotz, 2008; Ariely & Berns, 2010).
This research study focuses on the way men and women’s brains react to television advertisements, as gender is commonly used by marketers and advertisers as a core segmentation strategy whose success depends on a deep understanding of how men and women process marketing information, judge products, and behave in the marketplace (Putrevu, 2001). Since a TV commercial shows many elements that may stimulate the participant in a very short period, the electroencephalogram, or EEG, due to its excellent temporal resolution, presents itself as a reliable neuroimaging instrument to register the experimental data (Ohme et al., 2009). In particular, the EEG analysis of the Event-Related Potentials (ERPs) can help define the activation time-frame of certain mental operations, like the ones involved in attention, language processing, perception and memory, that are processed in milliseconds (Teplan, 2002; Vecchiato et al., 2012). The study of ERPs, and especially the P300 component are starting to be used in Neuromarketing (Ma et al., 2008). The P300 is a late positive peak mainly influenced by the frequency of stimulus presentation and the relevance of the task (Bledowski et al., 2004). It has been linked to higher-order cognitive processes of attention allocation, memory updating, and classification of stimuli. The attention resources required to process a given stimulus are thought to be directly proportional to the P300 amplitude. When the paradigm is held constant, the P300 has a higher peak for the stimuli that have either negative or positive emotional value to the participant, than for stimuli with neutral emotional value (Gray, 2004). Therefore, an oddball paradigm was selected for this experiment since it elicits the P300, while also increasing the statistical significance of the results by repeating the stimulus presentation.

To systematize, this research seeks to answer the following questions:

Q1) What are the areas of the brain that have an important function when people are exposed to a TV advertisement?

Q2) Is there a significant difference between men and women’s brain responses to TV ads?

Q3) If the answer to the previous question is “yes”, then what are the specific elements in the TV ad causing that difference?

Q4) Are the EEG, sLORETA® and oddball paradigm effective and efficient techniques and methodologies for a Neuromarketing research?

Finally, it is important to note that the use of neuroimaging to probe the consumers’ brain needs a deep reflection within neuroethics, because it is necessary to ensure that the parties who are involved in the research are protected from possible exploitation, or that the public in general is protected from eventual highly effective advertising that compromise consumers’ psychological autonomy. In order to comply with this concerns, the goals, risks and benefits of Neuromarketing research must be explicitly and clearly stated (Hotz, 2008; Murphy, 2008).
LITERATURE REVIEW

Previous studies attest the difference between male and female brain responses to certain stimuli. For instance, Neuroscience studies supported in the Marketing field validate the existence of gender differences at a biological level. These differences appear during the 8th week of gestation, when testosterone bathes the brain of the male fetus, causing the deactivation of areas involved in communication and activating regions associated with aggression and sex. On the other hand, the female fetus does not receive the testosterone bath, and so it has more regions related with emotions activated and it develops stronger interhemispheric connections. Thus, women tend to show more developed multitasking skills than men, and are more effective at processing emotional and rational information simultaneously (Putrevu, 2001; Ifezue, 2010; Pradeep, 2010; Sun et al. 2010). Other experiments in the Neuroscience field showed that: ERPs’ potential, such as the P300, tended to be more significant in female than in male participant (Bötzel & Grüsser, 1989; Steffensen, 2008) and men and women recruit different brain regions for spatial navigation (Grön, 2000).

Reviews carried out in the marketing field suggest that: gender differences can be also identified at a cognitive, behavioral and social level (Putrevu, 2001; Sun et al. 2010); men are most aroused when presented with sexual sources, such as nudity, while females are more influenced by romantic sources and tend to have an interest increase for male models (Ifezue, 2010); and males benefit from nonverbal reinforcement, and females benefit more from verbally descriptive messages (Putrevu, 2001). As for survey-based Marketing studies, the results indicate that: mood effects while processing advertisements vary with gender [n= 282 - 165♀, 117♂] (Martin, 2003); women characteristically score higher on intensity measurements of both positive and negative emotions [n=740 - 409♀, 331♂] (Moore, 2004); information is more important for males, while entertainment is more important for females, that are also more influenced by the interaction effect of information and entertainment [n=134 - 87♀, 47♂] (Sun et al., 2010); males were more aware of individualist messages, while females noted the collectivist emotional appeals present in the public-service announcements and were more persuaded by their content [n=578, 312♀, 266♂] (Andsager et al., 2002).

As for Neuromarketing, there is one study using MEG that considered gender to understand the neural mechanisms involved in the behavior of purchasing day-to-day items (Braeutigam et al., 2004). That studied indicated that at around 300 ms women activated regions of the brain related to category-specific knowledge, whereas men activated regions related to spatial memories. Also, there were larger γ-waves for women when a product’s preference was high. Additionally, in the many tests carried out by Neurofocus, a Neuromarketing company recently acquired by Nielsen, 90% of their studies detected differences between the cerebral reaction of male and female participants (Pradeep, 2010).
METHODOLOGY

Variables

Two variables were considered in this experiment. The first was the gender of the participant (male; female). The second were the dynamic visual stimuli (‘TVad’; ‘VidSeg’). Regarding the last variable, its two levels consisted in edited mute video segments. The ‘TVad’ segments were 5 different TV advertisements with elements that would provoke different reactions among the male and female genders. As for the ‘VidSegs’ they were 5 different video segments where there were no references to brands, as well as an absence of human faces and no elements that apriori might elicit different reactions among the two genders. Furthermore, each one of the ‘VidSeg’ segments had also to be related to its corresponding ‘TVad’ segment, in a way that their background and colors were alike.

Participants

The sample used in the research consisted of 20 healthy caucasian participants of the same nationality (mean age: 22.1 years), where 10 of them were male and the other 10 were female. They were all right-handed, had an age between 20 and 24, and had secondary education. The sample size of this research is in the same order of magnitude of various other Neuromarketing EEG studies, such as Bledowski et al. (2004), Gray (2004), Huettel (2004), Ma et al. (2008), and Astolfi et al. (2009).

Questionnaire

A questionnaire was administered to the participants and via email to other individuals of the same age range (20 to 24 years old) and education as the participants, making a total of 51 questionnaire answers. The main purpose of this questionnaire was to complement the EEG results with data obtained from a traditional marketing research technique. Three different scales (yes/no, Likert and semantic differential) were used to assess the 21 questions for each of the 5 ‘TVads’.

The oddball paradigm

The oddball paradigm was selected as it provided statistical power and significance to the results. It consists in randomly presenting two types of stimuli, one of them infrequently (oddball or target stimuli), and the other more frequently (standard stimuli) (Huettel, 2004). In this experiment, the target stimuli (‘TVad’ segments) and the frequent stimuli (‘VidSeg’ segments) were in a 25%–75% proportion. The participants were not asked to discriminate in any way the target and the standard stimuli presented in the video, thus this was a passive oddball paradigm.

Stimuli presentation
The video stimuli consisted of a set of 5 blocks, presented in random order. Each block contained the two types of dynamic visual stimuli with the same duration that were repeated in a proportion that enabled the use of the oddball paradigm. The composition of each block was: B1- Gioia (TVad) & Clouds (VidSeg); B2- Super Bock (TVad) & Street (VidSeg); B3- Nespresso (TVad) & City (VidSeg); B4- Gio (TVad) & Sea (VidSeg); B5- L’Oréal (TVad) & House (VidSeg).

The ratio of TVads to VidSegs was 25% to 75%, a rare-frequent stimuli proportion with a considerable amount of stimuli repetition. Each TVad segment was repeated 5 times, while each VidSeg segment was repeated 15 times. Thus, all the twenty participants were exposed to many presentations of the same stimulus, which consequently increased the number of analyzed cases (‘TVad’: 5x20=100; ‘VidSeg’: 15x20=300).

In between the segments of a block, there were inter-stimuli intervals (ISI) with a 4 seconds duration, consisting of a white background with a black dot in the middle, and it was used to obtain a baseline register between the presentation of each commercial.

Data acquisition and analysis

EEG was recorded from 61 Ag/AgCl electrodes, divided in 14 groups, using the 10-10 standard system (Oostenveld, 2001). 60 electrodes registered the electrical brain activity in the scalp, while the VEOG (vertical electro-oculography) measured the eye movements and blinks from the sub-orbit of the right eye, and the supra-orbit of the left eye (Waismann et al., 2003; Astolfi et al., 2009). The EEG signal was digitally recorded offline with a sampling rate of 2000 Hz. The data was then processed with Analyzer® 2.0, starting with an automatic raw data inspection that limited brain electrical activity to a minimum of 0,5 μV. The processed data was then segmented based on the type of stimuli: ‘TVad’, ‘VidSeg’, and ISI. Finally, the EEG records of those segments were averaged for each individual, and a grand average was later performed for all the participants, 10 male and 10 female participants.

The multiple analyses developed to meet the objectives of this experiment included:

1) statistical analyses of the answers to the questionnaire, which were subjected to a dimension reduction, using exploratory factor analysis (EFA) following the good practices of Hair et al. (2010).
The software used was the IBM SPSS®, the extraction method was the “Maximum Likelihood” with Eigenvalues greater than 1, and the “Direct Oblimin” was chosen as the method of rotation. The factor analysis was performed on 255 cases (51 respondents x 5 ‘TVads’) and the questions were grouped in five factors, attaining a Kaiser-Meyer-Olkin (KMO) value of 0.836 and Cronbach’s Alpha for total reliability of 0.817. These five factors were responsible for 75.88% of the total variance.

II) t-test analysis of the EEG records of the male/female participants.

III) frequency analysis, where frequency brain maps were generated by Analyzer®, to show the distribution of the frequency wave bands in the scalp, for all the video stimuli. The selected frequency spectrum (4-60 Hz) covers the Theta, Alpha, Beta and Gamma waves. The Delta waves were not taken into account as the amplitude of these waves, enhanced by the oddball paradigm, was considerably higher than the remaining (Başar, 2001).

IV) inspection of the amplitude and latency of ERP's.

V) results coming from standardized low resolution electromagnetic tomography (sLORETA) which provided additional information about the localization of the neural sources responsible for the electrical activity recorded in the scalp. The sLORETA was selected to complement the results obtained with the EEG recording, because it presented an approximate solution for the inverse problem with an accurate localization (5 mm) of the neural sources in 3D space (Pascual-Marqui, 2002).

All the t-test analyses performed in the multiple analyses were two-tailed, with $\alpha=0.05$, except for the calculation of the t-threshold with sLORETA, where one-tailed tests ($A>B$) were used.

**RESULTS**

*Questionnaire results*

The detailed information about the five factors provided in Table 1 indicates that, besides the acceptable reliability value of factor 4, the remaining factors were very reliable (DeVellis, 2003). The resulting data enabled to display graphically how all the respondents classified the 5 ‘TVads’ (see Figure 2).

Figure 2: All participants’ answers to the questionnaire grouped in factors, for all ‘TVads’.

Gioia and GIO ‘TVads’ varied similarly along the five factors. As for the Nespresso ‘TVad’, it obtained steadily high scores in the five factors and thus can be inferred to be the most successful of the ‘TVads’. Finally, the Super Bock and L’Oréal ‘TVads’ displayed almost symmetrical scores. The L’Oréal advertisement attained overall lower scores (except for factor 4) it was not very effective for the population associated with this experimental sample, as it targeted an older female audience, not represented by the young female sample.
EEG results for full TV advertisements

In this analysis, the grand averaged EEG records of 10 female and 10 male participants were compared, using an independent t-test. For almost all the groups of electrodes and for all the TVads, the p-value was 0% (p=0,00), implying that the EEG records of female participants were statistically different from the male.

As for the frequency brain maps, the more interesting results showed that female participants had very active Alpha frequencies in the occipitotemporal area, particularly in the occipital region, whereas the male participants had a much smaller activity of Alpha waves concentrated only in the occipital cortex. Moreover, female participants had slightly less Alpha activity for the Super Bock and Aqua di Gio advertisements, which implies that female participants paid more attention or processed more information while watching these TVads, as Alpha rhythms have been inversely related to neural engagement (Feige et al., 2005).

Finally, higher Beta and Gamma power was detected in the advertisements with protagonists which were ranked higher in terms of sensuality/sexiness and beauty (Gioia for male participants, and Gio for female participants). Beta and Gamma waves were associated with attention engagement, especially over the frontal and central areas (Başar, 2001; Braeutigam, 2004). Beta oscillations imply higher levels of information processing, and Gamma waves reflect stages where information is actively processed, as those involved in cognitive or motor functions (Niedermeyer, 2005).

EEG results for segmented dynamic visual stimuli (0-850 ms)

This analysis focuses on the statistical results coming from t-tests, the ERPs’ latencies, and frequencies, for the initial 850 ms of the TV advertisements and frequent stimuli.

Considering the male and female participants as two independent samples, t-tests were used to compute the difference of the EEG records’ mean values of the 10 female participants with the 10 male. The groups of electrodes that did not attain statistical significance in terms of gender difference were the left and right frontal pole, left frontal, right temporal, as well as left and right occipital, for the Gioia TVAd; the central and right parietal, for the Nespresso ad; and lastly the left occipital together with the left and central parietal, for the Gio advertisement. The Super Bock and L’Oréal advertisements were the only TVads with significant results for all the groups of electrodes, which might have to do with the fact that both were considered by the respondents of the questionnaire to be clearly targeting a male (Super Bock) and female (L’Oréal) audience.

In the ERP analysis, the P300 was considered to be the largest positive deflection in absolute value within the 300 to 700 ms epoch (Gray, 2004). For example, in Figure 3 (Gioia TVAd) it is possible to discern a positive peak at around 300 ms for both male and female participants. Additionally, a positive deflection was also observed 300 ms after stimulus onset in occipitotemporal channels. Sites
T6 and PO10 had a higher P300 for male participants than female. As for the Nespresso commercial, the prefrontal electrodes registered a clear peak at 380 ms that was especially prominent in female participants. Regarding the Gio ad, in the prefrontal channels there was a small positive peak at 300 ms for male and female participants, though female also registered a pronounced late positive potential at 600 ms.

As for the frequency analysis, it reinforced the validity of selecting the ‘VidSegs’ as the standard stimuli in the oddball paradigm, because ‘VidSegs’ Street, City, Sea, and House, displayed little to no activity of Beta and Gamma rhythms in the participants’ scalp, which suggests that, unlike the ‘TVads’ that had Beta and Gamma power, the ‘VidSegs’ did not involve explicit cognitive processes (Başar, 2001; Braeutigam, 2004). Other relevant results indicate a high prefrontal Gamma (39 to 46 Hz) activity in the Gioa ‘TVad’ for male participants, while female had also similar Gamma power distribution for the Gio ‘TVad’. Concerning the Super Bock ad, female participants displayed left frontotemporal Gamma activity, whereas male displayed it in the right frontotemporal region. The Nespresso advertisement, in accordance with the results obtained from the full TV advertisement frequency analysis, showed barely no Beta and Gamma wave band activity, particularly in males. Finally, there was a thin frontal distribution of these wave bands for the female participants, when watching the L’Oréal commercial.

\textit{sLORETA (0-850 ms)}

This analysis compared the areas of the brain that were activated during the participants’ responses to the ‘TVads’, against their responses to the baseline from the corresponding Blocks, for a small time interval of 0 to 850 ms. The calculations were performed by grouping the 10 female (or male) individual averaged data from the EEG recorded during the presentation of the ‘TVad’, and the ISI belonging to the respective Block. These groups were then compared using a one-tailed paired t-test, where A(‘TVads’) > B(ISI).
The sLORETA generated 3D models of the participants’ brains, more specifically the grey matter (Lancaster, 2000). In Figures 4 to 8 it is possible to see the slice view maps displaying the differences between the 5 ‘TVads’ and their respective baseline EEG registers.

Figure 4: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (Gioia vs ISI).

Figure 5: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (Super Bock vs ISI).
Figure 6: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (Nespresso vs ISI).

Figure 7: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (Gio vs ISI).

Figure 8: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (L’Oréal vs ISI).
DISCUSSION

Throughout the multiple analyses performed, the prefrontal, frontal, frontotemporal, parieto-occipital and occipital cortices, as well as the limbic system, experienced greater activation for the ‘TVads’ than for the ‘VidSegs’ and ISI. P300 peaks, which are positively correlated with attention, were elicited in those areas. There was also higher activity for the wavebands associated with cognitive processing (Beta and Gamma). Consequently, those brain areas are thought to have an important role in the processing of the TV advertisements stimuli. Particularly, in the sLORETA results, the prefrontal cortex (medial frontal cortex) and ACC stood out for their involvement in the processing of emotions conveyed by the ‘TVads’, and the prefrontal cortex activity was found to be positively related to the likeability, attractiveness, and pleasantness of the ‘TVad’. The prefrontal cortex has been implied to be involved in high-level planning, regulating emotions, and higher-order cognitive processes (Plassmann et al., 2008). This answers the 1st research question.

Furthermore, the results point out clear differences between male and female responses to TV ads: females usually presented higher frequencies’ power and ERPs’ components than males (Bötzel & Grüßer, 1989; Steffensen, 2008). In addition, females usually activated more brain areas than males, in particular the anterior cingulated cortex (ACC). Thus it is possible to suggest there are different patterns of neural activity depending on the gender, leading to distinct strategies and cognitive patterns employed by men (heuristic approach) and women (elaborative approach), which is in accordance to the findings of Martin (2003).

It is also important to point out that a small peak appeared at around 600 ms in the Gioia advertisement, for both male and female participants, whereas in the Gio ad there was a sharp P600 for females, and no relevant positive deflection for males at that specific time. Knowing that the P600 has been suggested to be an erotic preference indicator (Waismann, 2003), and having in mind that Gio’s protagonist received the highest scores for the sexiness/sensuality criterion from female participants it is possible to infer that female participants had an arousal response to the Gio ‘TVad’. On the contrary, Gioia did not elicit prominent P600 even though the protagonist also scored high in that criterion for both male and female participants. A probable explanation is that the female protagonist in the Gioia ad was wearing clothes, while Gio’s protagonist was bare-chested and only wore swimming trunks, which has more propensity to stimulate arousal in females. Thus, the 2nd research question is addressed.

Regarding the 3rd research question, and based on the answers to the questionnaire, the protagonists, the humoristic content and the familiarity with the brand of the ‘TVad’, were the elements most likely causing the differences observed, as they strongly influence the overall likeability and attractiveness of the advertisements.
Finally and critically, the independent t-tests confirmed the significant differences between the male and female participants’ neural activity for most groups of electrodes and ads.

CONCLUSION

To sum up, by using techniques and methodologies such as the EEG, sLORETA®, and the oddball paradigm, alongside with a questionnaire, this Neuromarketing study presented results that pointed out significant differences between the way male and female participants process the TV advertisements stimuli. Therefore, the 4th research question is validated.

It is thus suggested that this type of study is appropriate to assess the impact of ads in different segments, such as gender and age, since neuroscience can complement traditional marketing with rigorous, reliable and scientifically-sound methodologies and techniques, allowing greater insight on the neural mechanisms behind consumer behavior. Additionally, Neuromarketing studies require smaller sample sizes than conventional studies (Hotz, 2008; Pradeep, 2010), enabling more effective and cost-efficient marketing campaigns.

ABSTRACT

Social media are leading to major changes in business and consumers’ behaviour. The aim of this paper is to achieve a deeper understanding of an ongoing evolution of consumers’ role based on their increasing willingness to assume a proactive role that goes beyond the co-creation of value - in terms of their participation through social marketing tools - to include financial support of producers. For this purpose we have chosen a case study approach, analyzing the unique feature of Naked Wines (“NW”) experience, a prominent online wine retailer established in UK since 2008. NW consumers can choose to invest in wines, before that they are produced, financing the business of winemakers and they can have a leading role in the evaluation process (i.e. tasting and scoring) of wines.

The paper is organized in four sections. In the first, we explain why and how multichannel marketing (off-line and on-line and) is used to cope with changes in consumers’ behaviour. Then, we look at the relation between wine business and the multichannel marketing in UK. The following section focus on NW in order to highlight: roles and responsibilities of two consumers’ profiles (Angels and Archangels), relationships with winemakers, and interaction devices in use (marketplace, blog, app). Finally, through the analysis of some questionnaires, administrated online to the Archangels, we attempt to investigate on their motivations, commitment and feedback, to improve NW activities in the future.

Keyword: Multichannel marketing, Wine industry, Naked Wines, Disintermediation, Crowd founding, Social proof.

INTRODUCTION

Social media are leading to major changes in the way to do business and to reach and to engage consumers. The aim of this paper is to achieve a deeper understanding of an ongoing evolution of consumers’ role based on their increasing willingness to assume a proactive role, that goes beyond the co-creation of value - in terms of their participation through social marketing tools - to include direct...
financial support of producers. For this purpose, we have chosen a case study approach, analysing the experience of Naked Wine (“NW”), an online specialist wine retailer established in UK since 2008, that developed a successful online business based on the disintermediation of middlemen and on the building of a direct relationship between producers and consumers, who took a proactive role in directly financing winemakers. Our qualitative analysis is based on secondary data taken from NW websites, press reports and articles as well as primary data gathered through interviews, based on a questionnaire - administrated online to the more involved individuals who participate in Naked Wines business, the so-called Archangels.

The paper is organized in four sections. Firstly, we briefly analyze how the evolution of available technologies (e.g. internet and mobile devices) and changes in consumer behaviour has leaded to the development of multichannel marketing approach, i.e. traditional marketing channels are integrated with non-conventional ones. After this, we look at the relation between wine business and the multichannel marketing in UK. E-commerce has become one of the most profitable opportunity to catch consumers, exploited by large grocery retailers and direct-to home wine specialists. In the third section, we highlight the distinctive and unique feature of NW business model. In particular, we discuss: roles and responsibilities of two specific profiles of consumers (Angels and Archangels), relationships with winemakers, and interaction devices in use (marketplace, blog, app). Finally, we present the results of the interviews and discuss the characteristics of Archangels and their commitment and motivations to participate.

MULTICHANNEL MARKETING TO FACE NEW TRENDS IN CONSUMER BEHAVIOUR

The changes in the society of the postmodern era is undoubtedly related to the rapid evolution of technologies available to businesses and consumers determining, therefore, a broader view of the traditional concept of marketing (Simmons, 2008).

In the third millennium, consumers are characterized, among other things, by a renewed need for sociability (Boaretto et al., 2011). In this social context, new relationships arise based on the need to establish a group or a community and tribe. These social entities share a common interest as well a passion or it may be a previous/rediscovered bond of friendship, etc. One of the characteristics of this type of relationships is the facility with which it is possible to enter or to exit by this particular social context and the absence of relative costs. The implication for marketing is that consumers can move from one purchase scenario to another with a dramatic mobility, never experienced before. It is this “enhanced” capability that defines the mobility as one of the dimensions that characterize postmodern consumption (Semprini, 2006). Mobility has two dimensions: physical and mental (conceptual).
The physical mobility refers to the worldwide as well local movement of people, goods, informations and money. This event has been increased in last decades thanks to new technologies. The mental mobility is related to the capability to develop more activities at the same time. That implies a stratification of contexts (Boaretto et al., 2011), in which it is possible to travel, to socialize, to purchase and to work in the same context (train, station, airplane, etc.) using, for example, a wifi connection.

The expression homo mobilis refers to a person/consumer/client that has the opportunity to be steadily wireless connected to satisfy daily needs. The so-called mobile devices are capable to allow this condition. Through the last generation of these instruments, such as smartphone and/or tablet, the mental mobility condition is facilitated. In this scenario, people display needs through multi-modal patterns and for this reason are involved traditional marketing methods as well those of non-conventional marketing. In particular, Kaplan (2012: 130) defines mobile marketing as “any marketing activity conducted through a ubiquitous network to which consumers are constantly connected using a personal mobile device”. Consumers to satisfy their own needs use the online channel (e.g. promotion via web, email, blogs, websites, mobile connectivity devices) such as the off-line channel, e.g. traditional media, in-store promotions, events, to get information and compare the characteristics of the products/services before purchase. This scenario defines the cross-channel behaviour: the potential consumer/user performs the act of purchase using/passing through (in the marketing literature, these people are called web surfers giving the idea of the dynamic of their consumer behaviour) from a marketing channel to another (Arikan, 2008). The significance of the different channels and their related tools is connected to the phase of the buying cycle to which they refer. For the overall effectiveness of multichannel marketing strategy is crucial the continuous “contact” between the marketer and his/her customer. So, it is defined the multichannel marketing that “refers to marketing communications delivered on multiple media in parallel and, hopefully, in a coordinated fashion. The term also implies that responses to marketing initiatives are accepted from multiple channels” (Arikan, 2008: 8).

In a traditional marketing context, it could happen that the target segment remains “uncovered” due to a lack of tools to follow customers in their new status of mobility. However, that does not happen in the multichannel marketing scenario because through the lift effect it is possible to create opportunities for interaction with the customer depending on the physical place/mental state in which she/he finds. This condition allows capitalizing the value of the relationship with the customer for every point of contact. Using the applications of mobile marketing, such as those that refer to the mobile social media group - that “allows the creation and exchange of user-generated content” (Kaplan, 2012: 131) – the company can interact with the customer in those stages where traditional marketing cannot reach he/she. However, it is useful to clarify that it is not a condition of “control” of the customer but a new opportunity for interaction with him/her – e.g. the follower pages or “I like/I dislike” on the social
networks as Facebook.

The co-creation strategy works in synergy with the lift effect. That means that the experiences and the suggestions of consumers become part of the contents of communications and strategy firm: “...buyers what to be in charge” (Arikan, 2008: 7). The best way to involve and associate the consumers consists in giving them the opportunity to leave their impressions and suggestions in the web hosting company (Mangold and Faulds, 2009). One of the most used tools is the feedback through a blog. In many situations, contributors are rewarded with special mentions and with the offer of dedicated services. In this way the company is able to optimize the entire marketing campaign: picking up the real needs, making a more effective communication strategy and reducing the costs of deploying content available through interface devices, avoiding a potential failure if it is not “... listened customers’ voice” (Waisberg and Kaushik, 2009). The last but not the least advantage of the co-creation strategy is that it allows the activation of earned media. In fact, thanks to the comments let on the social networks and corporate websites, the company expands its benefits, in terms of: brand and corporate reputation, buyers’ confidence, credibility and transparency, improved efficiency in sales management. In particular, the e-commerce sites to increase the confidence of buyers exploit the social proofing i.e. the fact that people tend to believe that decisions and actions taken by the majority reflect the correct behaviour in a given situation. If customers can see how other people are using a site, which products they are buying, this provides them with a security. So, to take advantage of this behaviour, e-commerce sites need to create an experience, which shows to potential customers that they’re not the only people making the same purchase decision.

**WINE INDUSTRY AND MULTICHANNEL MARKETING IN UK**

An interesting case of multichannel marketing approach is the wine market in the UK. In the UK supermarkets hold a 45% share in wine sales, followed by specialty stores (25%), on-trade (20%), and small businesses and grocers (CBI, 2011). From 2007, economic scenario has hit all players in British wine market, as well as, has caused a change in the habits of purchase. In this period, grocery retailing has become increasingly concentrated in the hands of few chains (e.g. Tesco, Asda, Sainsbury’s, Marks & Spencer). The strategies of large grocery retailers are, on the one hand, the same as always, to sell larger quantities, subtracting them to the competitors through price based strategies; on the other hand, to develop strategies to capture consumers everywhere and every time. The price based strategies aim at a competitive price compared to competitors and, at the same time, which may provide added value to the bottle. In recent years, the solution adopted by British retailers aims to exclusive or semi-exclusive agreements with large wineries, in order to obtain labels with their own brand or that of the producer but exclusively for their market. The major retailers have exploited the internet technologies
to create opportunities to develop competitive advantage through streamlined operational costs and e-commerce have offered the opportunity to meet needs of the consumer for a more efficient use of the time devoted to the purchase, as well as a price advantage and to introduce innovative new services to capture consumer interest and deliver customer benefits (Ellis-Chadwick et al., 2007).

Wine consumption increased slightly, despite the negative influence of high taxation and consumption off premise has grown more than consumption on premise (Rabobank, 2013). In addition there are more people who say they feel competent and they attribute to the grape variety (i.e. the first criterion of purchase in the UK) and the terroir more importance than before, at the time of purchase (Wine Intelligence, 2013). In this last decade, the wine consumer behaviour is evolving in a way that reflects market changes and the novelties in the information and communication systems. New segments are defined in addition to the traditional ones. In particular, there exist consumers belonging to the segment defined “tribal”, for which the sense of belonging derives from being part of a group; others belong to the group “being there” who wish to share consumption experiences; finally, there is a segment of wine consumers so called “transparency” that looks at traceable honesty to reassure their sense of responsibility (Halstead, 2014). In the mobile marketing scenario, a large number of applications - designed for mobile devices - allow consumers to get closer to the world of wine, in a personal way and without the mediation of an “expert”. This aspect satisfies not only those who want to shop in the most convenient way (both in terms of price and time) but mainly those who are newcomers to the wine world and those who want to share their experiences of consumption.

In Britain, online wine sales are now an important retail vector channel. According to a Wine Intelligence report (Schmitt, 2013), the UK online wine market accounts for 11% of total wine sales in the country (worth £800 million). The sector has grown by 470% in the past 8 years – equivalent to a compound annual growth rate of 21%. Much of the recent growth has come from consumers using supermarket home delivery services to order wine, as opposed to the more traditional direct-to-home wine specialists who generally sell wine by the case. The growth of online grocers and the proliferation of handheld mobile devices have been such that 25% of UK wine consumers are now shopping online. Tesco has captured about a quarter of all internet wine sales in Britain and the Tesco Wine web site (Tesco Wine by the Case) provides wine selections very convenient respect to the variety offered and delivered in short time (a day or a few hours). In addition to the leading supermarkets and specialist shops which sell wine online, there is a number of online-only wine stores and wine clubs which are growing in popularity, some supply to restaurants and stores in addition to customers, while others are oriented towards delivering wine directly to the consumer. Among them Naked Wines is the most visited UK online wine retailer in the drinks category and the 18th most visited drinks website globally (Tabraham, 2013).
NAKED WINES: INNOVATION IN WINE BUSINESS

In 2008, Naked Wine (NW) was launched in UK as an online wine retailer. The company sells wines mostly produced by medium-small sized independent winemakers from around the world. NW ships an average of 20,000 bottles every day and it has over than 200,000 online customers. The company structure is formed by Naked Wines Int. which operates in three reference markets (i.e. UK, USA and Australia) and controls the financial aspects through two distinct companies (Naked Wines Prepayments Trustee Co Ltd. and Naked Fine Wine Bonds plc).

The innovative idea of the business is to offer to customers a very different experience of buying and consuming from those usually based on shopping standard wines in supermarkets. NW customers can choose to invest in wines - before that they are produced - financing the business of winemakers and they can have a proactive role in the evaluation process (i.e. tasting and scoring) of wines. Moreover, to all the customers is guaranteed, thanks to a very efficient logistics, the delivery of orders within the next day, with a full money back guarantee. From the supply side the innovative idea is the participation of independent producers - who by their productive and financial dimensions - would have difficulties to sell into conventional marketing channels. In this way, Naked Wines has become the first online marketplace that brings together small independent producers of wine, enhancing it, and creating a direct sales model jumping the inefficiencies and costs of long distribution channels with the various stages of mediation, thus facilitating producers.

Naked Wines - who: wine Angels/Archangels and winemakers

Naked Wine is based on the participation of two customer profiles, the Angels and the Archangels, who assume different roles and responsibilities.

Naked Wine Angels are a very special group of people who support winemakers by investing £20/month into their NW account towards their next order. In exchange, they pay an angel price saving at least 25% and up to 50% every time they buy. They get access to a whole host of other benefits such as: a free premium bottle every month if they order a case, or/and invitations to exclusive tasting events. The funds collected from Angels and Archangels are invested by NW in financing new suppliers.

Some Angels can assume a more proactive role becoming Archangels. Archangels are required to be ambassadors of the company with which they communicate directly on a closed area of the website. They are asked to undertake different functions. They are involved in reviewing, tasting and searching of wines; to examine the website looking for weaknesses; to help new members to be confident with the community and to feel that they are in a friendly and helpful environment; to give consumers ideas of what wines they might try, given their tastes, and encourage them to try new products. Archangels should support Angels in different ways; mainly, assisting them in the website use, being confident
with wines’ reviews, advising them on some new tasted wines and in general engaging them to be part of the community. Respect to the relationship with the producers, Archangels operate as a promoter suggesting their wines to new Angels.

Naked Wines currently works with more than 130 small-medium sized winemakers across 13 countries. There are two profiles of eligible suppliers: winegrowers with bottled wine ready to be placed in the market, or producers who needs a financing to support future production. NW supports their orders, production costs, salaries, trading and shares a per-bottle profit with them. When the wine is ready for selling, the winemakers send samples to NW, where they are tasted and judged by experts who will decide whether or not to buy them. The wine before to be put in the network is analyzed to ensure that it complies with the EU standards and if it does not pass the conformity test it will be returned, at no cost, to the producer. NW is interested in long-term relationships and works, only, on a cost plus basis. The idea is to develop a strategic win-win relationship to get quality up and prices. Winemakers benefits are: get cash flow early, don’t incur in debts or finance/storage costs, know in advance exactly how much to bottle and when.

*Naked Wines - where: NW marketplace, Blog, App*

The web is the action’s context in which the company operates. The Naked wines marketplace is a virtual market where producers pitch their wines and consumers make their bids. Each month, NW invites some winemakers to propose their wines, displayed on a virtual shelf, ready to be chosen by consumers at the best price negotiable – which includes shipping, delivery and 10% commission to Naked Wines. The deal is on if the bids reach a minimum volume; in this case the wines will be shipped directly from the winemaker in one go and without additional costs.

Through the online platform, NW offers a social experience with an innovative approach to customers’ relationship – engaging them in its philosophy - not limiting to be just an e-commerce site (Quispel, 2013). Sociality and interaction are promoted through the individual online blog - Naked me - and the smartphone App available exclusively for the Angels. Naked Me is a personal feed, where is displayed everything that’s relevant to the customer (e.g. a list of wines from the last order; updates from the followers, including recommendations; in case of Angels: free bottle alerts; stock alerts for favourite wines). Moreover, it is possible to interact chatting with winemakers or joining in discussion groups.

The Naked Wines Mobile is the place where, exclusive for Angels, it’s possible: to see the videos uploaded by the winemakers; to improve their knowledge about wines; to search for friends, offering them to become Angels; to chat with the winemakers on their message boards or into groups; to give scores to wines sharing them on Facebook or Twitter; to order wines.

*Naked Wines - how: disintermediation and social proof*
NW business model has two distinctive features that need to be highlighted: disintermediation and social proof. Disintermediation refers to the process of “cutting out the middleman”, that means the reduction of number of links in the supply chain by eliminating certain functions and intermediaries. Naked Wine is a prominent case of double disintermediation in wine industry, e.g. distribution and financial function (Veseth, 2013). On the one hand, by direct sales, NW cuts out agents and distributors that contribute with, more or less, a margin of 50%, to the final price of a wine bottle. On the other side, NW collects finance to sustain winemakers through a large pool of backers (i.e. Angels/Archangels), cutting standard financial intermediaries and exploiting the web opportunities of crowd funding (Mollick, 2014). Moreover, NW uses loan interest rates more convenient than those charged by banks.

In September 2013, NW launched a financial bond to raise funds for fine wines offering consumers 7% gross in cash interest p.a. or 10% gross in Wine Credits p.a. (a credit to their Naked Wines account) - raising £5 million in a month. They create a new company to issue the bonds, Naked Fine Wine Bonds plc, which holds and/or invests money in wines and owns the wines until they are ready for sale, when they will be sold to other companies in the Naked Wines Group for onward sale to Naked Wines' customers. In particular, NW invests only in grapes, barrels, bottles, and other direct production and administration costs. The mechanism of Fine Wine Bonds (FWB) gives the chance to operate in a kind of futures market; so when wines are imported into the UK the consumers have the opportunity to buy fine wines, prior than the others, at a competitive price. Finally, FWB might help to minimize the risk associated to bad weather conditions and poor harvests, recruiting different winemakers from many regions. The second distinctive feature of NW is the enhanced exploiting of the potential of offered by social proofing. Naked Wines makes effective use of consumer reviews and user comments across its website. Entering the home page, it is possible to notice the innovative and wide approach to customer relations. They are encouraged to become actively involved in the project in various ways: by communicating directly with the winemakers, commenting on the wines and providing suggestions on the website forum. They can eventually build a profile and find new companions enthusiasts to share ideas and experiences, e.g. visits with wine tasting in the cellars of the producers.

**INTERVIEWS’ RESULTS: ARCHANGELS’ PROFILE AND MOTIVATIONS**

To assess Archangels’ motivations with Naked Wines, 17 interviews were carried out through questionnaires administrated online. The principal socio-demographic characteristics of our sample are: i) respondents belongs to a wide range of ages, from 30 to 60 years; ii) nearly a quarter of them are women; iii) they have a medium/high education level - on the basis of the information provided about their job. The survey consists of 6 questions and aims to investigate about motivation, commitment and feedback in business development. For each question, the main results are reported below.
1) How did you find Naked Wines?
About half of respondents have found NW through a discount voucher or an advert flyer, while only 2 of them surfing into the online wine clubs.

2) Why did you decide to become an Angel and then an Archangel of Naked Wines?
Only 5 of respondents stated that the main reason that led them to become an Angel, was purely the price. For the most part of them, the motivations are more complex and are also the reasons by which they have agreed to become Archangels i.e. through the invitation of other Archangels or of NW. The given answers allow identifying the following three basic motivations: a) I like the business approach and the quality of wine; b) I like the social aspect and the online community, that permits me to learn more about wine and to discuss about it with other interested people; c) I like interacting with small boutique winemakers, supporting and promoting them.

3) What are the benefits of being an Angel and an Archangel?
Mainly, the benefits of being an Angel are related to the cost of wines, given that there are discounts available to support monthly financial commitments. Instead, the benefits of being an Archangel are perceived differently, consistent with three basic motivations outlined above.

The first group of Archangels highlighted that the most valued benefits are related to the opportunities to test wines and to participate at special events. Archangels have indeed the benefits from get sent wine samples - to try, to rate and to give a feedback - before that they are proposed onto the website. Occasionally there are special events for Archangels run by Naked Wines, such as tastings and meeting with new winemakers in order to find new wines to trade. Wine tours and invitations to trade fairs are potentially available on a selective basis. Recently, few Archangels went to California looking for of new wines and a team of them visited the Prowein Wine Fair in Germany and the International Tastings in London. Those initiatives are highly appreciated.

In the second group, there are those who overall enjoy to belong to an active community and to interact with customers (Angels and Archangels), winemakers and NW staff. It’s interesting to quote two answers that - among all - better summarise the enthusiastic motivations: “I like to buy, taste and discuss about wine with like minded people in a friendly and welcoming environment. NW has also allowed me to expand my tastes in wine. I now tend to buy wines based on the opinions of people who I trust (not marketing people)” - “Of being an Angel – being part of something truly different, and having the opportunity to interact with other angels and winemakers. The angel discount obviously is an added bonus! Sometimes, I think they take my opinion of what they should do more seriously than my employers do...”.

Finally, to the third group belong Archangels who particularly appreciate the benefits of having a relationship with winemakers, to get a different understanding of their world and to support producers.
that may not be able to sell in supermarkets. In particular, these Archangels appreciate the opportunity: to choose winemakers to ‘champion’; to commit themselves to make their wines known to Angels; to build up a relationship with the winemaker and - if feasible - to visit the vineyards. One interviewee refers: “Finding people like Carmen Stevens, the first black female winemaker, and seeing her sell her wine within 48 hours is a joy to behold”.

4) What are the responsibilities of being an Angel or Archangel?
The primary responsibility, in both situations, is to commit to regular supplies of money upon which Naked Wines can guarantee associated funding to winemakers. In our survey, other Archangel duties are differently ranked: 13 consider that the main responsibility is to be active on the site, while 4 give priority to the interaction and the promotion of winemakers. Some of them (5) feel also the responsibility to promote Naked Wines and to be their ambassador.

5) What is the relationship between you other customers, winemakers and the company?
Overall, the relationships are deemed very satisfactory. Some of them make friendships during wine tastings events while others have direct contacts with winemakers visiting their vineyards.

6) What would you suggest to Naked Wines to improve in the future?
Overall, Archangels interviewed have shown a strong appreciation for Naked Wines, that has introduced a world-class model for accessing and distributing wines and that excels in customer relationships. The recent new idea - Fine Wine Bond - has been particularly appreciated to meet the demand for more aged wines. They consider the wine reviews fundamental to ensure that a high quality product is always available. They suggest that a strategic focus must be in place to identify new winemakers who are able to supply products even better than the current portfolio. One Archangel suggests that, perhaps, an independent committee (comprising not only Naked Wines staff but also Archangels and external industry experts) should be introduced to ensure a better offering. It is interesting to bring the comment of an Archangel about the criticality related to the growing differentiation of proposed wines. “I am always keen to see the number of new wines on the site grow, but would not want to see that number grow to such an extent that as customer, I struggle to keep up with some of the options. Taking the Laithwaite’s (a British wine e-commerce site) as an example, they currently have 15 different producers of New Zealand Sauvignon Blanc, a style I love. Naked currently stock three producers’ wines, each of which has a distinct character. As there are only three producers to choose from, I can try all of their wines and interact effectively with each winemaker about those wines”. Many Archangels, however, have expressed concerns over the future challenges. Naked has grown so fast that the functionality of the site has to be sorted and requires some upgrades. The website should have to be continually updated to keep pace with what people want from it and that is felt as a bit of a challenge. Some complain that having so many customers could be frustrating for some when a
wine is quickly out of stock. However, they hope that Naked expansion into Australia and more so in the USA will help to solve the stock shortage, and in particular that the Naked winery in Napa will bring some great wines at fair prices in the near future. Moreover, a lot of Archangels emphasize that the model to work it still needs to be somehow small and intimate at the same time. Actually, the problem to solve for NW is how far they can expand without losing the personal touch they have with the customers who want to be involved and feel part of a team. One Archangel suggests that they could include sheries and other fortified wines, liqueurs and perhaps diversify into whisky or brandy, working with small suppliers and giving them a chance to have a relationship with their customers directly.

**DISCUSSION OF RESULTS**

In this paper we investigate Naked Wine experience as a case study to achieve a deeper understanding of an innovative business model where the role of consumers goes beyond the co-creation of value to include financial support to producers. In particular, we address two broad topics: a) how this business model works and the Web 2.0 tools are exploited to support it; b) how and why the Archangels (key actors among NW consumers) are actively involved and become funders and promoters.

Our contribution to the field of social media marketing is the analysis of the consumers’ motivations to participate through social marketing tools to business development, by exploiting an unique data base - gathered by one of the authors during her internship at NW - describing the motivations that led the most proactive consumers in NW network (the Archangels) to take a distinctive role in the development of NW network.

According to our analysis, NW business model has two main distinctive features. First of all, Naked Wine is a case of “double” disintermediation in wine industry. On the one hand, by direct sales, NW cuts out agents and distributors that contribute with, more or less, a margin of 50%, to the final price of a wine bottle. On the other hand, cutting traditional intermediaries, NW exploits the web opportunities for crowd funding to sustain winemakers through a large pool of backers (i.e. angels/archangels), who in exchange get a price discount on their orders. The second distinctive feature is the outstanding use, based on the active participation and involvement of Archangels, of one of the most effective techniques on e-commerce sites to increase the confidence of buyers: the social proof. Findings from our interviews offer some inside on customers’ motivations and commitment. The Archangels, although supporting financially the producers primarily to get a price discount on wine, strongly appreciate the quality of wine, the social aspect of the online community, that allow them to interact with other customers (Angels and Archangels) and NW staff and, last but not least, to interact with winemakers, financially supporting and promoting them. Overall, Archangels interviewed have shown...
a strong appreciation for Naked Wines, that has introduced a world-class model for accessing and distributing wines and that excels in customer relationships. Many Archangels, however, have expressed concerns over the future challenges, emphasizing that the model to work needs to be somehow small and intimate at the same time. Actually, the problem to solve for NW is how far they can expand without losing the personal touch they have with the customers who want to be involved and feel part of a team.

The results of our exploratory research are to be considered as a first step towards a future analysis that could further investigate the opportunities that arise from consumers acting as investors to support producers, that is of particular significance in sectors characterized by the presence of small producers, such as wine and food, where crowd funding can be an important alternative to bank lending and to selling shares in a stock exchange.

COMMUNICATION FOR EDUCATIONAL PURPOSES THROUGHOUT SOCIAL NETWORKS SITES

Viassone, Milena

Department of Management, University of Turin, Italy

ABSTRACT

Nowadays Social Networks Sites (SNSs) are becoming more and more popular in the communication among University students. Even if the last five years have witnessed an increasing interest in their usage, their educational functions are still limited and not developed just like their potential. The aim of this paper is to assess the usage of SNSs for educational purposes and to evaluate the perception of University students towards it. Despite numerous researches have examined SNSs, a few studies have investigated their educational purpose and evaluated the perception of university students for this scope. This paper offers the opportunity to bridge this gap and to address important prospects. The analysis is carried out through the administration of a questionnaire to 125 University students in Northern Italy. In addition to their general information and usage of SNSs for educational aims, they express their perception on the basis of a 5-points Likert scale. Results show how students prevalently use them to interact with their classmates and not with their professors. This is only an explorative study carried out on a sample limited to University students in Northern Italy but it might be useful to develop important paths of development for SNSs.

Keywords: Social Networks Sites (SNSs); University Students Perception; Educational Tools; Facebook; Likert Scale; Interactive Communication.

INTRODUCTION

The ever increasing importance of social networks sites (SNSs) – like Myspace, Facebook, Twitter, etc. - in the communication among University students is particularly due to their interactive and multidimensional features. On the one hand, these tools offer several advantages in terms of saving time, risk and money since they allow for interactivity and cooperation among students as well as students with teachers without meeting in a particular place (Asabere, 2012) while, on the other, they can represent a challenge for students, professors and administrators. Furthermore, they offer several resources and services such as messaging, blogging, group discussion, etc. and students are avid users of these sites (Haneefa and Sumitha, 2011), also because they are user-friendly, student-centered and
student-controlled (Bowers-Cambpell, 2008, p. 82). Despite their increasing attractiveness for University, they are prevalently commercially driven: substantially, they are the result of an adaptation by educators and application builders (Weber, 2012). Moreover, even if they have enormous potential (Madge et al., 2013; Schwartz, 2009) with online courses, their educational functions are still limited and not sufficiently developed. The most researches focus their attention on the real usage of SNSs by students and on their impact on their scholar performances but a few studies have investigated their educational aim (Schwartz, 2009; Selwyn et al, 2008) and almost none of them has evaluated the perception of University students for this specific scope. This paper offers the opportunity to bridge this literature gap and to address important prospects. The purpose of this paper is indeed to assess the usage of social networks for educational aims and to evaluate the perception of University students towards this kind of usage and the relative purpose. This study is focused on the highest education sector, i.e., it is carried out in a University (that of Turin, in Northern Italy) and it is performed through a qualitative investigation involving 125 University students. The first part of the paper is devoted to the definition of SNSs, their educational purpose and attitudes of students towards them; whereas the second one investigates their usage for educational purpose and the relative evaluation of perceptions of University students towards them, by highlighting the main consequences they can provoke on the educational system in order to define a new integrative framework of analysis and development.

**SNSS FOR EDUCATIONAL PURPOSES: A REVIEW OF LITERATURE**

The important topic of SNSs for educational purposes is largely debated in literature and its diffusion is increasing. One out of four highly-educated students in the United States now takes at least one online course during his/her undergraduate career (Allen & Seaman, 2010). As supported by Weber (2012), approximately 75% of all online adults maintain at least one social network profile. SNSs are becoming more and more sophisticated and many operate on a free service model that turns out to be very attractive to educational institutions in developing countries with small education budgets. Karimi and Khodabandelou (2013) support the idea that SNSs such as Facebook have become popular among millions of users including highly-educated students and they have become a significant part of students’ life.

Anyway, researchers seem to have divergent opinions on three fundamental issues like usage of SNSs, their real purpose and perception of SNSs.

With respect to the usage of SNSs, different opinions appear in literature: some researchers support the idea that SNSs could further improve learning and sharing of information among learners and teachers (Ferdig, 2007; Maloney, 2007; Pence, 2007; Simoes and Gouveia, 2008) According to Ellison...
SNSs usage is generally devoted to the management of group projects, the coordination of meetings, chat and message about homeworks, sharing learning experiences and research findings (Hussein et al., 2012); for example, students at the University of North Carolina prefer debating on Facebook versus the standard course management system, listing pre-existing familiarity and user experience as key factors (Stutzman, 2008).

Selwyn (2009, p. 161) shows how students discuss throughout SNSs about five main themes: recounting and reflecting on the University experience, exchange of practical information, exchange of academic information, displays of supplication and/or disengagement and ‘banter’.

Yu et al. (2010) suggested how social networking of University students with peers and professors could be a way for obtaining information, knowledge, social acceptance and support. In the same way, Kosik (2007) noticed that students use Facebook for academic purposes, particularly to connect people and to get information about assignments while Chu and Meulemans (2008) found that SNSs are used in order to communicate with other students about school, instructors and courses. Professors could use Facebook to facilitate instructor-to-student and student-to-student course communication, manage class projects, answer questions, etc. (Abdelraheem, 2013).

On the opposite way, Mazman and Usluel (2010) and Vivian and Barnes (2010) believe that SNSs are used only for informal learning. This opinion is supported by Hamat et al. who, in an important study in 2012, found how the majority of respondents makes use of SNSs to interact and communicate with their peers with the purpose of informal learning.

On the real education purpose and effectiveness of the social networks, there are also controversial opinions. While according to Madge et al. (2009; 2013) SNSs are mainly used both as “a social glue” that helps students familiarize with other students, to deepen the knowledge of their interests, ideas and as a potentially useful tool for promoting effective academic practice, several other researchers are diffident towards the use of SNSs for educational purposes (Kumar, 2010; Kennedy et al., 2008; Oliver and Goerke, 2007; Donnison, 2007). A consistent literature found that University students use SNSs prevalently to communicate with family and friends, to pass time and for entertainment (Sponcil and Gitimu, 2012; Sheldon, 2008) and mainly for social purposes (Boyd and Ellison, 2007; Lampe et al., 2008; Madge et al., 2009). Enriquez (2010) shares the same opinion and declares that “the problem is that most people have Facebook or other social networking sites, their e-mails and maybe instant messaging constantly running in the background while they are carrying out their tasks”.

Additionally, Szwelnik (2008) shows how students express their unease at the idea of their instructors having a presence in what these students consider their ‘private personal space’. On the base of all these considerations, the real effectiveness of SNSs for educational purposes turns out to be uncertain.
This suggests that SNSs have the potential to promote cooperative learning but this must be
developed testing it to University students so to help us in this scope.

With respect to the perception, there is convergence in literature in supporting the idea of a positive
perception of SNSs by students. Someone emphasizes the strict link between SNSs and attitude to
academic life: according to Dorum et al.(2010) SNSs are associated with positive attitudes to academic,
social and personal aspects of students’ life; Irwin et al. (2012) show how students think that a Facebook
page could facilitate their learning, by means of an increased interaction with instructors and
notifications for course information. Furthermore, Keenan and Shirii (2009) explored how SNSs
encourage friendliness through the use of Facebook, Twitter and LinkedIn.

Other researchers associate the use of SNSs with good students’ performances: Mazer et al. (2007)
demonstrate how their usage results in good performances from users in terms of effective learning
which has resulted in a positive learning climate among students. Madge et al. (2009) noticed that 53%
of students who participated in a survey were positive about the use of Facebook for teaching and
learning as long as the focus was on administrative matters.

On the other side, Karl and Peluchette (2011, p. 220) notice a negative perception of SNSs by students,
maintaining how many of them feel uncomfortable to become friends with teachers and how they
aren’t so keen of dealing with teachers for educational purposes because they consider SNSs as a
social space (Madge et al., 2009, pp. 150_151).

METHODOLOGY OF RESEARCH

The present study aims at (1) investigating the usage of SNSs for educational purposes and (2) to
evaluate the perception of University students towards this kind of usage and the relative purpose.
These objectives are achieved throughout the administration of a questionnaire structured in four
main sections to 125 University students: a first part describes general data of university students; the
second one investigates their usage of social networks for educational purposes by means of 7 closed-
reply questions; a third section provides their evaluation in order to draw future strategies - this part
has been obtained throughout a 5-points Likert Scale (1= I completely disagree; 5: I completely agree)
that allows for the evaluation of 17 items structured in 4 main dimensions: learning, commitment/motivation, communication with classmates, communication with professors; finally, the
very last section proposes a balance about the importance of social networks for learning purposes
throughout open questions. The questionnaire has turned out to be a suitable tool for the
measurement of this variable: in fact, it shows a high validity of content and reliability, emphasized by
a high level (0.894) of the Cronbach’s Alpha, that results in a high level of internal consistence of the
scale used with the sample of reference.
SAMPLE

The research involved 125 University students (40% male; 60% female) aged between 18 and 35 (86.4 of whom in the range 21-26 years) recruited between October 2013 and November 2013 in Northern Italy. The choice of exploring only perception of students in this age range is dictated by the fact that this range of population is the one using SNSs most easily and can represent a more and more increasing segment for educational purposes if SNSs is able to satisfy its needs. This number of questionnaires (125) constitutes a representative sample for our exploratory research, which aims at a deep understanding the point of view of University students. The sample is made up of students only (and not by professors or administrators) because we want to understand if these tools could be accepted and considered efficient for this purpose before proposing them to subjects probably more reluctant to use them. The qualitative research based on a structured questionnaire supports the emerging of the real motivations at the basis of the use of SNSs for educational purposes. Respondents are University students involved in a process of learning and with a certain knowledge of these tools.

ANALYSIS AND DISCUSSION OF RESULTS

The first purpose (investigating the usage of SNSs for educational purposes) is based on the frequency analysis of the usage of social networks for educational purposes by University students and results confirm its increasing diffusion (Schwartz, 2009; Selwyn et al., 2008): in fact, most University students (61%) uses SNSs for this purpose almost 1-3 times a week and, in terms of usage, the first place is held by Facebook (87.2%) followed by YouTube (4.8%), MySpace (1.6%) and Skype (1.6%). This large diffusion of SNSs for educational purposes confirms what supported by Weber (2012) who emphasizes their attractiveness for Universities – more and more provided with a small education budget - due to the free service model on which they operate. It is also a confirmation of the thinking by Karimi and Khodabandelou (2013), that consider SNSs an important segment in which to invest in the future.

Despite the several possible usages of SNSs, University students prevalently use them in order to interact with their classmates, i.e., to get help on academic subjects from their classmates (48.4%) and to contact their classmates to arrange for group discussions (23.8%).

This confirms what suggested by Yu et al. (2010) and Kosik (2007) who describe SNSs as a tool used by students especially to obtain information.

With respect to the interaction with other students/professors, SNSs are considered useful to exchange information about the exam rules (36%) and to discuss class assignments (32%). This is reflected in the results of a study by Hussein et al. (2012) who maintain how University students use SNSs for sharing their learning experiences and research findings, getting latest information and developing academic
networks. Similar conclusions are drawn by Kosik (2007) who found how students use Facebook for academic purposes, particularly to connect to people in their classes and to get information about assignments.

University students attribute SNSs the role of facilitator of their learning (Kosik, 2007; Chu and Meulemans, 2008), mostly thanks to participation in general discussions about course topics (38.3%) and throughout an improved interaction with professors and fellow students (21.7%). In particular, messages (39.2%) and comments (17.5%) result the most used functions of SNSs allowing them to interact better with other classmates in order to discuss and share doubts and information. This reflects results obtained by Ellison in his study in 2010 where SNSs usage for educational purposes was mostly devoted to chats and messages related to homeworks.

With regard to the purpose, scarce results are shown with reference to their utility in the interaction with professors: in fact University students found SNSs useful to contact their lecturers “somehow” (35%) or “just a little” (19.2%). This utility turns out to be very or extremely important only in 43.3% of cases and main functions used are messages (39.2%) and chat (30%). This datum confirms the opinion of Karl and Peluchette (2011, p. 220) that found that many students are uncomfortable with becoming friends with teachers or they prefer not to interact with them for educational purposes (Madge et al., 2009, pp. 150-151).

These results are further emphasized with respect to the second investigation: in fact, students expressed a quite negative perception of SNSs for educational purposes, supporting data by Karl and Peluchette (2011, p. 220) who found out that several students felt uncomfortable with becoming friends with teachers: in our study, three dimensions (learning, commitment, communication with professors) out of four show the highest percentages at levels 1, 2 than at levels 4, 5. The highest level of negative perception (levels 1 and 2) is registered by the items “I have a better interaction with my professor throughout social networks” (70.5%) and “Using the social network enhances my interest in the subject” (64.2%). This shows a certain reluctance to use SNSs in order to interact with professors confirming what supported by Meulemans and Chu (2006) in one of their researches. We can notice that most respondents make use of SNSs to interact and communicate with their classmates for the purpose of informal learning: the most positive peak is shown by the item “I can share and solve my doubts throughout social networks” (54.9% at levels 4, 5), confirming results of the study carried out by Mazman and Usluel (2010), Vivian and Barnes (2010) and Hussain et al. (2012). The single item which doesn’t collect positive results with respect to communication with classmates is “Social networks increase my creativity and interactivity with the class”. These results show how students accept to use SNSs for educational purposes only in the communication with their peers who are
considered as a part of their social circle while they exclude professors/lecturers from it, confirming results of previous researches (Hamat et al., 2012).

Source: personal elaboration.
Finally, a certain attitude towards SNSs for educational purposes is only expressed with regard to the interaction with their classmates and only limited to particular aims like discussion, exchange of information and cooperation. These results show how SNSs for educational purposes are in a first stage in Italian University and how many efforts should be carried out in order to develop these interesting tools.

**CONCLUSIVE REMARKS**

Results show an increasing usage of SNSs by young people (Karimi and Khodabandelou, 2013) who can constitute an important segment to invest in the future but only for peculiar services and functions they are available to accept. In fact, despite SNSs could have a bright future also in the educational field with regard to the interactivity and exchange of information among classmates, their acceptance in the dialogue students-professors is not so consolidated both by students and professors. University students who adopt SNSs for educational scopes consider their utility in order to share information, doubts, etc. overall but they don’t consider them as tools capable of easing their learning and their preparation for the exams. This is related to fact that they think professors are not so ready and available to use them for learning purposes.

These data support completely what maintained by Karl and Peluchette (2011, p. 220) who suggested a certain uncomfortableness by students with becoming friends and by (Madge et al., 2009, pp. 150_151) who found out that students were not very keen to interact with teachers and considered SNSs as a social space.

However, SNSs are well used by University students and may be excellent tools to be integrated into the learning resources of university courses. Results from this study indicate that students are receptive to incorporating SNSs (in particular Facebook) into their academic lives and think they could enhance communication and interaction with their peers (Irwin et al., 2012). In order to develop the use of these tools, in the future it will be necessary to pull down important barriers like the scarce attitude towards their usage by professors/lecturers. In fact, they could really facilitate in the dialogue with lecturers easing their preparation and improving learning at 360° as supported by several authors (Ferdig, 2007; Maloney, 2007; Pence, 2007; Simoes and Gouveia, 2008).

This not-so-positive perception of University students towards SNSs for educational purpose with respect to the three dimensions (learning, commitment, communication with professors) should be viewed as an incentive to deeply understand their motivations and correct possible erroneous scruples they have towards their usage for communicating with professors.

This paper opens possible future implications and developments: first results of this paper should push professors to improve the usage of SNSs - with lectures on YouTube, creation of groups on
Facebook, upload of the videos of lectures, the creation of exercises to solve in groups via SNSs - in order to develop the dialogue with their students. This purposeful behavior by students should be viewed as an encouraging sign to continue on this path, providing always new innovations able to meet or to anticipate their future needs. Furthermore, also the development of appropriate learning strategies in order to encourage newcoming university students to use technology for learning opportunities should be considered (Ellis and Newton, 2009).

At the same time, given the important potential that these tools could have for educational purposes in the future, if these barriers were to be pulled down, teachers should be adequately provided with the time to deal with this level of learning support (Van Doorn and Eklund, 2013). Furthermore, in order to encourage the usage of SNSs by students, important efforts should be carried out in order to improve their security and privacy and protect the misuse of copyrighted materials (Haneefa and Sumitha, 2011).

Finally it has been demonstrated that the mistrust of SNSs has also led to the fact that many teachers have the same feeling of rejection towards technology used by students because in their opinion it interferes with the natural flow of traditional education (Handely 2007). So, whether or not the ways of working, doing research and learning remain on the sidelines of this revolution is up to teachers and the attitudes of students (Vidal et al., 2011).

Although this research offers important suggestions and enrich existent literature on this topic, there are some limitations which should be taken into account. First of all, this research is an exploratory study based on a limited size sample and it finds application only in Northern Italy. In the future, it is possible to further develop this research by extending the same study to professors and analyzing, on a wider sample, the motivations that prevent students or professors from adopting SNSs for educational purposes in order to develop future strategies.

INNOVATION IN EXPORT MARKETS: A DYNAMIC CAPABILITY VIEW

Vicente, Margarida1; Abrantes, José1; Teixeira, Mário1; Rubio, Isabel3; Seabra, Cláudia1

1Instituto Politécnico de Viseu, Portugal  
2Universidade de Trás-os-Montes e Alto Douro, Vila Real, Portugal  
3Universidad de Salamanca, Salamanca, Spain

ABSTRACT

This paper analyzes the influence of technological turbulence, organizational management dynamic capability and operational capabilities for innovation on export market effectiveness. Based on the dynamic capability view, we investigate the effect of technological turbulence on organizational management dynamic capability, and how this latter contributes to leverage operational capabilities for innovation in order to benefit performance in export markets. To test the hypotheses, we carry out a structural equation model, using a sample of 471 exporting manufacturers firms that operate from Portugal. The results demonstrate that technological turbulence is an antecedent factor of organizational management dynamic capability, which in turn has a significant impact on the development of firms’ operational capabilities for innovation, specifically innovativeness, innovation strategy, and technological capability. However, the findings only establish that innovation strategy and technological capability have a significant direct effect on export market effectiveness. Implications for scholars and practitioners are discussed along with suggestions for future research.

Keywords: Dynamic capability; Innovation; Export market effectiveness.

INTRODUCTION

It is necessary to research more deeply the relationship between dynamic capabilities, innovation, and firms’ export market effectiveness (Weerawardena and Mavondo, 2011). As the export environment becomes more dynamic and uncertain, the need to continuously adapt and innovate becomes imperative for the success of industrial firms (Tomiura, 2007, Yam et al., 2004). Innovation is the key strategic tool to improve market position in such complex environment (Chadha, 2009, Lisboa et al., 2011).

The dynamic capability view suggests that, in order to outperform competitors and ensure continuous innovation, firms must possess dynamic capabilities (e.g., Eisenhardt and Martin, 2000, Teece et al., 1997). They allow firms to upgrade or reconfigure operational capabilities (Helfat and Peteraf, 2003, Hill and Rothaermel, 2003, Zahra et al., 2006) in order to address rapid changes in business
environment (Teece et al., 1997). Competitive advantage results not from dynamic capabilities by themselves, but from the configuration of operational capabilities they create (Eisenhardt and Martin, 2000, Helfat and Peteraf, 2003, Makadok, 2001, Zollo and Winter, 2002).

Due to emerging technologies, fast changes in customer needs, and accelerated competition, deploying and understanding dynamic capabilities is important for innovation and export contexts (Danneels, 2002, Gebauer, 2011, Teece, 2007, Winter, 2003). Dynamic capabilities require the creation and assimilation of firms continuous innovation in order to respond to the customer needs and technological opportunities (Teece, 2007). Innovation involves a continuous search for new knowledge that goes beyond the existing knowledge associated with firms’ current operational activities (March, 1991).

Dynamic capabilities are an evolving concept (Newbert, 2007, Rindova and Kotha, 2001), which has to be studied as an integrated model that establishes the connection between its antecedents and its effects (Hung et al., 2010, Wang and Ahmed, 2007). Investigation in this field focuses particularly on conceptual analyses, while empirical studies are still quite sparse (Cepeda and Vera, 2007, Helfat and Peteraf, 2009). In addition, limited research exists about how dynamic capabilities are created, and how they interplay with operational capabilities in order to generate firms’ superior value (Weerawardena and Mavondo, 2011, Winter, 2003, Zahra et al., 2006).

Highlighting these gaps in the literature, we develop an approach that bridges dynamic capabilities, operational capabilities for innovation, and performance in export markets. We seek to contribute toward emerging the dynamic capability view, focusing on identifying the components of dynamic capabilities and operational capabilities for innovation, relevant to export market effectiveness.

The article is organized as follows. The next section offers the theoretical foundation and the conceptual framework. Then, we describe the empirical procedures and present the results. Finally, we discuss the most important conclusions, implications and limitations of the findings.

THEORETICAL BACKGROUND AND HYPOTHESES
Innovation capabilities, such as innovativeness, innovation strategy and technological capability are critical for the success of manufacturing firms (Terziovski, 2010, Yam et al., 2010, Yam et al., 2011). They are a kind of special assets that include technology, processes, knowledge, experience and organization (Guan et al., 2006). Innovativeness, innovation strategy and technological capability are related with firm’s operational functions, and so they are operational capabilities for innovation (cf., Cepeda and Vera, 2007), that can be further subdivided into specific skills or competences.

Considering that export market and innovation represent a high degree of uncertainty and change, dynamic capabilities are critical for innovation in the export context (e.g., Lee and Kelley, 2008, Lisboa...
et al., 2011). Dynamic capabilities enable firms to keep strong and flexible operational capabilities for innovation (Wang and Ahmed, 2007, Zahra et al., 2006). The improvement of operational capabilities to respond to market changes benefits the way firms operate, and help managers to realize how these improvements can be valuable (Cepeda and Vera, 2007).

One important component of dynamic capabilities is organizational management capability (Hung et al., 2010). Organizational management dynamic capability allows to develop operational capabilities (Helfat and Peteraf, 2003, Zahra et al., 2006) through the flexibility and the alignment of internal capabilities with external demand (Álvarez and Merino, 2003, Camuffo and Volpato, 1996). It focuses on improving existing operational capabilities in order to meet customer needs and finally to enhance performance (Helfat and Peteraf, 2003).

In this study, we intend to demonstrate that organizational management dynamic capability is a response to technological turbulence and that it has a significant impact on operational capabilities on innovation (i.e., innovativeness, innovation strategy and technological capability), which, in turn, contribute to superior export market effectiveness. The conceptual model is presented in Fig. 1.

Fig. 1. Hypothesized relationships.

Technological turbulence and organizational management dynamic capability

Technological turbulence refers to the extension of technological advances in the industry (Kaleka, 2012). The more dynamic and hostile an environment, the greater the probability of firms to demonstrate organizational management dynamic capability in order to adapt to technological turbulence (Teece, 2007, Wang and Ahmed, 2007).

Hypothesis 1. Technological turbulence positively influences organizational management dynamic capability.

Organizational management dynamic capability and innovativeness

Organizational management dynamic capability keep managers and work teams informed about markets and technologies changes (Camuffo and Volpato, 1996, Teece, 2007). The unexpected situations in the environment, such as customer needs unfilled, or changes in market trends, stimulate
a firm's culture of continuous experimentation of new ideas and procedures (Eisenhardt and Martin, 2000, Jong and Hartog, 2007, Zahra et al., 2006). In addition, the organizational management dynamic capability promotes the knowledge sharing and cooperation between work teams, which leads to synergistic benefits by solving problems that combine this knowledge in innovative ways (Bierly III and Chakrabarti, 1996, Brown and Duguid, 1991). In order to provide solutions to business challenges and problems, managers change routines and develop a culture of innovativeness that is shape to accept high levels of internal change (Teece, 2007, Teece et al., 1997).

Organizational management dynamic capability leads firms to frequently try out new ideas, new ways to do things, and to be creative in their methods of operation, contributing for the development of innovativeness (Figueiredo, 2003, Teece, 2007).

Hypothesis 2. Organizational management dynamic capability positively influences innovativeness.

Organizational management dynamic capability and innovation strategy

Innovation strategy requires firms to focus not only on internal resources and capabilities but also on external links to the market (Grant, 1991, Poon and MacPherson, 2005). The assessment of external factors must precede the formulation of objectives and competitive methods for innovation (Dess, 1987, Khandwalla, 1976). Organizational management dynamic capability, by continually focus on markets and their constantly changes, enable firms to develop the most suitable innovation strategy (Poon and MacPherson, 2005).

Moreover, the implementation of innovation strategy depends on the extent to which different functional departments share and combine resources for realizing such strategy (Tsai and Ghoshal, 1998, Van de Ven, 1986). The interaction between the various functional departments implies to cultivate good working relationships, and accommodate multiple and sometimes even conflicting viewpoints (Cheng et al., 2010, Clercq et al., 2008, Luca and Atuahene-Gima, 2007). Organizational management dynamic capability promotes the communication, coordination, knowledge sharing, and exchange between different functional departments, and thus decrease the risk of potential conflicts (Gatignon and Xuereb, 1997, Xie et al., 1998). Hence, firms with organizational management dynamic capability are better prepared to implement and adopt tools and techniques related to innovation strategy (Nijssen and Franschke, 2000).

Hypothesis 3. Organizational management dynamic capability positively influences innovation strategy.

Organizational management dynamic capability and technological capability

A central component of technological capability is Research and Development (R&D) activities (e.g., Kyläheiko et al., 2011, Roper and Love, 2002, Zahra, 1996). R&D is the most important intangible expenditure in innovation (Evangelista et al., 1997). Technological capability, such as extensive R&D
activities and projects, represent the investment in the creation of technological knowledge that leads to improvement and successful innovation (e.g., Renko et al., 2009, Wang and Kafouros, 2009, Yam et al., 2010, Yam et al., 2011, Zhou and Wu, 2010).

Organizational management dynamic capability takes a critical role in the development and accumulation of technological capability (e.g., Figueiredo, 2003, Wang and Ahmed, 2007). This dynamic capability promotes the intra-firm knowledge dissemination, and ensures the creation of new technological knowledge through the continuous interaction of several functional viewpoints and interests (Figueiredo, 2003, Zhou and Wu, 2010). In addition, it stimulates employees’ active involvement in internal activities, which leads them to understand the principles underlying the technology and to move on to new actions in response to future market changes (Figueiredo, 2003, Sanchez, 1995). Hence, organizational management dynamic capability leads firms to invest heavily in certain R&D projects, to use the long term know-how in such projects, and to develop superior technological capabilities (Bierly III and Chakrabarti, 1996).

Hypothesis 4. Organizational management dynamic capability positively influences technological capability.

Innovativeness and export market effectiveness

Innovativeness is an important determinant of various performance outcomes, including market position (e.g., Hult et al., 2004, Rhee et al., 2010), financial position (e.g., Calantone et al., 2002), and firm value in the stock market (e.g., Rubera and Kirca, 2012). Firms with a higher culture of innovativeness develop a superior competitive advantage (Hult and Ketchen, 2001), which enable them to reinforce outcomes from it (Damanpour, 1991, Hurley and Hult, 1998). Hence, innovativeness is likely to result in superior export market effectiveness (e.g., Calantone et al., 2002, Hult et al., 2004, Rhee et al., 2010).

Hypothesis 5. Innovativeness positively influences export market effectiveness.

Innovation strategy and export market effectiveness

Prior studies have demonstrated that innovation strategy has a great influence in growth and organizational performance of manufacturing firms (e.g., O’Regan et al., 2006, Poon and MacPherson, 2005, Terziovski, 2010). Innovation strategy strengthens behaviors and promotes internal cooperation in the development of innovative activities that, in turn, allow firms to increase their performance (e.g., Akman and Yilmaz, 2008, Hart, 1992). Firms create innovative products that stimulate customers and outperform competitors, expand their existing markets or create new ones, and achieve distinctive market positions (He and Wong, 2004, Lawson and Samson, 2001). Hence, innovation strategy is expected to enhance export market effectiveness.

Hypothesis 6. Innovation strategy positively influences export market effectiveness.
Technological capability and export market effectiveness

Technological capability represents the firms’ internal effort to create a stock of scientific and technical knowledge (Kyläheiko et al., 2011, McEvily et al., 2004, Quintana-García and Benavides-Velasco, 2008), that leads to more efficient processes for developing and testing new products and ideas (Criscuolo et al., 2010). Firms with superior technological capability are more innovative (e.g., Martínez-Román et al., 2011), and have a bigger performance (e.g., Coombs and Bierly, 2006, Ortega, 2010). Technological capability allows firms to develop and introduce new products in the market (Renko et al., 2009), create differentiated and high quality products (Yam et al., 2010), and have more competitive prices by reducing production cost (Kafouros et al., 2008, Yam et al., 2010). Hence, technological capability improves competitiveness and leads to superior export market effectiveness (Yam et al., 2004).

Hypothesis 7. Technological capability positively influences export market effectiveness.

METHODOLOGY

This study was conducted in 2012, using a sample of Portuguese exporting manufacturers. An online questionnaire was the basis of the data used to test the model. The final sample size was 2740 firms. We obtained 471 valid questionnaires, which corresponds to a response rate of 17%. This is a very satisfactory response rate, given that the average top management survey response rates is in the range of 15% to 20% (Menon et al., 1996). Our model includes 35 observable indicators, which determines a 13:1 ratio of sample size to number of free parameters (see Bentler, 1989 in Westland, 2010).

RESULTS

In this model, each item was restricted to load on its priori specified factor, with the factors themselves allowed to correlate with one another. The overall chi-square for this model is significant ($\chi^2=286.41$, df=137, p<0.00). Four measures of fit were examined: the comparative fit index (CFI=0.98), the incremental fit index (IFI=0.98), the Tucker-Lewis fit index (TLI=0.97) and the root mean square error of approximation (RMSEA=0.048). The results suggest that the scale measures were internally consistent, able to provide a good fit of the factor model to the data.

The conceptual framework depicted in Fig. 1 was tested using structural equation modeling. The results suggest a good fit of the model to the data ($\chi^2=429.97$, df=145, p<0.00, $\chi^2$/df=2.97, CFI=0.96, IFI=0.96, TLI=0.96, RMSEA=0.065).

Consistent with H1, technological turbulence positively influences organizational management dynamic capability ($\beta=0.41$, t-value=6.78). In line with H2, H3 and H4, organizational management dynamic capability has a significant positive impact on innovativeness ($\beta=0.66$, t-value=9.18).
innovation strategy ($\beta=0.72$, t-value=9.21), and technological capability ($\beta=0.66$, t-value=9.27). Contrary to expectations, no significant association is found between innovativeness and export market effectiveness ($\beta=0.04$, n.s.), thus H5 is rejected. Finally, consistent with H6 and H7, innovation strategy and technological capability have a significant positive impact on export market effectiveness ($\beta=0.18$, t-value=2.66 and $\beta=0.17$, t-value=2.63, respectively).

DISCUSSION AND IMPLICATIONS

This article advances understanding on dynamic capabilities, specifically organizational management dynamic capability, and operational capabilities for innovation, namely innovativeness, innovation strategy and technological capability, and their impact on export market effectiveness, through the application of the dynamic capability view in the export context. In this sense, we clarify the nature of organizational management dynamic capability, by explaining its measures, antecedent and effects. We empirical test innovativeness, innovation strategy and technological capability as the output of organizational management dynamic capability, and the indirect impact of organizational management dynamic capability on export market effectiveness.

Taking into account that nowadays industrial exporting firms face a constantly changing environment, characterized by high technological turbulence, the results highlight the need for managers to cultivate organizational management dynamic capability in order to respond to rapid changes in technology. Managers’ examination of technological breakthroughs in the industry influences the development of the necessary flexibility to coordinate and improve operational capabilities for innovation, and to align internal capabilities with customers’ needs. This way, firms are able to articulate more and upgrade innovativeness, innovation strategy and technological capability.

The study highlights the importance of firms’ organizational management dynamic capability in the export context, with an environment open to global competition and characterized by rapid technological changes. Organizational management capability is a dynamic capability that enables firms to respond to technological turbulence while developing the flexibility required for upgrading operational capabilities in order to meet the customers’ needs.

This study takes the position that innovation strategy and technological capability are key operational capabilities for achieve a superior performance in export market. When managers develop innovation strategy and technological capability to enhance market performance effectively, they should also develop organizational management dynamic capability in order to improve them. Firms should look for synergies between organizational management dynamic capability and innovation strategy as well as technological capability in order to survive and grow in export markets.
LIMITATIONS AND DIRECTIONS FOR FUTURE RESEARCH
This study presents some suggestions for future research regarding the theoretical and methodological limitations.

We conceptualized organizational management dynamic capability using three measurement items. Other elements of organizational management dynamic capability could exist and be measure. Research may continue by consulting other scholars’ interpretations of dynamic capabilities and/or by using a multidimensional construct of dynamic capabilities. Moreover, it is probable that different industries have different dynamic capabilities. This is also a subject that worth further investigation.

Future research may consider other types of operational capabilities for innovation, such as manufacturing, learning, and resources allocation capabilities, among others. It would be also interesting to analyze the impact of organizational management dynamic capability on these other capabilities.

Longitudinal data may improve this type of investigation, analyzing how organizational management dynamic capability can improve operational capabilities for innovation over time. Because the firm’s environment is constantly changing, it is important that future research assess the extent and speed of change that organizational management dynamic capability enables. The cross-sectional data used in this study may not be adequate to observe the short and long-term impact of organizational management dynamic capability on operational capabilities for innovation.

Future studies are encouraged based on samples from various countries, since we only used firms based in Portugal. However, investigation that examines dynamic capabilities in the exporting field was developed with single-country samples (e.g., Chadha, 2009, Lisboa et al., 2011).

ACKNOWLEDGMENTS
This research was supported by Portuguese Foundation for Science and Technology (FCT) through the project PEst-OE/CED/UI4016/2014, and Center for Studies in Education, Technologies and Health (CI&DETS).

ASSSESSMENT OF THE BRAIN REACTIONS TO SOUND AND PICTURE IN ADVERTISING

Vidigal Costa, João; Lucas de Freitas, Carlos; Paiva, Teresa

1Centro de Estudos de Gestão, Instituto Superior Tecnico, Universidade de Lisboa, CEG-IST, Portugal
2Centro de Electroencefalografia e Neurofisiologia Clínica, CENC, Lisbon, Portugal

ABSTRACT

In this exploratory research, the main objective was to study the influence of sound and picture in advertising, by observing the neural responses of subjects from both genders. The EEG was recorded for 11 female and 11 male participants, during the presentation of 2 television ads.

A local frequency analysis pointed key moments of the ad. Also, a sLORETA analysis showed that during the first second, one of the ads triggered greater neural activation than the other, for both genders, especially in areas related with visual and auditory integration, as well as specific decision-related structures.

It was concluded that sound and picture amplify each other’s effects in advertising. Also, a local frequency and a sLORETA analysis can successfully point to effective moments of a marketing campaign.

Keywords: Neuromarketing, EEG, TV advertisement, Wavelet Transform and sLORETA

INTRODUCTION

Neuromarketing is an emergent field, which consists in “looking at consumer behavior from a brain perspective” (Morin, 2011). Basically, Neuromarketing is the combination, as the name implies, of Neurosciences and Marketing, providing to the second the powerful machinery and insights from the first.

A number of marketing agencies have since started using neuroimaging tools, to better understand the commercial problems of their clients. Most scientific works establish the definition of neuromarketing, as “a field of study concerning the application of neuroscience methods to analyze and understand human behavior related to markets and marketing exchanges” (Babiloni, 2012).

Neuromarketing is able to provide directly obtained information, about the neural reactions of individuals (Lee et al., 2007). It can even be suitable to judge a product before it even exists, as its fast execution could mean that a concept was swiftly tested, and if the results didn’t meet the standards,
Numerous techniques, used in a neuroscientific context, can be transported for neuromarketing, like electroencephalography (EEG), functional magnetic resonance imaging (fMRI), facial electromyography (EMG) or the measuring of the galvanic skin response (Hess, 2009; Mendes, 2009).

One of the most important analysis of the EEG is that of the waveform. From a waveform perspective, an assessment is made on the basis of grouping the different components, according to the frequency interval to which they belong. So, there are five main brain wave patterns: alpha, beta, delta, theta and gamma.

Alpha waves are generally found in the EEG’s of most adults, when they are awake and in a quiet, resting state of thinking. Beta waves may replace alpha waves, in a case of a subject’s attention being directed to a specific type of mental activity. Theta and Gamma waves play an important role in memory activation. Theta waves also play a role in emotional processing and gamma waves in attention. Delta waves are characteristic of specific sleep stages (Guyton & Hall, 2006).

To make a thorough frequency analysis, the Wavelet Transform was used. The Wavelet Transform gives a local frequency analysis of non-stationary signals (like EEG) over a time interval, decomposing the signal from the time domain to a time-frequency domain. This means that with this method, one can know the evolution of each desired frequency over time.

For a better mapping of the brain activity, a software package (sLORETA) was used. The sLORETA (Standardized Low Resolution Electromagnetic Tomography) software allows a good approximation for the solution of the inverse problem of EEG, that is, to determine the localization of the neuronal generators of the EEG responses. Since brain activity is spatially distributed, and therefore is not simply originated by single point sources, this is a better solution than, for instance, dipole fitting (Pascual-Marqui, 1999), and it depicts these phenomena with the lowest localization error from all the 3D localization methods (Pascual-Marqui, 2002), and a 5 mm spatial resolution (Fuchs et al., 2002; Pascual-Marqui, 2002), which is close to what some fMRI systems are able to offer (fMRI’s strongest point is usually the good spatial resolution).

In this research, the focus was on studying the reaction to different TV ads from the same brand and product. EEG will be used to acquire the reactions of the participants, which will be analyzed to better understand factors like feelings, levels of attention and arousal. It will be complemented with a standard consumer questionnaire. The main aims were:

- Verify if a simple experimental paradigm, with only target stimuli, can be reliable for a neuromarketing analysis;
- Attest if neural responses can point to key moments of an ad. If so, recognize when those occur;
• Identify what structures show the most significant differences between different ads;
• Observe the importance of sound in the context of advertisement;
• Analyze the usefulness of methods, like the Wavelet Transform and sLORETA, in Neuromarketing studies.

METHOD

Participants
The sample was comprised of 22 subjects (50 % of each gender). All the subjects were right-handed, had normal or corrected vision, and had no diagnosed neurological issues. All the subjects were Caucasian, had the same nationality, and were all young adults with ages between 22 and 28 years old. The sample was selected by convenience, and is comprised of family members, friends and colleagues.

Paradigm
The paradigm of this experiment consisted in the showing of two different TV commercials, under four conditions: audiovisual form (Sound & Picture), with Sound Only, with Picture Only and with the Sound Swapped. Each stimulus was shown six times.
The two commercials advertised the same product, a women’s perfume called J’adore, produced by Dior (Figure 1). Both ads star Charlize Theron, a famous actress.
The paradigm was structured in E-Prime®.

Figure 2. Image of the protagonist during the first commercial and second commercial, respectively.

Questionnaire
A questionnaire was applied immediately after the experiment, to complement the Neuromarketing data. It assessed participant information, brand and product opinion, opinion on the first ad and opinion on the second ad, and was designed with Qualtrics®.
Using ANOVA and Kruskal-Wallis, the responses of both genders were compared, to observe if there were significant differences, with $\alpha = 0.05$.

Repeated measures ANOVA and Friedman tests were computed to verify any significant differences between the two ads, again with $\alpha = 0.05$.

**Equipment**

The amplifier used for all the acquisitions, was a BrainVision® QuickAmp 72, which allowed the amplification of the very small currents obtained through the EEG system. The sampling rate used for all the acquisitions was 2000 Hz, to prevent aliasing.

The electrode cap used here follows the 10-10 system, with 63 Ag/AgCl electrodes and is made of a spandex-like material. An additional pair of electrodes was used to obtain the vertical components of eye movements, to remove those artifacts.

![Electrode Placement](image)

**Figure 3.** On the left, a schematic of the electrode placement used in a 10-10 system is presented. On the right, the picture presents an example of a similar system.

**Signal processing**

A wavelet transform was obtained for each stimuli. This resulted in the normalized powers of the theta, alpha, beta and gamma bands, over time, from each repetition of the stimuli. The averaged EEG data of each subject was obtained and exported, for use in sLORETA. The frequency data was grand-averaged across subjects.

The sLORETA data was used for t-tests over time ($\alpha=0.05$), to detect moments where there were significant differences between stimuli, and then their LORETA transformed data was tested, to compare the average neural activity in those intervals.
RESULTS

Questionnaire results
Most of the ad based questions didn’t present significant differences between genders. The question about whether the protagonist was well known, was the only exception, and shown that for both ads, females remembered her the most.

In the case of brand and product based questions, the results show a greater experience with Dior products in general, and J’adore in particular, from women, as well as a greater desire to acquire and use them in the future, and a higher interest in this kind of product altogether, which, given the nature of the product, was to be expected.

There was only one item where differences were significant: the song of the second ad was better known from outside of the context of the commercial, than the song of the first ad. Also, the standard deviations and means, for the question about the possible improvement of the opinion on the product, were exactly the same.

Time-frequency results
A strong bilateral theta activation occurred, over the anterior region of the frontal cortex, for almost the whole duration of the ads. When the sounds of both ads were changed, both presented very similar patterns of activation, however they presented less medial prefrontal theta activity than their original counterparts. Still, these theta peaks covered a good portion of the commercial. Figures 2 and 3 present two examples of the results obtained in this analysis, over the frontal region of the brain.

Figure 4. Grand averaged power spectrum of the 22 participants, for the whole duration of the first ad, when sound and picture were presented. The x-axis represents time (0 to 28 seconds), the y-axis represents the frequency domain (4 to 60 Hz) and the colors represent the spectral power (-0.25 to 0.50 µV²).
In both Sound Swapped stimuli, frontotemporal theta peaks were observed. For instance, there are two clear theta frontotemporal synchronizations, for the first ad, that come right around the same time as two lines of the monologue, that in this case cannot be heard ("Gold is Cold" and "Don’t Pretend"). There are similar peaks in the Sound Only condition of the same commercial over the 6th, 12th and 13th seconds, which actually are right around the time of the first and third lines of monologue.

In the first ad, the Picture Only present right temporoparietal peaks, very close to three key visual moments of the ad, where a close up to the actress is shown: first, the moment when she takes the net off her hair; second, when she starts taking off her bracelets and finally, when she starts unzipping her dress.

Several theta occipital peaks were elicited for the multiple conditions, including those with no picture or no sound. The Sound Swapped conditions and Picture Only condition, for the first ad, did not generate these spikes.

The two conditions that held more constant alpha activity, especially over anterior frontal regions and the occipital cortex, were the two Sound Only conditions. The first commercial presented considerably more alpha synchronizations than the second one, for the whole set of conditions. Yet, in most moments that alpha oscillations have a power increase, it was most often followed by a decrease and increase in beta activity.

For the first ad, all the conditions present increased alpha activity after the 20th second. In the case of the first condition for this ad, this happened systematically until the end of that stimulus, while for the two remaining conditions, containing picture, that was not as significant, but still, some beta activity spikes followed alpha synchronizations/desynchronizations. A beta peak occurred around the 23rd second, another at the 24th second when the perfume is shown and another at the 27th second, when
the brand name is shown and also mentioned by Theron. Also in the Picture & Sound condition, the other main peaks seemed to be around the time that Theron takes off her necklace and when she took off her bracelets.

Still, the biggest difference between that first condition and the other two that showed picture for the first ad, was that they show more alpha synchronizations/ desynchronizations, coupled with beta synchronizations right up to the 8th second.

The Picture Only condition presented more beta synchronizations than any other for the same ad. Almost all of the beta synchronizations that occur in this condition have also been observed in either one, or both the Sound & Picture and Sound Swapped conditions.

Only the Sound Swapped condition showed increased beta activity for the first 4 s of the second ad. For this condition, there were also beta peaks around the time that Theron is shown again, this time getting dressed, and from the moment she enters the catwalk, up to when she is filmed from behind. Finally, there were other beta synchronizations when the bottle of J’adore is shown, when its name appears and when the Dior name appears.

For the Sound & Picture condition of the same ad, the key beta peaks occurred for the close-up to Grace Kelly, the first moment where Marilyn Monroe is shown, in which she mentions the brand name, when Charlize Theron enters the catwalk (where the Dior name was strategically in the background), when the bottle of the perfume appears and finally when its name fades into the screen.

Most gamma peaks over the prefrontal cortex, occurred around the same time as beta peaks. The only exceptions happened in the Sound & Picture condition of the first advertisement, around the 17th second, right after one of the lines of the monologue (“Feel what’s real”), and on the 3rd second of the second ad, for the same condition. The Sound Only condition of the first ad elicited an exceptionally high amount of synchronizations in this frequency band, over the temporal lobe, for the first half of the commercial.

sLORETA

The interval from 663 ms to 694.5 was observed to be the time in which larger differences occurred between the first and second ads, in their first second, for female subjects. Then, a t-test with spatial localization was performed over that interval, in which the following regions were identified as having differences of the type A(Ad2)>B(Ad1):

**Left Hemisphere:** Medial Frontal Gyrus Brodmann Area (BA) 6;
**Right Hemisphere:** Precentral Gyrus (BA 4, 6, 43, 44), Inferior Frontal Gyrus (BA 44, 45, 47), Insula (BA 13), Superior Temporal Gyrus, (BA 13, 21, 22, 38), Fusiform Gyrus (BA 20), Inferior Temporal Gyrus (BA 20, 21), Temporal Lobe Sub-Gyral (BA 21) and Middle Temporal Gyrus (BA 21, 22).

There were also differences of the opposite type, in the Middle Occipital Gyrus (BA 19).
Figure 6. 3D mapping of the significant differences between the two ads, for the 11 female subjects. Yellow and red represent differences of A > B type, and blue of the B > A type.

In the case of men, the interval between 538.5 ms and 572.5 ms was where the most significant differences were found in the first second. All differences were of the type \( A(Ad2) > B(Ad1) \), and occurred in the following regions:

**Left Hemisphere:** Superior Frontal Gyrus (BA 8), Middle Frontal Gyrus (BA 8), Posterior Cingulate Gyrus (BA 30), Limbic Lobe Sub-Gyrus (BA 31), Precuneus (BA 7, 19, 31), Superior Temporal Gyrus (BA 21, 22, 42), Middle Temporal Gyrus (BA 21), Transverse Temporal Gyrus (BA 42) and Cuneus (BA 7, 19, 30);

**Right Hemisphere:** Cingulate Gyrus (BA 31), Precuneus (BA 7, 19, 31), Supramarginal Gyrus (BA 40), Superior Temporal Gyrus (BA 22, 39), Middle Temporal Gyrus (BA 39), Cuneus (BA 7), Precuneus (BA 31) and Middle Occipital Gyrus (BA 19).

Figure 7. 3D mapping of the significant differences between the two ads, for the 11 male subjects. Yellow and red represent differences of A > B type.
DISCUSSION

In terms of frequency analysis, Sammler et al. (2007) argued that pleasant music generated increased theta activity, over the frontal midline, which was observed, as there was a strong activation over the anterior region of the frontal cortex, for almost the whole duration of the ads, except for the two muted videos. These have been linked to emotional processing. The frontotemporal theta peaks, found in both Sound Swapped videos, were originated from the perception of portions of their sound as deviant (Choi et al., 2013). Moreover, the right temporoparietal theta peaks were generated by visual memory encoding processes. Bilateral activations of this kind were due to retrieval (Sauseng et al., 2004). Numerous occipital theta peaks, elicited for the multiple conditions, occurred due to episodic memory retrieval (Lee et al., 2010).

The constantly large alpha activity in both Sound Only stimuli occurred because of the lack of visual input (Toscani et al., 2010). Some subjects actually reported after the end of the experimental procedure, that they had closed their eyes during these. As was verified in this study multiple times, alpha synchronizations and desynchronizations have been seen to work as an anticipatory response, when followed by beta activity peaks (Babiloni et al., 2006). Besides, the beta rhythm is a mark of increased processing by cortical structures, and so, a good indicator of attention.

Finally, the gamma band plays a role in attention and memory (Jensen et al., 2007). The gamma synchronization in the prefrontal region, which occurred at the 3rd second of the second ad, was probably due to the opening notes of the song that accompanies the ad, and the image of the protagonist entering the dressing room. Also, the multiple temporal peaks in this band, for the Sound Only condition of the first ad, point to an increase in auditory perception (Crone et al., 2001).

With the sLORETA analysis, it was seen that men and women had inverse reactions to both ads in the middle occipital gyrus, which were related with differences of spatial attention (Mangun et al., 1998). Females had higher levels of spatial attention for the first ad, probably because of visual elements like the protagonist’s dress, while males were more focused on the second one. The right inferior frontal gyrus is stimulated when important attentional elements are perceived (Hampshire et al., 2010), and the left medial frontal gyrus is connected with approach behavior (Talati & Hirsch, 2005). On the other hand, the right fusiform gyrus and inferior temporal gyrus, which were more active in the second ad for females, are structures involved in face processing (Gross, 2008; Rossion et al., 2012). This was perhaps caused by the faces of photographers shown in the beginning of the stimulus. Both genders had increased processing in the superior and middle temporal gyrus, in areas that play important roles in musical processing and voice recognition, caused by prior memories of the song of the commercial, also verified in the questionnaires. Men, also, presented increased activation of the transverse temporal gyrus (BA 42), which is an area of auditory integration too.
The fact that men presented more activation of BA 8 for the second ad shows a more successful memorization (Astolfi et al., 2008). The precuneus (BA 7) and the supramarginal gyrus (BA 40), also more active in this case, are responsible for memory retrieval, showing that not only was the memory formation more effective here, but so was memory retrieval (Lundstrom et al., 2005). In the limbic lobe, there was also an increased activation of the posterior cingulate gyrus, important for evaluative judgment (Zysset et al., 2002).

CONCLUSIONS

During this exploratory research, we used a simple paradigm with no standard stimuli, to approximate the experiment to a natural watching of TV commercials. It proved to be effective to produce relevant frequency and LORETA data.

The frequency analysis and LORETA analysis were vital to obtain pertinent results for this study. The wavelet transform and the sLORETA technique allowed the study of the neural responses over the whole ad and a good localization of the sources of those responses for specified time intervals.

Thanks to the wavelet transform, it was possible to pinpoint moments, where memory, attention and emotional processes were particularly elicited. This was observed for the first commercial in moments where either the brand, or the product, were presented, as well as in moments where the protagonist is highlighted. In the second commercial, besides these moments, times where other famous figures appeared also generated greater responses.

Using sLORETA, differences in the initial responses, from one commercial to the other, were verified mainly in auditory processing regions, in the temporal lobe, and regions related with selective visual attention, for both genders. Also, structures in the frontal and parietal lobes related to memory processes, in the occipital and temporal lobe for face specific processing and zones of the limbic system related with attitude formation.

It was observed that replacing the sound of one ad with the other did change the attention responses considerably, even though it did not clearly modify the preference of one song over the other. Also, sound alone seemed to be much less effective to catch the subjects' attention when compared with the Sound & Picture condition, and in some cases it was even perceived as deviant by the subjects. So, from the point of view of the advertisers, reusing the image of an older ad with new sound effects seems to be less effective.

Moreover, picture by itself also presented loss of some of the effects found in the Sound & Picture condition like emotional reactions, and the use of just sound seemed to lose the attention of the subjects. It seems that these two elements amplified each other, as the combination of both did not just generate a superposition of their individual reactions, but also, generated more constant emotional
reactions and more attention peaks, which, due to their larger average amplitudes show that these reactions occurred more consistently across subjects. So, a TV commercial seems to be generally more effective in creating involvement, than a radio commercial, for instance.

THE SIGNIFICANT VALUE OF INTELECTUAL CAPITAL IN TERMS OF ITS EXPOSURE

ABSTRACT

Revolution of knowledge and the knowledge-based economy have as foundation the knowledge with their role in the contemporary economy.

In recent decades it has been noted and taken into account the favourable evolution of economic importance, information technology, human capital, economic processes, capabilities and skills of the organization as organic factors related to knowledge.

Intellectual capital is renowned as a vague and somehow confusing concept, due to its boundaries that are not well-defined, and interact more often with the concept of human capital.

Due to the development of modern society and its implications, the human factor continues to be a pawn in the process of production, a fact proven by his creative ability and responsiveness to self-development. The human factor, the qualification of the labour force and its rational use is the vital elements of adaptation to the effects of transformation of science in direct production, force the pace and extent of economic development, and exploitation of natural resources.

One of the key elements that support the profitability of the company is represented by intellectual capital, which is why it increases its significant level.

The Organization for Economic Cooperation and Development (OECD, 1999) describes the "intellectual capital" as the economic value of two types of intangible assets relating to a company, such as: organizational or structural capital and human capital.

Globalization and the growth of technological change have led to the creation of a high performance workplace. In this environment, intellectual capital is and remains the foundation of our success.

Keywords: intellectual capital, value, human capital, exposure, knowledge based economy, structural capital, external capital, internal capital.
INTRODUCTION

As time and technology develops and resizes permanently, in a very short time, the theoretical and practical concepts of the economy are being redefined.

Due to these developments, the results of intellectual work are the ones that prevail for each nation.

Therefore elements such as scientific and technological research, education employment, sophisticated software, advanced telecommunication and electronic finances have become key sources of labor tomorrow, but nothing is more important than knowledge organization itself.

The New Economy is an economy dominated more by global influences and speed, often in real-time communications and information, regardless of distance. Basic features are globalization and digitization, which gives intangibility international transactions, both trade and direct investment. It is characterized by the appearance of new types of companies, new industries and the provision of services (Marian Covlea, 2010).

On the basis of the knowledge revolution, knowledge-based economy, is a key part in the knowledge that you have them in the contemporary economy (Cristina Burghelu, 2012).

Knowledge means the cumulative and aggregate inventory data and information, but also skills arising from their use by the receiver. Skills depend on the intellectual capacities (perception, judgment) of the receiver, and the main feature of knowledge (which is coming out in preference to the data and information) is their ability to generate added value through their appropriate use.

We live through excellence in a world dominated by intangible services. Any economic resource can no longer be harnessed properly without the contribution of intangible investment.

The intellectual capital of an organization is made up of human capital (know-how of its employees) and its structural capital (organizational and intellectual property). In other words, its main ingredients are human capital (which is the potential value of the company assets), intangible assets and intellectual property.

A good human capital management might create intangible value for the company.

Nowadays intangible assets based on intellectual capital and raw materials are represented by knowledge and information.

FEEDBACK ON THE VALUE OF INTELLECTUAL CAPITAL

In today’s competitive environments has proved that our creation of value can be retrieved in a company’s intellectual capital, to the disadvantage of physical and financial capital.

According to the accounting-financial studies conducted by the companies listed on the stock exchange it can be observed and documented the same significant gaps permanent existing between the book value of accounts of organizations and their market value (Cuganesan et al., 2006). In support
of this hypothesis is also the analysis made available to the public by the consulting firm Accenture, which indicates that, for the intensive and detailed knowledge of the company, its assets and tangible resources include usually between fifteen and twenty-five percent of the value of the company (Ballow et al., 2004). The same study shows that that most of the companies listed in the United States of America, expectations of future increase in value (as opposed to current incomes) comprise nearly 60 percent of the current value of the company. Therefore, the adoption of a formal framework to facilitate the reporting of intellectual capital is a way for businesses to identify explicitly, auditing and managing intangible sources of value creation and their communication both internally and externally (Petty et al., 2009).

THE PRESENTATION OF INTELLECTUAL CAPITAL

Intellectual capital is made up of stocks and knowledge flow available within an organization. They can be considered as intangible resources, tangible resources that together form the market value of a business.

Intangible resources are defined as factors other than financial assets and physical processes that contribute to generating value of a company and its control (Ion Anghel, 2008).

The multiplicity of definitions and approaches of this concept on the one hand show their importance, but at the same time, the difficulty of expressing something as "untouchable". "Intellectual capital is intellectual material - knowledge, information, intellectual property, experience - that can be used to create wealth" (Stewart, 1997).

Another definition might be rendered as follows: „Intellectual capital means intellectual material which signifies was formalized, captured and used so produces an asset of far greater value" (Stewart, 1997:67).

In other words, intellectual capital encompasses everything that every employee knows in a company and can be used to develop its competitive capacity.

Most times this term was associated with a dynamic intangible resources and activities that underpin sustainable competitive advantage of organizations, but both theoretically and practically this form did not contain the essence of terminology.

Intellectual capital may include potential knowledge such as: customer list, benefit from contracts, intellectual input of employees or management processes.

Nowadays the concept of intellectual capital is considered abstract, but in the economy is defined as "an estimate of a person’s ability to produce income through labor" (Di Bartolo, 1999), the latter may be the starting point desire for success of a company.

As stated Bontis, intellectual capital is a collection of resources related intangible flows.
In one of his works, Edvinsson, names intellectual capital as a (hidden) of intangible assets that do not often appear in the balance sheet.

Harrison and Sullivan, said that this element is knowledge or science that can be converted into profit (the benefits).

Roos: intellectual capital represents all the knowledge of the companies and the translation of this knowledge into practice through trademarks, patents and other brands.

According to Brookings, the difference between inventory value and what someone is willing to pay for it.

According to the literature, we can mention the idea of defining intellectual capital as a product obtained by the combination of technical developments, economic and social, political elections or implied and cultural value system underpinning decisions.

Most of the times it was considered to be ‘good name’ of team leadership in any organization.

Expansion of intellectual capital can be achieved if the organization is present innovation and creativity.

Intellectual capital includes four categories of intangible assets, namely:

a) **active market**: trademarks of market segments, reserve orders (to the extent that the production process can fly), distribution channels, assignment contracts, licensing or franchising etc. Used effectively, the assets of this organization creates competitive advantages in the market;

b) **infrastructure assets**: technology, work methodology, specific techniques that make an organization to function effectively. This type of assets the culture of the organization, its financial structure, databases management systems. These values determine how employees work and communicate with each other, interdepartmental relationships within the organization;

c) **intellectual property assets**: copyright, software patents, industrial designs, trademarks, product, service (industrial, commercial), know-how, technical secrets manufacturing etc.;

d) **human values**: the professional skills of employees, including experience, ability to state and solve problems, leaders etc. Such values are crucial to the organization because it is expensive to hire, train and maintain them at a high level. Talent and professional skills are in possession of the human factor, not the organization for which he works.

In the case of the Romanian television Company, intellectual capital is playing an extremely important role in the development of the institution and the increase in the value and brand awareness in the audiovisual field. With the investment in intellectual capital, the company will ensure increasing success.

Human capital represented by employees, is subject to a rigorous selection process and subsequent training programs and continuous improvement so that exhibit a high degree of professionalism,
which is consistent with current and future requirements and demands of the market.
The high level of skill and education of personnel ensures competitiveness of Romanian television Society in the field of mass-media by promoting with the help of six television channels: TVR1, TVR2, TVR3, TVR, TVR International News and TVR HD and five Studios (Cluj, Craiova, Iași, Timișoara, Târgu-Mureș) values such as public interest, pluralism of ideas and opinions in conditions of impartiality and promote high standards of ethics and professionalism.

PRESENTATION OF THE MODELS OF INTELLECTUAL CAPITAL

In the literature there are presented several models highlight the structure of intellectual capital, the best-known highlight patterns of composition of brainpower is presented in the following order.

THE EDVINSSON MODEL

As a result of the experience of the company Skandia has come to the conclusion that both financial capital and the intellectual part of the market value of a company’s intellectual capital is made up of human capital and structural capital, exactly as shown in the following figure.

![Skandia Framework](source: Skandia and adapted from Bontins, 2000)

Given Edvisson's statements, the market value of the company is given the capital and intellectual capital, having the form of presentation:

- **human capital** - tacit or explicit knowledge highlighted that people have the ability to generate their knowledge, values, attitudes, skills, know-how, philosophy and culture - useful for the organization's mission;

- **organization capital** represented by combining explicit and tacit knowledge, formal and informal structures due to efficiency and effectiveness and develop organizational activity of the
company. It also includes culture (tacit knowledge and informal), structure (formal and explicit knowledge) and organizational learning (renewal of the tacit knowledge and explicit processes, formal and informal);

✓ structural capital includes all the powers and elements of human capital infrastructure support.

**SVEIBY’S MODEL**

This model of human capital components defined in the internal structure of company management and training methods at the level of the company and the external structure of the company’s customers and the individual components, which consists of the education, training and improvement of the individual, as shown in Figure 2.

![Figure 2 The Sveiby Model](Source: Sveiby, 1997)

Human capital refers to the talents or powers held training and education, as well as the experience and value characteristics of an organization.

External capital comprises relationships with suppliers, customers and the brand, trademarks and reputation.

Internal capital refers to the knowledge embedded in organizational structures and processes, and includes patents, part of research and development, systems and technology.

**THE MODEL IN ACCORDANCE WITH “THE TECHNOLOGY BROOKER’IC”**

The model is based on the idea that market assets, intellectual property-based assets, assets based on human resources and specific infrastructure assets are components of intellectual capital, as follows:
THE MAGIC (MEASURING AND ACCOUNTING INTELECTUAL CAPITAL)

This model appeared in the European project MAGIC, which had the goal of developing a methodology for intellectual capital, but also a reliable measurement. According to the model, intellectual capital is made up of: human capital, organisational capital, capital and market capital of innovation, as shown in Figure 4.

An overview of the perspective of recognizing intellectual capital composition shows that the concept of intellectual capital is often associated with human capital (considered in all 4 models as the main element of intellectual capital). Thus the analysis of the four models we see that we must make an
accurate distinction between the two forms of capital (human and intellectual). Intellectual capital is composed by other elements in addition to human capital (organizational, market or innovation). Also the models presented reinforce the idea of intellectual capital to be considered a hidden treasure, with the purpose of helping the company to develop technologization society, digitization and hence knowledge.

Of the four models presented show that the conceptual development of intellectual capital was made in two different directions: the first direction turned to the need for growth and development companies, and competitive capacity market, using data from harnessing the benefits of the intangible assets. The second direction is related to the desire to increase corporate success through investment in intellectual capital.

CONCLUSIONS

Due to the fact that we live in a world dominated by intangible services, it is observed that economic resources can be recovered only through intangible investment.

Intellectual capital is a concept somewhat vague and confusing, its boundaries are not well defined, and often interact with the concept of human capital.

In accordance with the entire contents of this article, we demonstrated that intellectual capital is considered an intangible element.

Intellectual capital exposure models presented in this article reinforce the idea that intellectual capital is considered a hidden treasure, with the purpose of helping the company to develop technologization society, digitization implicit knowledge.

Intellectual capital comprises besides the existence of stock or assets, resources and the ability of the organization to transform a resource to another. Pure presence resources can not generate value. Harnessing these resources, especially how to transform a resource to another, are very important and for this reason it is necessary to find a solution for presentation of those resources.

We are in a perpetual stage of redefining and renaming the economy, society, ours as individuals, so physical things do not have the same meaning, with a focus on knowledge. It is important for every company to invest in the creation of intellectual capital, both through human capital by means of training and managers, and by implementing structural capital.

In conclusion, regardless of the benefits that the company provides intellectual capital and the major role it plays can not be included in the financial statements. Remains significant "hidden treasure behind Financial Statements", the currency of the new millennium.

THE ROLE PLAYED BY CITIZEN SERVICE CENTRES IN FACILITATING E-GOVERNMENT DIFFUSION IN GREECE.

Voutinioti, Anastasia

ATEI of Peloponnese, Greece.

ABSTRACT

The aim of this research is to investigate the role of ‘Citizen Service Centers’ (CSCs) in e-Government adoption in Greece. The ultimate aim is to contribute to the understanding of the role CSCs, third parties, play within the e-Government services’ mechanism. This paper by using a case study approach, shows that CSCs improve availability, accessibility and enhance trust, privacy and security issues and could play an major role in bridging the gap between e-Government implementation and demand; and thus adoption and diffusion of e-services in Greece. At the practical level, the research aims to help e-Government policy makers to better plan, design and implement policies and strategies to increase the take up of e-Government services.

Keywords: e-Government, e-Government adoption, e-Government implementation, intermediaries, Citizen Service Centres (CSCs), e-KEP, Greece.

1. INTRODUCTION

Governments around the world decided to go online by employing modern information and communication technologies, in order to improve government processes (e-administration), offer e-services, connect citizens (e-citizens and e-services) and build interactions with and within civil society. These e-services are deployed through government portals and different other channels. Among them, third parties or intermediaries are used to provide a direct connection between service providers and their clients. They have become a central issue to leverage the e-government relationship with their stakeholders, government, citizens and businesses (Al-Sobhi et al., 2009). This is particularly significant as most of the existing e-government systems alone fail to resolve the coordination between stakeholders (Heeks, 2003a).

In developed countries a number of studies have been conducted to determine factors that encourage citizens to use e-government services; relatively few researches have been examined these issues in other countries, like Greece (Tambouris et al., 2004; Karavasilis et al., 2010 ). In addition, research that could promise to explore the role of the intermediaries in the e-Government context is vitally important (Al-Sobhi et al., 2009). Therefore, the understanding of what influences citizens to adopt e-
government services in addition to the role played by the intermediaries, has research value and implications for strategy makers and researchers.

The contribution of this paper is to examine the roles played by intermediaries and the main aim is to investigate their potential value in e-government service delivery. The results of this study should support government agencies in developing a better intermediation and reintermediation strategy that help reducing the gap between e-Government readiness and citizens’ ability to adopt the new e-services.

The remainder of this paper is organized as follows: the next section reviews literature on intermediaries and their roles on electronic environment and on e-Government in particular. Section three illustrates the background of e-government in Greece and the roles of Citizen Service Centres in the Greek initiative. In section four, the adopted research methodology is presented. In section five, results are presented and discussed, while section six summarises and discusses the key findings; and finally section seven concludes by outlining implications and recommendations for policy makers.

2. LITERATURE REVIEW

A main principle of the e-government systems is to deliver e-services for different stakeholders, but many times these principles are not met due to barriers, like lack of infrastructure, digital divide, and low trust. Then third party entities can provide citizens a useful access gateway and support for e-government services, especially if they are consolidated alongside information technology (Bailey and Bakos, 1997). These third party entities under different names (Intermediaries, Cyber cafés, or Telecentres) have been widely used for years all over the world (Furuholt and Kristiansen, 2007) and have technology, skills and knowledge on critical government factors that are necessary for successful government-to-citizen (G2C) relationships (Al-Sobhi et al., 2009). They have been mostly termed intermediaries (Heeks, 2002). They consist of a physical space and premises, are equipped with ICT and administrators (officers) to assist citizens with different government agencies (Bailey and Bakos, 1997).

Intermediaries’ presence stems from e-commerce; they have been establishing relationships between the service providers and service requesters. Their relationships have been examined and are changeable over time as a result of the environmental and social conditions (Ehrlich and Cash, 1999). Chircu and Kauffman (1999) identify a variety of strategies that appear in the relationship between players that change from intermediation to disintermediation and reintermediation (IDR strategies cycle). Disintermediation means the removal of the physical intermediary from the service delivery channels (Chircu and Kauffman, 1999). With the emergence of Internet applications and the growth of e-business, there was increasing concern that the roles of intermediaries were being eliminated or
subject to disintermediation (Gellman, 1996). Disintermediation cost theory has been criticised by a number of researchers (Chircu and Kauffman, 1999; Bailey and Bakos, 1997). Instead of disintermediation, intermediaries could return (reintermediation), especially if they are “facilitated with information technology” (Bailey and Bakos, 1997). The term reintermediation refers to the emergence of new intermediaries in electronic service environment by re-establishing them in the centre of the e-service transaction process (Chircu and Kauffman, 1999; Bailey and Bakos, 1997); they add value for the service provider and requester in many aspects. Besides facilitating communication between service providers and their customers (Janssen and Kilevink, 2009), they work as a partner for helping a service requester access services provided electronically (Al-Sobhi et al, 2010). In other cases they result in increasing their roles when factors, such as trust may influence their position (Datta and Chatterjee 2008; Bailey and Bakos, 1997).

In e-Government literature an intermediary is an important element in the e-services domain and it may play a key role in helping the stakeholders to engage with new e-Government services. They can help in improving e-government adoption and decrease the challenges that occur; they help increase accessibility of e-services, by offering more points of availability for the public; they support different government agencies in the delivery of e-services, as their tasks involve management of electronic service delivery and operations on related systems; they act as mediators for citizens who require access to e-government services because of the digital divide. In many cases they support the promotion of e-services (Sein, 2009) as well as the training and education needs of citizens, by facilitating the assisted use of technology. In other cases their establishment (Al-Sobhi et al., 2009) was influenced by the difficulty in verifying the identity of stakeholders (e-identification). In summary, the intermediary entity can be conceptualized along several dimensions. Their services can range from simply providing physical access to facilitating use through online and offline service and all the way to activism (Sein, 2009).

Intermediaries can be government organizations or “Civil Society” (Gronlund, 2000) consisting of non-governmental organizations (NGOs) and concerned citizens such as activists and religious voluntary bodies (Wahid et al., 2011), as well as aid organizations (Bailey, 2009). In a few cases, especially in the developing world, these intermediaries, termed mostly internet or cyber cafés, or telecentres, provide help to users in accessing the Internet through services such as trouble shooting, tips etc (Mutula, 2003; James, 2005; Tan, 2007). They may also provide additional services such as fax, digital photos, and some go further and conduct training and education to users and prospective users (Kristiansen et al., 2003).

Beyond the above roles, intermediaries can also take an activist role with the aim of empowering disadvantaged groups; Tan (2007) examined the role of volunteer women organizations in Tanzania
and Madon & Sahay, (2002) the role played by an NGO on behalf of slum dwellers in India. Madon (2000) examined the use of the Internet in sectors such as agriculture, health and education, and derived some conclusions for government intervention, including the important role of intermediary institutions. The DNet project in Bangladesh (Sein and Furuhol, 2009), explicitly uses intermediaries, run by women who use mobile phones. This advances the empowerment of women and also leverages the power of mobile phones that is perhaps the driving force behind the next ICT wave (Heeks, 2008).

In other cases, especially in Africa many internet access points are either set up by organizations such as NGOs or are arranged by organizations (Mukerjee, 2008). In the latter role, these organizations do not set up telecentres or cafes themselves, but provide financial, infrastructural and consulting support to entrepreneurs to do so.

Kantor Pelayanan Terpadu (KPT) One-Stop Services is an example of an organizational intermediary in Indonesia e-Government. Its operators are the contact point with the citizens. Intermediation is indirect with the scope of providing a “packaged” service consisting of online and offline services. This can be described as “Government Intermediary” which provides simpler processes to citizens who need to get certain permits and licences (Sein and Furuhol, 2009).

All over Europe (e.g. Finland, Germany, Spain) there are government organizations that operate one-stop-shops services for the public. In Spain the Offices “060”, run by government organizations support citizens in obtaining information and guidance about the services provided by the public administration. In some of them there is also launching the processing of these public services (UN DESA, 2012).

In other countries UK and Italy, Public Private Partnerships have been established between entrepreneurs and government organizations. In Italy, Reti Amiche initiative adopted with the aim of bringing the public administration closer to the citizen. By utilization of existing in the private sector networks and channels (Post Office, Tobacconists, large-scale retail trade outlets, ATMs, etc.), provide user friendly and easily found access points. More than 70 per cent of these front desks are Lottery, Betting Offices and Tobacconists. They mostly issue documents such as passports, birth, marriage and death certificates and residence permits; and also payment transactions such as social contributions for domestic help, taxes and fines (UN DESA, 2012).

In all cases reported, intermediaries are local and close to citizens to address their particular needs. In addition citizens are also more likely to trust a local intermediary than the government reflecting the general distrust of governments, especially in developing countries (Sein et al., 2008).

While the interaction between a user and an intermediary happens at an individual level, there is also an organization level of intermediation. Recent trends at new public service production and delivery
models, distinguish front offices from back offices. Thus, front offices may materialise as Internet portals, call centres, or physical one-stop-shops, all enabled and assisted by ICTs, while back offices can be located anywhere and their interconnection, collaboration and co-ordination will become more crucial than ever (EIPA, 2003). This new service production and delivery model provides an opportunity for down-sizing and integrating back offices and thus making administration more efficient and streamlined; additionally by developing high quality services with more relational approaches in the front offices, making government more user centric (Millard et al., 2004).

The concept of using a third party to the vision of e-Government highlights the increasing importance of intermediaries – i.e. public partners, private and social in the delivery of public services and in the exercise of democratic governance. Governments will need to better understand the potential of these actors, in order to develop stronger, more innovative and longer term collaborative models and partnerships with them.

3. E-GOVERNMENT IN GREECE

A number of initiatives have been deployed by the Greek government to assist e-Government and ICT adoption and diffusion. These initiatives were driven by European Union (EU) funding, on respective actions through the Community Support Framework (CSF) periods (Hahamis et al., 2005). Since the late 1990s, initiated from the EU funding and guidelines, Greek government has cultivated its web presence by establishing web portals to offer electronic service delivery to their citizens. That period, being in line with the above, the national e-Government modernization agenda included the establishment of the Citizen Service Centers (CSCs -KEP in Greek), the intermediaries, to facilitate government service delivery and seamless interaction to citizens. They have been seen as an initial model of multi-channel strategies for e-Government service delivery.

Nowadays there are 1060 CSCs running under the supervision of Greek municipalities, operate all over the country and mostly work on behalf of citizens as a front-end of government agencies to deliver seamless e-services (Tambouris et al., 2004). Therefore there is an increased convenience for both citizens and businesses in using the CSCs as a multi-service vending facility. So far, they have provided mostly face-to-face contact with citizens and enjoyed their trust (Tambouris et al., 2004). They are gradually being transformed to e-CSCs, following government legislation and technical requirements in terms of security, data protection and electronic transactions.

Although Greek government has invested heavily in e-Government implementation, there have been varying results and delayed outcomes. The empirical findings illustrate that the adoption and diffusion of e-Government in Greece comes second last, in the 27 EU countries (European Commission, 2010).
4. RESEARCH METHODOLOGY

To empirically explore and validate the arguments set out above, a qualitative case study approach was considered suitable (Walsham, 1993). A case study examines a phenomenon in its natural setting, employing multiple methods of data collection to gather information from one or a few entities, e.g. people, groups, or organisations (Yin, 2003). He also argues that the main advantage of semi-structured interviews is the flexibility they offer in understanding events by getting close to it, providing rich primary data and more detailed information. In this research, semi-structured interviews constituted the main data source.

Heraklion city, a large city in population terms in Crete region, Greece was selected in this experiment. The rationale for selecting it is because of its importance in terms of e-Government in Greece. Heraklion launched e-government services in late 1990s and over the last years, the Heraklion e-Government initiative has operated a set of different e-Government projects and it scores high in the e-Government agenda in Greece. For the three last years (2012, 2013 and 2014), Heraklion was announced ‘smart21 community’ of the world, by Intelligent Community Forum.

As Heraklion initiatives adopted CSCs in 2002, findings of this research will support central and local government in Greece, to develop strategic plans in order to assist the adoption and diffusion of e-government services.

One set of interviews was conducted between November and December 2013, by visiting a large government department at Heraklion. Two high officials were interviewed, using semi-structured interviews, which offered the opportunity to obtain an overview of e-government implementation, as well as the challenges facing e-government. Other set of interviews with the directors of the two CSCs and staff set out to collect data from the CSC organisations were carried out at the same time, by visiting the two CSCs in Heraklion.

5. RESEARCH FINDINGS

Interviews with high e-Government officials identified a number of challenges currently facing the CSCs and e-Government implementation. They mentioned that e-services provided or the e-Government projects overall are not fully implemented yet and only selected services are available online. This has resulted in lack of consistency in promoting the idea of e-Government and it is also having a negative influence on the adoption of e-services into society. Another key challenge highlighted by both interviewees was the integration of different government departments along with infrastructure. They concluded that implementing an efficient e-Government infrastructure is not an easy task and needs funding, time and effort from all government agencies. Employees’ scepticism was also mentioned to be one of the important challenges in terms of e-Government services.
Another issue mentioned is technologies themselves are still a problem in recent times. There are still great concerns about the privacy of personal and financial information and security issues in implementing e-Government technologies in combination to low trust in government; security of information flow is highly important in the Greek context, where citizens are less exposed to online services. Thus training people (staff as well as citizens) in the usage of ICTs is a very important issue in the e-Government strategy. Another key issue is e-identification which has not been fully established yet in Greece.

5.1 The roles of CSCs in facilitating e-Government services

To complement the interviews with government officials, interviews were conducted with managers and staff of two CSCs in Heraklion. The focus of CSCs in Heraklion and all over the Country is mainly on connecting government departments with their stakeholders (citizens and businesses). In addition, CSCs’ role is to control the transactions flow between different government departments and agencies on behalf of citizens, in both directions. CSCs’ well-trained officers were found to assist citizens and business with government services, some of them being accessed through the central Government portal “Ermis” or e-KEP. Both CSC managers argued that there are always people on their premises waiting on line to get serviced for different reasons. Some Heraklion CSCs visitors do not have internet access at all, while others are having difficulties to use internet to obtain e-Government services; others are not happy with new technology gateways, especially minority groups and those with low education. In many cases also citizens need CSCs assistance because of lack of trust, information privacy and security. Interviewees highlighted the role of CSCs, as a third trusted party that take responsibility on behalf of citizens for all transactions. In this respect of providing personal information on transactions, CSCs have an important role as well; to build trust between government and citizens in relation to the e-services. Another very important role found, is that CSCs, having the legal authority, authenticate citizens in e-services that require it. Besides the above, CSCs managers stated that awareness of e-Government services in the Heraklion community is low; and if the citizens were aware of the benefits of e-Government, it would promote the adoption rate of e-Government services.

While mentioning various roles of CSCs, interviewees agreed upon the one of training the citizens to self-use new technologies and government e-services, is essential. However their services are limited to giving support to get services, due to their limited resources, capabilities and time. It has been clearly indicated a positive attitude from CSCs’ staff to promote the training of Heraklion citizens in using e-services gateways, but it has not been achieved yet.

6. DISCUSSION AND CONCLUSIONS

Besides the qualitative case study (interviews) with Greek government agencies and managers of
CSCs, literature review was used to explore the above themes. According to Al-Sobhi et al. (2009), the success of e-Government will be influenced by three dimensions: 1) factors influencing implementation; 2) factors influencing adoption and usage by citizens 3) role of intermediaries in bridging any gap between implementation and adoption. Accordingly, if there are difficulties on implementation or impediments on adoption they are mediated by intermediaries.

As this research has discovered, the establishment of CSCs in Greece, mostly through physical presence, have been proven to be partially successful in bridging the gap between e-Government implementation and citizens' adoption of e-services. Even if CSCs are trying to transform to e-CSCs, their webpage (www.e-ker.gov.gr) is underutilized by the public. Furthermore, the results of this investigation show that CSCs' visitors are also influenced by a low level of trust in technology, in Greek central and local government. The enhancement of ‘trust’ on e-Government by intermediaries has been previously acknowledged in different contexts (UN DESA, 2012).

The interviews indicate that their agencies only provide support on behalf of citizens who apply for services (i.e. workers completing the tasks on behalf of the citizens), by accessing e-KEP and ‘Hermis’ and other government webpages. Another important finding is that there is no individual training offered to citizens by CSCs in self-using the e-services. Training citizens in the self-usage of e-Government services should be a major role of CSCs, as more e-services are implemented and offered on line and citizens’ ICT literacy increases.

The findings of the research are in line with other research undertaken in Saudi Arabia (Al-Sobhi et al., 2009) that takes into account intermediaries. Similar results also have been obtained in research regarding citizens’ interaction with electronic services in municipalities, in Attica (Kalogridis, 2007; Karavasilis et al., 2010; Delitheou and Maraki( 2010); Voutinioti, 2013). They have found that citizens’ interaction with municipal websites is mostly restricted to sourcing of information material rather, than to engaging in interactions or transactions. A few reasons for this attitude revealed in the study include: citizens’ concern for the safety of their personal data, low educational level and the complexity of municipal electronic services provided.

7. IMPLICATIONS FOR POLICY MAKERS

Findings contribute to theory by understanding the drivers of e-Government adoption as well as the role of the CSCs. This research has practical implications for practitioners and strategy makers to further enhance delivery of e-services through multi-channel service delivery and the ways in which e-citizens might increase their willingness to interact online.

E-Government websites alone do not influence to e-Government services adoption; different segments of the population have different needs and make contact with government via different channels
(multi-channel delivery). In Greece a great majority of the population is likely to seek help (from CSCs) to interact with government online. Indeed, this study emphasises the very important channel and intermediary (CSC), to assist communication with citizens online and to act as a trusted gateway towards e-services.

Roman and Colle, (2003), pointed out that intermediaries have to change as the environment changes (reintermediation), must go beyond their initiatives and emphasize the importance of community needs assessments. CSCs have to be dynamic, transformational, adopt structure other than their initial and play different roles in the transition process. As CSCs’ staff is well ICT trained they should inform visitors about the availability of e-services, using new technology (computers, PDAs, smartphones, laptops); and also they should train visitors in using e-services, while transforming to e-CSCs. By assisting to self-using the new technology waiting lines will be diminished and this model is scalable as adoption rate increases (Al_Shobhi et al, 209). Their roles in awareness, promotion and training, are very important because they operate at the local level and they are capable of reaching easily the target group. As availability of e- services increases, promote the e-services provided at the Central Government Portal ‘Hermis’ and strongly promote e-identification offered there. Assist users in starting the authentication procedure and in creating and establishing an electronic locker, so most of regularly used certificates and permits are stored there, being easily accessible when needed. The above should be done along with general promotion of services set up through TV, newspapers, radio, social media etc, in order to promote e-Government benefits. Thus they can gradually be transformed to e-CSCs and the traditional offices have to operate as informational Customer Service Centers, providing mostly information, like the ones in Europe.

Among the different channels, mobile-based technologies hold tremendous promise in developed and in developing countries and in particular in rural areas, and can be expected to play a leading role in multichannel service delivery (UN DESA, 2012). As e-services are gradually been available as m-services too, encourage their use, provide help and assistance with these as well.

Enhance the already established Public Private Partnerships so private operated government authorised partners work in parallel with the municipal CSCs on pay (Post Offices, private new technology companies and voluntary sector). In fact this has already been done in a small scale with the Post Office organization in rural areas and with the accountants for e-tax services. By doing so, they will help in achieving greater access to public services (Klievink & Janssen, 2008). They also refer that experience in the private sector has shown that the creation of a competitive intermediary market will encourage intermediaries to continually improve their services and so contribute to greater take-up of e-enabled public services. Then there will be established a competitive market for intermediaries in public sector delivery too.
The basic assumption in most of the studies (UN DESA, 2012) is that a multichannel service delivery is needed. It is defined as involving the organizational interactions that make up the network, rather than as just a collection of access routes for delivering the service. In multichannel service delivery, all channels should be integrated and coordinated. Front office applications communicate to each other and support the service provision with centrally stored and accessible data. Reports are that the profile of the intermediaries (intelligent intermediaries) who add human skills and knowledge to the presence of ICT, is thus critical for projects that want to reach especially disadvantaged and socially excluded groups (Heeks, 2003b). Public-private partnerships and use of existing private sector channels can help governments to include more citizens in service delivery. Technology alone cannot guarantee that the benefits of multichannel platforms will reach large – and eventually all – parts of the population. Technology needs to be socially and culturally embedded and understood in order to be used effectively to create value. Traditional channels, ideally supported by a robust layer of technology, are still the only option in most parts of the world (UN DESA, 2012). The aforementioned require administrative reforms in most cases and are a matter of policy choice.

EXPATRIATE’S GLOBAL ENTREPRENEURIAL COMPETENCE AND IT’S CROSS-CULTURAL DETERMINANTS

Wang, Christina Yu-Ping1, Jaw, Bih-Shiaw2, Wang, Chen-Yu3
Institute of Human Resource Management, National Sun Yat-sen University, Republic of China

ABSTRACT
Our research attempts to bridge OB and international management (IM) literature by employing competence-based theory to investigate expatriate’s entrepreneurial competence from the cross-cultural viewpoint. By making an empirical research using SEM with sample of 230, the results reveal that expatriate’s Big-Five personality, cultural intelligence (CQ), and cross-cultural adjustment are the key determinants which constitute expatriate’s entrepreneurial competence to strive for expatriate’s entrepreneurship in a cross-cultural context.

Keywords: entrepreneurship, expatriate’s entrepreneurial competence, Big-Five personality, cultural intelligence, cross-cultural adjustment.

INTRODUCTION
Derived from previous cross-cultural literature rooted from international management (IM), MNCs are continuously sending expatriates abroad for international assignments (GMAC, 2007). Positive performance of expatriates’ cross-border activities will lead to company’s business success. However, expatriate’s negative outcomes will cause firm’s investment failure, and likely lead to loss of human capital for the organization (Farh et al., 2010). The main reason of expatriate’s adverse cross-border performance can be attributed to misunderstand of local culture, and inappropriate interaction with local people (Johnson et al., 2006). Namely, it is inevitable that expatriates have to be capable of adapting different cultures, and reducing ethnocentrism conscious (Caligiuri and Tarique, 2012), which can facilitate their entrepreneurial outcomes in a cross-cultural context.

Contrast to cross-cultural viewpoint, literatures from OB theory also emphasize the importance of individual’s personality, such as extraversion, openness to experience, conscientiousness, and emotional stability, which lead to entrepreneurial success (Zhao et al., 2010). However, taken from a competence-based perspective to investigate the cross-cultural phenomenon, individual who works under a diverse cultural environment should not only equipped with entrepreneurial personality, but also need to possess a set of cultural-specific knowledge, skills and capabilities to strive for
entrepreneurial success in terms of interacting successfully with the people who have different cultural backgrounds (Johnson et al., 2006).

Although current research from OB, entrepreneurial theory and cross-cultural literature have emphasized the importance of individual's personal traits and cross-cultural adaptation (Johnson et al., 2006; Lee and Sukoco, 2010) on expatriates’ performance abroad, few studies have taken a competence-based perspective to examine how expatriates generate cross-cultural adaptation and initiatives especially under a cross-cultural context. To bridge the research gap in current literature, our study aims to integrate OB and cross-cultural literatures and adopts the competence-based theory to build an integrative framework in quest for critical factors, which shapes expatriate’s entrepreneurial competence in order to facilitate their cultural adaptation and entrepreneurship at host.

Accordingly, we find that the combinative effect of expatriate’s Big-Five personality, cultural intelligence, and cross-cultural adjustment are critical to facilitate expatriate’s initiatives at host. We propose that expatriate’s Big-Five personality, CQ and cross-cultural adjustment, jointly enable expatriate’s to exert initiatives more efficient both internally and externally in terms of leveraging different resources between and among subsidiaries, local stakeholders, and corporate headquarter (HQ) for entrepreneurial performance.

LITERATURE REVIEW AND THEORETICAL DEVELOPMENT

Expatriate's entrepreneurship

Entrepreneurship is the action of creating new products and process that consist of external, internal and risk-taking initiatives in order to tap into new market opportunities (Lumpkin and Dess, 1996; Birkinshaw and Ridderstrale, 1999). As talent is the critical asset that will bring MNCs entrepreneurial success, expatriate’s external, internal and risk-taking initiatives will be the most important capacity for MNCs to execute entrepreneurial activities in the host country. Expatriate’s external initiative represents that individuals exploit market opportunity outside the boundaries of corporation (Birkinshaw and Ridderstrale, 1999; Zahra and George, 2002) in order to create new product and services (Drori et al., 2006; McDougall and Oviatt, 2003). In contrast, internal initiative means finding the opportunity within the boundaries of corporation (Birkinshaw and Ridderstrale, 1999). Hence, individual who foresees those non-profit investments or inefficient operations within the whole corporation will proactively take actions to strive for performance outcome (Birkinshaw and Ridderstrale, 1999). In addition, entrepreneurship is also characterized with risk-taking (Covin and Slevin, 1991; Miller, 1983). Individuals with high entrepreneurial orientation will not only create new ideas (Gibson and Dibble, 2008), they will also proactively overcome difficulties and persistently fulfill
the development of those new ideas into execution (Morris et al., 1994). These individuals are keen to adopt necessary behavioral adjustments in a cross-border situation. (Betaman and Crant, 1993)

**Expatriate Big-Five personality**

The Big-Five personality is defined from a taxonomy of many personal traits (Barrick and Mount, 1993; Digman, 1990). Zhao et al. (2010) suggest that conscientiousness and emotional stability are also related to individual’s entrepreneurial activities. High conscientiousness people will demonstrate hardworking and be achievement-oriented (Ciavarella et al., 2004) in order to take challenges and encourage themselves to take calculated risks in the host environment. While taking high risk activities in the host country, individual can feel more psychological stress and experience negative emotions. Therefore, expatriate's emotional stability is important to encourage individual to persist his current task and to endure complications in the host environment.

Zhao et al., (2010) also propose that entrepreneurial function of seeking new opportunity is related to individual’s creativities and openness to new ideas (Ciavarella et al., 2004; Morrison, 1997). Hence expatriates with high openness to experience are likely to take challenges, remain curious to learn how to interact with local counterparts, and act more sociable in maintaining cooperative relationships in order to seek for external and internal initiatives in host context.

**Expatriate’s cultural intelligence and cross-cultural adjustment**

In order to deal with these cross-cultural issues, not only personality is important to influence expatriates’ entrepreneurial spirit (Thomas and Mueller, 2000), individual’s cultural intelligence (CQ) and cross-cultural adjustment (Johnson et al., 2006) are key variables of expatriate’s entrepreneurial competence.

Earley and Ang (2003) define that CQ is a capability for people to effectively deal with cultural diversity, which is a set of cross-cultural competence that consists of cognitive, motivation and behavioral elements (Johnson et al., 2006; Earley, 2002). Cognitive CQ represents knowing specific cultural knowledge, and the ability to develop strategic thinking in a cross-cultural context (Earley et al., 2006). CQ is the capability that enables individual to discover subtle nuances that guide them in their cultural adaptation and adjustment (Earley et al., 2006).

Additionally, CQ emphasizes not only knowledge, but also personal motivation which enables individual to sustain difficulties and challenges when they encounter cultural shock (Earley et al., 2006). Lastly, behavioral CQ represents individual’s ability to observe, recognize, or adapt to local behavior appropriately in the intercultural environment and discover specific cultural signals from local people and adapt themselves to adjust with people in a cross-cultural situation (Earley et al., 2006).
Alternatively, cross-cultural adjustment enhances expatriate’s happiness and satisfaction at host, and enable them to adapt themselves to appreciate local culture (Searle and Ward, 1990; Aycan, 1997; Peltokorpi, 2008). Hence we consider cross-cultural adjustment is the competence that characterized with expatriate’s work adjustment (including responsibility, performance and work effectiveness), life adjustment (the adaptation to local food, shopping, satisfaction with local life), and cultural adjustment (the adaptation to local norm, culture and interaction with local people). These abilities will improve expatriate’s entrepreneurial performance at host environment.

Cross-cultural adjustment allows expatriates to conduct behavioral adjustment at host. This will aid to reduce uncertainties at work and non-work environment (Aycan, 1997; Briody and Chrisman, 1991; Feldman and Bolino, 1999). Well-adjusted expatriate knows how to learn right behavior on the job from their colleagues. Additionally, expatriates who actively interact with local people, or are fascinated with host social life (Caligiuri and Lazarova, 2002) will help them to establish good relationships and behave appropriately in the cross-cultural context.

Towards a framework of expatriate’s entrepreneurial competence in cross-cultural context

Derived from the OB literature and competence-based theory, expatriates’ cultural cognition, cultural motivation and their behavioral adaptation to meet with local culture (Ang et al., 2006; Earley et al., 2006) are viewed as learning-driven competences (CQ and cross-cultural adjustment). However, expatriate’s inherent personality will spur the combinative effects with expatriate’s CQ and cross-cultural adjustment at host. Ang et al., (2006) propose that expatriates who possess positive personal traits are more curious about and likely to take new ideas into account in their strategic thinking; which enables developing broad-minded cognitive, possessing self-efficacy and self-confidence to bring them motivation and full of energy to establish a good relationship with stakeholders (Leiba-O’Sullivan, 1999). Additionally, these individuals are cooperative and trustful to interact with host people (Mendenhall and Oddou, 1985), and are conscientious with their local tasks even when they encounter obstacles and problems (Ones and Viswesvaran, 1997).

As presented in the above literature, it reveals that the combinative effects of expatriate’s inherent personality, CQ, and cross-cultural adjustment strive for expatriate’s entrepreneurial initiatives in the host environment. We emphasize that expatriate’s personality, CQ, and cross-cultural adjustment constitute expatriate’s entrepreneurial competence, which can effectively facilitate their entrepreneurial initiatives in a cross-cultural context. Hence, we hypothesize:

H1: Expatriate’s entrepreneurial competence (Big-Five personality, CQ, and cross-cultural adjustment) has positive effect on entrepreneurship
METHOD

Sample

Survey questionnaires are administrated to MNCs in Taiwan and China covering manufacturing (25.2%), service (25.7%), electronic and information technology (25.2%), trading (8.3%) and financial industries (4.3%). Eliminating those non-reply and incomplete questionnaires, valid survey amounts for 230 (The validity rate equals to 88%; the effective response rate equals to 23%). Survey items are distributed by post and e-mail to those expatriates originated from Taiwan (n=190) and other nationalities (n=40); 36.5% of our sample are assigned to China, 14.8% to North America, 27.3% to Asian countries, 11.7% to Taiwan, and 4.8% to European countries. The demographics of our sample consist of 55.2% male, 59.6% married. Surveyed expatriates' age range from 20 to 65 years old, the majority age group falls between 31-40 (50.9%).

We adopt SEM to conduct confirmatory factor analysis to define dimensions of variables used in current research framework (Personality (Zhao & Seibert, 2006; Ang et al., 2006; and Huang et al., 2005). Cultural intelligence (Earley & Mosakowski 2004; Earley & Ang, 2003). Cross-cultural adjustment (Black et al., 1989; Huang et al., 2005). Entrepreneurship (Birkinshaw & Ridderstrale, 1999; McDougall & Oviatt, 2000; Morris et al., 1994).

ANALYSIS AND RESULT

Harman’s one factor test

Harman’s single factor is used to examine the potential CMV issues by using exploratory factor analysis. We put all the survey items together using a principle component analysis and varimax rotation method to examine the potential CMV problem (Harmon, 1967). As the result, the first factor accounted for only 23.38 percent of the variance. This reveals that the relationships among the variables used in this study have no systematic variance with our measurements.

Structure equation model

SEM is adopted to test the casual effect between expatriate’s entrepreneurial competence and entrepreneurship. The model fit is reasonable which demonstrated as follow: $\chi^2/df =2.866$, $P =0.003$, RMR =0.008, GFI =0.970, CFI =0.975, RMSEA=0.090. We confirm that expatriate’s entrepreneurial competence (including expatriate's Big-Five personality, CQ and cross-cultural adjustment) has positive effect on entrepreneurship (internal initiative, external initiative, and risk-taking innovation initiative) (expatriate’s entrepreneurial competence$\rightarrow$entrepreneurship, $\beta=0.861^{***}$, $p<0.001$, figure 1).
CONCLUSION

Rooted from competence-based theory, this paper portrays expatriate’s entrepreneurial competence and its antecedents (namely Big-Five, CQ and cross-cultural adjustment) in a cross-cultural context. We bridge OB literature to make contribution in competence-based theory by investigating and testifying the antecedents of expatriate’s entrepreneurial competence when working under a foreign context. Doing so allows us to integrate CQ, cross-cultural adjustment, expatriate’s Big-Five personality and operationalize these three variables to deploy the concept of “entrepreneurial competence”, seeking to unlock the antecedents that enable expatriates in their cross-border entrepreneurial successes on foreign assignments. We utilized competence-based theory to unfold the essence of assignment success for expatriates as our attempt to intercept IHRM literature and international management (IM) literature to make contribution in theory development.

In terms of managerial implications, past studies confirmed the prediction of individual traits to entrepreneurial outcomes (Zhao et al., 2010; Ciavarella et al., 2004). Zhao et al. (2010) suggest that conscientiousness and emotional stability are related to individual’s entrepreneurial activities. High conscientiousness people will demonstrate hardworking and are achievement-oriented (Ciavarella et al., 2004) when undertaking foreign assignments. Such personal traits encourage expatriates to take challenges and calculated risks in a cross-cultural context.

On the other hand, institutional factors such as cultural distance, political distance, geographic distance, and economic distance are likely to create hurdles for expatriates in their entrepreneurial performance at host (Ghemawat, 2001). Despite that previous literatures verify the essentialness of
personal traits to expatriate’s entrepreneurial success, it is also noted that expatriate’s knowledge, skill, and ability reinforce and facilitate expatriate’s local understandings, which in turn help them think strategically in cultural situations. (Earley & Mosakowski, 2004; Earley, Ang & Tan, 2006). Thus, expatriate’s entrepreneurial competence enables expatriate to detect appropriately behavioral roles (Earley & Ang, 2003) and make accurate decisions in cross-cultural context. (Earley et al., 2006). These capabilities help expatriate overcome performance hurdles, such as liability of foreignness and cultural distances. In fact, recent study has also shown that CQ inevitably reduces expatriates’ anxiety, while positively fortify their communication ability and job satisfaction abroad (Bucker, Furrer, Poutsma & Buyens, 2014); Cross-cultural adjustment has also been proved as a crucial ability to enhance expatriate’s initiated performance and job satisfaction at host (Nolan & Morley, 2014).

To a greater extent, this study makes contribution by conceptualizing the essence of entrepreneurial competence constituted Big-Five personality, CQ, and cross-cultural adjustment. Our research bridges OB literature with IM research to shed light on expatriates’ cross-border competence for their work-life adaptation at host. It is also insightful to MNCs in their international talent management by means of offering an exceptional standard of selection criteria and human resource practices in grooming and developing potential talents for MNCs’ entrepreneurial performance. Further research in empirical analysis with larger sample size is encouraged to illuminate theory development in the future.

CSR DEVELOPMENT OPPORTUNITIES: MARKETING CULTURE PERSPECTIVE

Žostautienė, Daiva; Susnienė, Dalia
Panevėžys Faculty of Technologies and Business, Kaunas University of Technology

ABSTRACT

Purpose – The purpose of this study is to scientifically ground theoretical insights on development opportunities of corporate social responsibility taking into account marketing culture perspective and to develop methodological provisions enabling empirical research.

Design/methodology/approach – The study is based on general scientific investigation research methods, i.e. systematic approach for scientific literature analysis on social responsibility and marketing culture issues in order to clarify the development opportunities of social responsibility in a company from marketing culture perspective, and to prepare the theoretical framework for the integration of cultural aspects in the research of social responsibility.

Findings – Theoretical studies and insights revealed beneficial social responsibility development opportunities in a company from marketing culture approach.

Originality/value – There is no debate on corporate social responsibility as a phenomenon and its relevance for development of stakeholder perspective, however, more active manifestation of social responsibility in companies is still an issue, especially focusing on customers, suppliers, competitors and employees. Namely this emphasises interdisciplinary and multidimensionality of the topic, as the above named stakeholders are especially relevant to marketing as market actors, and employees as internal marketing actors, whereas acceptance / non-acceptance of changes in the organization is an integral part of the organization’s culture. By employing such triple construct approach, corporate social responsibility development opportunities were set forward.

Keywords: corporate sustainability, social responsibility, corporate culture, marketing culture.
INTRODUCTION

The importance of corporate social responsibility for sustainable development isn’t negotiable, but the implementation of it into corporate activity is often faced with the problems. Undoubtedly business and marketing can become more sustainable from the perspective of people, planet and profit. However, for many marketers the pursuit of sustainability takes them into uncharted territory, and confronts them with many new and difficult questions. What are the benefits of incorporating social, ethical and environmental issues into day-to-day decisions making? How can business identify and make the most of the opportunities arising from the new agenda? How can companies address these issues without being accused of ‘bandwagon jumping’ or superficial responses? These are just some of the difficult and complex questions being asked (Charter et al., 2002). Striving for sustainability often implies reconsideration of conventional management and marketing principals, of stakeholder relationships, of clearer accountability and openness, and higher levels of innovation and co-operation.

Scientists agree that corporate social responsibility can give a competitive advantage for the organization, but at the same time its implementation meets with the difficulties as it requires the limited resources such as time, human resources, financial resources (Mazurkiewicz, Crown, Bartelli, 2005; Perrini, Pogutz, Tencati, 2006; Jenkins, 2006; Hakala, 2012). The distribution of these resources a lot of depends on the cultural environment of the organization. Different organizational culture types can dominate in companies from different industries and countries nevertheless companies should reflect new sustainability challenges in this millennium by re-examining the social and environmental impacts of their marketing strategies. This means re-evaluating their product and service portfolios, as well as the way these products and services are created, produced and marketed. However, this can be a complex challenge for marketers as it comprises company performance influence on stakeholders taking into account raw materials in the initial stage of production and finalizing with the influence long after the disposal of it. In this way marketers will feel that traditional frame of their activity has much expended.

The aim of this paper is to identify the opportunities of corporate social responsibility development within the organization through the corporate marketing culture perspective. The study is based on general scientific investigation research methods, i.e. systematic approach for scientific literature analysis on social responsibility and marketing culture issues in order to clarify the development opportunities of social responsibility in a company from marketing culture perspective, and to prepare the research methodology as well as theoretical assumptions for the research.
CSR AS CORPORATE AND MARKETING CULTURE FOR SUPERIOR PERFORMANCE

The role of marketing in the achievement of superior performance by virtue of sustainability and responsibility practices is explained by the existing literature (Drongelen, Nixon, & Pearson, 2000). Bronn and Vironi (2001) recommend that marketers should apply the triple bottom line theory to build reputation, while Ratnayake and Liyanage (2009) indicate that management practitioners should move away from a one-dimensional financial perspective of business relationships to a holistic view of societal relationships for incorporating sustainability into the culture of the organization (fig. 1).

Elkington (1998) used the triple bottom line theory to recommend sustainability as a cultural revolution for organisations, based on seven initiatives that can be detailed as follows:

1. markets should be driven by competition, i.e. the old market paradigm considers them to be compliant but the new paradigm of driving sustainability as a corporate culture highlights that they should be considered as competitive;
2. to drive the corporate culture of sustainability, managers should change their consideration of corporate value from hard to soft, i.e. pay greater attention to human values;
3. companies should become more open and transparent in their operations contrary to the traditional closed way of operation to demonstrate their thinking, priorities and commitments through activities;
4. the technology life-cycle should be related to the efficiency of the function it performs during its life-cycle rather than considering it as a product;

Figure 8. Linking sustainability, functions and performance (adapted from Gupta, Kumar, 2013).
(5) business partnerships should be seen as symbiotic instead of subversive and competitors should be seen as cooperating with each other through a relationship for a common cause;

(6) time in business should be considered as longer rather than wider with philosophies such as just-in-time to expand horizons and encourage creativity;

The above discussed thoughts imply that corporate governance should become inclusive rather than exclusive by its design and value chain if an organization wants to change the corporate culture towards adoption of sustainability practices for converting its sustainability-driven actions into socially responsible initiatives.

SIGNIFICANCE OF CORPORATE CULTURE FOR CSR DEVELOPMENT

Managers find corporate culture important in organizations because it provides a non-mechanistic, flexible and imaginative approach to understanding how organizations work (Wilson, 1992). Kotter, Heskett (1992) found that culture significantly influenced organizational performance when it either helped the organization to anticipate or adapt to environmental change or interfered with its adaptation. It also serves as the social glue that holds the organization together by providing appropriate standards guiding employees’ behaviour (Robbins, 1996). Werner (2007: 28) summarises the functions of organizational culture as follows: it creates an organization identity that distinguishes one organization from another; it gives organizational members a sense of identity; identifying with the organization creates greater commitment to organizational goals and objectives; guides employees in terms of acceptable behaviours and attitudes, especially when they have to make decisions and solve problems; creates social systems stability with its associated emotional security; and serves as a yardstick for evaluating and correcting deviant behaviours and for rewarding desired behaviours.

Culture differs in organizations; hence Harrison (1993: 11) also describes organizational culture as the “distinctive constellation of beliefs, values, work styles, and relationships that distinguish one organization from another”. In other words, organizational culture includes those qualities of the organization that give it a particular climate or feel. These definitions suggest that organizational culture distinguishes one organization from another organization. Therefore, organizational culture is to an organization what personality is to an individual (Ledimo, 2013).

Culture is articulated in the organization, in order to shape the way in which organizational members should behave. However, these patterns of values, norms, beliefs, attitudes, principles and assumptions may be unwritten or non-verbalised behaviour that describe the way in which things get done; to give the organization its unique character (Brown 1998; Arnold 2005).

Übius, Ü., Alas, R. (2009) conducted an empirical study in 2007-2008 about four different culture types and eight different countries - Estonia, China, Japan, Russian, Czech, Finnish, German and Slovakian.
They made the implications – there is connection between organizational culture and corporate social responsibility. Three organizational culture types – clan, hierarchy and adhocracy predict corporate social responsibility. One organizational culture type – market predicts one facet of corporate social responsibility – the firm performance concerning social issues. This denotes that managers in the organizations with dominating market culture should take the interests of all agents - customers, subcontract firms, consumers, stock holders, employees, trade unions, public administrations and local communities into account.

Corporate culture has significant influence to its employees as it helps to create an internal climate that promotes the self-control and consistency of behaviour, enables the staff to better understand the expectations of the organization towards them, encourages to transform the everyday routine into valuable and important actions and connects the organization with values that are important to the society. Schein (1984) notes that values describe what ought to be, rather than what is. Values therefore have a motivational or aspirational role in organization.

EMPLOYEE INVOLVEMENT IN CORPORATE CULTURE

Corporate culture and its capabilities become resources for the competitive advantage and employee perceptions of CSR activities play an important role in employee attachment to their organization as well as corporate performance (E.M. Lee et al., 2013). Strategically involving sustainability in the culture of the organization through processes can be achieved by creating a workplace wherein employees feel safe to express themselves and share information and their personal ideas about the influence of organization actions on its eco friendliness (Galbraith et al., 2002). An ethos of open communication can make employees feel that they are part of an organization's initiative and encourage them to contribute to the mission of their organizations, which is to become a socially responsible business (Smith, 2010). Such open communications motivate every individual involved with the organisation to express his/her opinion and drive its socially responsible initiatives towards success (Bernaur & Caduff, 2004).

Organizational culture is crucial in understanding employee behaviour and involving them to create it. Literature review indicates that organizational culture has a strong influence on employees’ behaviour and attitudes (Arnold 2005; Martins & Martins 2009; Werner 2007). It involves standards, beliefs and norms that prescribe how employees should behave (Robbins 1996). Thus, it is essential for organizations to assess organizational culture in order to develop strategies to address aspects of organizational culture affecting employee behaviour negatively and to leverage on the positive aspects.
This emphasis on current organizational culture compels organization to develop reactive human resource management interventions to address aspects of culture negatively perceived by employees. This limits organizations from engaging employees further to determine their preferred organizational culture. An investigation or assessment of employees’ current and preferred organizational helps to identify gaps and helps to adopt a proactive approach in culture development and change using relevant human resource management strategies.

MARKETING CULTURE AS A PART OF ORGANIZATIONAL CULTURE

Marketing, in theory and practice, refers to the market activities of an organization, with the intent to reap economic and social advantages. These activities are influenced by organizational culture. According to Cameron and Quinn (1998), culture defines the core values, assumptions, interpretations and approaches that characterise an organization. Consequently, marketing culture is not only influenced by organizational culture but may also be considered a component of it. Deshpande and Webster (1989) have identified few conceptual studies, which relate organizational culture to marketing.

Organizational culture reveals the internal behaviour of the organization, whereas the marketing culture, as an element of organizational culture, encompasses internal behaviour and relationships with the environment, because the very purpose of marketing reflects the environment orientation, i.e., focus to customer, while seeking for objectives beneficial for the organization.

Several different definitions of marketing culture or market-oriented culture are found in the literature, where the most important of which are those of Webster (1995), Narver and Slater (1990) and Deshpande, Farley and Webster (1993). Webster (1995) views marketing culture as unwritten organization policy and rules, which describe the behavioural norms of organizational members, or as the reflection of the importance of the marketing function in all spheres of organization activity, or, further still, as the means, by which marketing activities are implemented in the organization. Webster (1993) asserts that an organization’s marketing culture may be verified by means of measurements of service quality, interpersonal relations, sales-orientation, organization, internal communication and innovativeness. Similarly, Narver and Slater (1990) have developed and empirically tested a model of market-oriented culture, based on orientation toward the consumer, competition and functional inter coordination. In presenting market orientation as a characteristic of organizational culture, Narver and Slater (1990) define market orientation as a very important organizational culture trait, by means of which companies most effectively provide added value to the consumer and strengthen their market position. Marketing culture is defined as a component of organizational culture, comprised of a set of the dominant values, norms, means and behaviour, which characterizes the individuality of the
organization through its interaction with market actors. According to E.H. Schein (1992), values can be defined as a concept of the aim, either explicit or implicit, that is inherent to an individual or group and that affects the choice subject to prevailing customs, method and outcome of actions. Norms (rules) differ from values by a higher degree of specificity and association with certain behaviour. In an organization, values constitute the grounds for the development of specific behavioural norms (rules). Norms (rules) are set for expected behaviours or their outcomes, which are at least in part common to the social group. Means include accounts, agreements, rituals and language, which are created within an organization and have a strong meaning that is characteristic to symbols (Schein, 1992). Behaviours refer to organization’s models of behaviour.

ELEMENTS OF MARKETING CULTURE AS THE PRECONDITIONS FOR CSR DEVELOPMENT

The implementation of the changes in the organizations a lot of depends on the dominating culture and its expression. One of the key forms of culture expression refers to *values* (fig. 2). Values manifesting in marketing activities of the organization comprise the fundament of marketing culture. Values may serve as some of the main connecting chains in a certain group of people, although the values of the group members do not always coincide; however, from the organization perspective, values are important in that they direct the staff for common activity. Values are generally analysed from the individual and societal points of view. Social values refer to things considered important and significant by the society; however, these values may vary from one society to another. Individuals, based on their values ‘what should be’, reflecting the values common to the society and humanity (Jucevičienė, 1996, p. 47), judge what is good and what is bad. Values strongly influence the priorities of employees, decisions being made and behaviours in the organization and it is, therefore, useful to evaluate the influence of values to organizational culture. The more members of the organization acknowledge one or another value (aggregate of values), the lesser is the occurrence of conflicts in an organization. The following values of marketing culture: open communication and employee responsibility are very important strengthening the market orientation and sustainability of the organization. Companies upholding open communication as the key value of marketing culture have a strong marketing culture, because information is spread in the entire organization instead of being kept the responsibility of marketing managers. Employee responsibility as a value of marketing culture enables decentralized making of decisions, thus making the influence of authority and hierarchical levels less important and facilitating the market orientation processes (Vranesevic et al. 2002). According to Strautmanis (2007), social responsibility should be a part of organizational culture.
Development of social responsibility is a change in values orientation, whose task is shaping the attitudes, transformation of the personal position so that it matches individual and public interests.

**Figure 9. Elements of marketing culture as the preconditions for CSR development.**

*Norms* (rules) form in the society and lesser groups of people as a certain desired behaviour directing or even committing to behave in line with the norms (rules) accepted within the group. In marketing culture, norms (rules) can be revealed based on values, while showing the forms and ways of norm expression in marketing. A norm is a kind of idea that exists in the minds of group members and requires for appropriate behaviour (Schein, 1992). Norms form a special code of conduct for a specific group and indicate the behaviours determining the activities of group members (Homburg, Pflesser, 2000). In order to function, norms have to be accepted by the group members. According to Juščius and Snieška (2008) only the organizations, which aim to save all universally accepted ethical standards of social behaviour, can expect a positive attitude and support in the society. Moreover, helping to solve social and ecological problems, they get competitive advantages and ensure their successful work in future.

*Marketing culture means,* such as accounts, agreements, rituals and language, represent the more visible stratum of culture with verbal, behavioural or physical components (Homburg, Pflesser, 2000). Marketing culture means is the most analysed stratum of marketing culture, though we have to understand that marketing culture means include more than just, for example, information systems.
(Jaworski, Kohli, 1993; Kohli, Jaworski, 1990), and encompass the entirety of physical and verbal means used in marketing. Accounts may be related to conversations of employees about other colleagues, whose behaviour is a great example of social oriented behaviour. Accounts motivate the staff and impel them to commit to the organization. An example of social oriented agreement which can become the Ritual could include social events, for example, meetings with manufacturers of green goods or regular awards for social oriented staff members. Language may also specify the level of market and social orientation. For example, social oriented discussions (as opposite to the discussions only about organization's internal problems) during the meetings show a higher level of social orientation.

**Behaviors of marketing culture.** Based on literature on organizational behaviour and marketing as well as the scientific insights referred to above, components distinguished by A.K.Kohli and B.J.Jaworski (1990) are used when examining the market-oriented behaviours:

1) Creation of market intelligence;
2) Spreading of market intelligence;
3) Responding to market intelligence.

Intelligence is perceived as the ability to correctly anticipate, basing upon the necessary information and individual or organization (organizational) culture. Creation of market intelligence occurs through the alignment of activities of separate divisions, organization of joint meetings and product improvement in line with the customer needs. When creating the marketing intelligence, it is important that product improvement should be carried out not only in line with customer needs but evaluating social responsibility, offering friendly environment products.

The spreading of market intelligence is conducted by disseminating the information about the customer product priorities and essential changes in business within the organization and to the general public. This dimension of marketing culture is assessed subject to whether the information about product priorities of customers and changes in the company. Dissemination of information within the organization should not be protracted and the information about the fulfilment of customer needs, social projects should reach all employees of the organization.

A. McWilliams and D. Siegel (2001) notes, that organization, which is complying with the laws, cannot yet be called socially responsible. Responding to market intelligence is carried out through the meetings with the customers and customer opinion surveys, evaluations of changes in the environment and response to them as well as the attempts made to meet the customer needs, educating customer and society.

Marketing culture through its elements presented above helps to attain economic and non-economic benefits and affects the organization performance as social responsible organization. It also helps to
build an exceptional and long-term competitive advantage, because it is not difficult to copy the products and presentation specifics of competitors; however, the development of social oriented culture is a lengthy process and is not easily achievable.

**MARKETING OPPORTUNITIES IN THE DEVELOPMENT OF CSR**

Sustainability and responsibility, when practiced as value of an organisation's culture, develops new marketing opportunities for managers (Teece & Pisano, 1994). Marketing culture is, thus, an element of organizational culture, which manifests itself through relationships between the organization and other market actors. Market actors are consumers, partners, government institutions, competitors and other companies, which have ties to the organization. Based on the above, it may be assumed that marketing culture will manifest itself through organization marketing activities (interaction with the environment) or through internal marketing activities. Practices of sustainability enable marketers to communicate about the orientation of their organization's values and beliefs towards not only satisfying the needs of customers but also towards improving the life of its stakeholders as the organization's prime objective (Menon & Menon, 1997). It enables marketers to create a differentiation by communicating the organization's social responsibility initiatives, such as using environmentally friendly material for packaging the products, or reducing carbon footprints by minimising the use of paper by avoiding hard copy mailing and instead communicating electronically (Shrivastava, 1995). Designing target-based campaigns leads to reduction of the waste produced as a result of promotional campaigns (Frame & Newton, 2007). Marketing initiatives, such as creating awareness about the benefits of sustainable products or services can position the organization above competitors and enable it to enjoy a better reputation (Menon & Menon, 1997). Such initiatives act as a stimulus for customers to buy green products and improve the long term viability of the business by helping organizations to leverage on its socially responsible innovations for economic, social and environmental dividends (Boulatoff & Boyer, 2009). Sustainability-based green initiatives of a organization when acknowledged by entities operating both internally and externally to the organisation influence the organization's reputation and become its identity over a period of time (Rodrigues & Child, 2008) (fig. 3).
Introduction of sustainability dimensions through its elements (presented above) helps to attain economic and non-economic benefits and affects the company performance: sales volumes, profit and success in selling new products. It also helps to build an exceptional and long-term competitive advantage, because it is not difficult to copy the products and their presentation peculiarities of competitors; however, the development of customer-oriented culture is a lengthy process and is not easily achievable.

The role of marketing in reacting to sustainability issues will be different among companies depending on their industry, size, corporate / marketing culture and whether the style of marketing they follow is classically focused towards customer, technology (product) or communications.

Marketing activity and implementation in different surroundings necessitate a detailed analysis of these activities, and their integration into a given economic, social and cultural environment is not an easy task as the same actions of marketing are interpreted differently in different cultural surroundings. Therefore, organizations have to take into account cultural differences when defining their CSR policies and communicating to stakeholders in different countries (Bird, Smucker, 2007).

Often, for commercial purposes, organization leaders and owners make decisions that are inconsistent with the intrinsic principles of social responsibility. However, in pursue of sustainable development, different company activities as well as marketing culture aspects cannot contradict the principles of social responsibility.

---

**Figure 10. Marketing opportunities from sustainability dimensions.**
social responsibility. Rather, the ideas must complement each other and become cohesive interrelated. Marketing culture values and norms should be reflected in the social responsibility ideas. Organizations allocate funds for social projects, but often treat that as one of marketing tools instead of equivalent partnership and systematic cooperation with the stakeholders. Therefore, the need to look for the organization’s opportunities in the implementation of social responsibility principles, one of the possible solutions is the development of socially responsible marketing culture by incorporating it into unified company strategy.

CONCLUDING REMARKS AND DISCUSSION

This paper has created a research agenda for sustainability issues regarding CSR development opportunities from marketing culture perspective in the business domain. Since corporate sustainability and social responsibility research highlights new challenges and opportunities for businesses, the research focused on the company’s ability to practice socially responsible initiatives from corporate and marketing culture perspective and create new opportunities for operations, management and marketing.

In companies where the decision to pursue sustainability is based more on corporate values or broader issues of CSR, marketers may be handed a mandate to pursue sustainability through the revision and re-alignment of corporate strategy. Therefore, corporate strategy, culture and governance should reflect sustainability practices and socially responsible initiatives in its design and value chain. Such implemented practices and initiatives offer diverse benefits, i.e. organization identity that distinguish it from the others; a sense of identity for organizational members; greater commitment to organizational goals and objectives; acceptable behaviours and attitudes of employees in making decisions and solving problems; and stability of social systems. Stability could be achieved through the corporate culture as it has significant influence upon its employees. Their perceptions of CSR activities play an important role in affection towards their organization as well as corporate performance. Organizational culture is crucial in understanding employee behaviour and their involvement in the creation of it. Marketing culture, as an element of organizational culture, encompasses external behaviour and relationships with the environment, as the very purpose of marketing reflects the environment orientation, i.e., focus on customer with the intention to seek beneficial objectives for the organization. Therefore, this research emphasises communication as a very important aspect of marketing culture within a CSR framework contributing to the responsible decision-making. Companies supporting open communication as the key value of marketing culture have a strong marketing culture, because information circulates in the entire organization and becomes not only the responsibility of marketing managers. Employee responsibility as a value of
marketing culture enables decentralized decision process, thus making the influence of authority and hierarchical levels less important and facilitating the market orientation processes.

Further research should aim to find the relationships between organizational/marketing culture and corporate social responsibility. Organizational and marketing culture changes over time and possible consequences on corporate social responsibility should be studied.

BOOK OF CONFERENCE ABSTRACTS
NEW ROLES AND TRADITIONAL EXPECTATIONS – ACADEMIC LEADERS IN EIGHT EUROPEAN COUNTRIES

Aarrevaara, Timo

University of Helsinki, Finland

ABSTRACT

The structural changes in public organisations have resulted in a development path which requires staff with a leadership role to carry out the reforms. This has been reflected in Finland within its universities, which transferred from direct government control from the beginning of 2010. At the same time, it has led to a contradictory entrepreneurial culture and bureaucratic processes in university decision making and operations. This is because the universities are still largely government-funded organisations with a financial system in which academics are subjected to market forces and competitive funding schemes. However, the types of entrepreneurial practices required of academics and the style of new leadership are not clear.

For example, government productivity programs are based on increasing performance expectations with fewer staff resources, but at the same time there has been a restriction of the traditional role of academic leaders. Implementation of the changes occurred first of all for the leaders, who are also responsible for operational performance. In this way the changes are taking place at universities outside the leaders’ regular work load. In this regard, it is evident that the disengagement in state universities has meant the erosion of academic leaders’ authority. The question is how academic leaders can enhance their role as managers.

This presentation raises questions about the type of operational principles academic leaders hoped for, and the role they aspired to for themselves. Although the presentation concerns universities, the cases presented show a more general role in public and private leadership. The main themes of the presentation are the content of work; the skills academic leaders require; changes in the leadership role; differentiation from the traditional profession; and professionalism as a requirement for those occupying academic managerial posts. The presentation also looks at examples of leadership changes. The data are based on the 11,900 European responses to the Changing Academic Profession (CAP) survey (2008-2011), and 60 interviews of Finnish academics conducted in 2011 as part of the EUROAC project that was conducted in eight European countries.

MOBILE MARKETING: FUTURE'S PROMOTIONAL CHANNEL

Amirkhanpour, Monaliz

Faculty of Business, Education & Professional Studies (BEPS), University of Gloucestershire, UK

ABSTRACT

The purpose of this research is to investigate the role and importance of mobile marketing. This will be achieved by theoretically defining mobile marketing; exploring its significance in adopting a multi-channel marketing approach by marketers and business owners; investigating its role in integrating with social media; and proposing a conceptual framework towards its utilization in the wider strategic marketing context.

Mobile marketing has emerged as a new addition to the portfolio of marketing communication tools. Every day more businesses are incorporating mobile marketing into their marketing mix in order to communicate effectively with their customers. The main purpose of mobile marketing is to increase the awareness level of the businesses by assisting them in gathering relevant information about the needs and preferences of their target customers in a timely and profitable manner.

Entering the mobile channel requires a high-level strategic plan. Mobile strategy is the framework that defines how various mobile tactics such as mobile websites, mobile apps and other mobile marketing communication tools are used to satisfy the customers’ needs and achieve the specified marketing goals. Furthermore, a successful mobile strategy depends on a harmonious balance between: (1) the brand, (2) the customers, and (3) the environment. The brand, the customers, and the environment have identical importance in a mobile strategy; however, a successful mobile strategy is one that is uniquely customized to the specific brand and the target customers.

From a methodological perspective, the research is based on theory at this stage of development and it is enhanced by secondary data. Theoretical considerations from the literature are further conceptually developed to construct a mobile marketing provisional framework towards empirical validation.

Taking the research studies on mobile marketing into careful consideration, it is evident that there is a lack of awareness and knowledge among marketers that plan to adopt and integrate mobile marketing into their direct marketing communications. This is due to the limited number of research studies exclusively dedicated to mobile marketing communications using smartphones and tablet PCs. With the rapid mobile technology developments, marketing through the mobile channel is getting pervasive and not negligible in the upcoming years. Therefore, to entirely adopt mobile as a new element of the marketing mix, marketers are required to evolve along with it. Otherwise, they will gradually lose a large number of customers who are mobile.
Consequently, it should be taken into consideration that mobile marketing opens new horizons for businesses and marketing managers which will ultimately result in increasing sales and consumer traffic, driving offline sales up by incorporating location-based search strategies, and building customer loyalty and trust by asking for their permission prior to initiating a marketing dialogue with them. The research outcomes do add to the growing knowledge concerning mobile marketing and set the basis for a more refined understanding through a more comprehensive perspective on the topic.

"ELICITING INDIVIDUAL PREFERENCES FOR IMPACT AND SocialLY RESPONSIBLE INVESTMENTS"

Apostolakis, George¹; Kraanen, Frido²; van Dijk, Gert¹²

¹Nyenrode Business Universiteit, Breukelen, The Netherlands
²TIAS School for Business and Society, Tilburg University, Tilburg, The Netherlands

ABSTRACT

Impact and socially-responsible investments have increasingly gained momentum over the past few years. Institutional investors, such as pension funds, are proactively integrating such practices into their investment strategy as they realize that sustainability and social responsibility are part of their fiduciary duty (Koedijk and Slager, 2011). Nevertheless, the preferences of pension funds’ beneficiaries that investments should meet such criteria, have not been sufficiently investigated yet. The literature suggests contradictory findings about the financial performance of such responsible funds compared with the conventional ones in the long run and therefore concrete conclusions cannot be established yet. However, we may argue that responsible funds have greater administrative costs over the conventional ones. Therefore our research objective is twofold: first we seek to answer the question to what extent individuals would sacrifice a small part of their expected pension income in exchange for investments which add social value. Second, we aim to examine whether individuals are capable of making consistent choices with regard to investment decisions that affect their well-being. In this study, which is based on a discrete-choice modeling framework, we present how members of a Dutch administrative pension organization make trade-offs between different investment criteria such as Impact Investments (Iml), Socially Responsible Investments (SRI), Social Initiatives (SI), and their willingness to accept a lower pension in the selection process of a responsible investment portfolio, given the opportunity of such a choice.

The framework to elicit individuals’ preferences is based on the random utility theory (see (McFadden, 1986; Louviere et al., 2000)). Empirical data for this study was collected from individuals who work in the care and welfare sector in the Netherlands, using a web-based discrete choice survey. Each survey instrument contained 10 choice profiles and compared 4 attributes of 2 different responsible investment portfolios. The attributes varied from 2 to 10 levels according to a full profile choice-conjoint design.

The result of the analysis, of the Hierarchical Bayes (HB) regression models, shows the relative effect of Iml criteria, SRI criteria, SI and the willingness to accept a lower pension on the selection of a responsible investment portfolio.

This article also presents our findings with regard to the construal level theory and the psychological distance theory Trope and Liberman, (2010). Liberman et al., (2007) argue that although a greater
psychological distance is associated with more desirable outcomes, in the end, individuals are more likely to implement the closer in distance outcomes, considered being more feasible. Thus, we construct measures of the temporal, special, social and hypothetical dimensions of the psychological distance toward responsible investments. Several policy recommendations stem from our research: different strategies can bridge the psychological distance gap; framing, nudging, communication strategies and the improvement of the financial knowledge are only a few of the strategies that aim to transcend behavioral biases.

ORGANIZATIONAL INTERVENTION FOR INCREASING INTERPERSONAL INTERACTIONS AND CREATIVITY

Arieli, Sharon1; Rubel – Lifshitz, Tammy2; Elster, Andrey1; Sagiv, Lilach1; Ekelund, Bjørn Z.2

1The Hebrew University of Jerusalem, School of business Administration
2Human Factors, AS

ABSTRACT

Organizations encourage their employees to engage in practices that increase performance and facilitate the achievement of their business objectives. In this research we focus on interpersonal interactions and creativity, which are often associated with personal and organizational successes. The current research experimentally examine whether these types of behaviors are malleable and can be shaped by organizational intervention. We suggest that a 2-hour intervention, which evokes openness to other people and ideas, can change the way individuals think about others, and perform creatively. This research question was tested using an organizational intervention named Diversity IceBreaker that was developed by Bjørn Z. Ekelund, and was successfully implemented in multiple organizations in Europe and the US. The intervention creates a non-judgmental environment that emphasizes the advantages of diversity in personality types, through self-revealing and humoristic interpersonal interactions (Ekelund, 2010). We hypothesized that the intervention: 1) will amplify positive emotions, decrease negative emotions, and increase trust (Study 1); and 2) will facilitate creativity and awareness for social identity (Study 2).

In Study 1, 211 Israeli undergraduate business students were invited to take part in a workshop on interpersonal communication for partial course credit. They were assigned to eight groups in which they experienced a 2-hour intervention. The participants completed a short questionnaire at the beginning and at the end of the intervention, including measures of positive and negative affect (PANAS, Tellegen, Watson, & Clark, 1988), and trust (adapted from Yamagishi, 1988). As hypothesized, positive affect increased and negative affect decreased following the workshop $t(210)=2.42, 2.56$, both $p<.01$. Also as hypothesized, participants' trust increased following the workshop $t(210)=1.86, p<.05$.

Study 2 focused on creativity and social identity, and included 82 participants, who were assigned into four workshops. The order of the creativity task versus the identity task was manipulated: Participants were randomly assigned into “creativity-first” versus “identity-first” condition. Creativity was assessed using a divergent thinking task (Wallach & Kogan, 1965). As expected, the ideas provided by the participants after the workshop were more novel than those provided prior the workshop $t(79)=2.11, p<.05$. Identity was assessed using the Twenty Statement Test (Kuhn &
McPartland, 1954). Also as hypothesized, participants described themselves more in relational terms after the intervention than prior to the intervention \(t(79)=1.95, p<.05\). Importantly, the extent to which participants described themselves in individualistic terms did not change following the workshop. Thus, the workshop simultaneously facilitated both autonomy (leading to personal creativity) and social engagement.

In sum, a 2-hour intervention which created a friendly and open atmosphere increased individuals' trust and affective well-being (Studies 1-2) as well as their creativity and relational identity (Study 2). The experimental setting enabled us to establish causality and assure that this intervention has an effect on participants' affective well-being, creativity and identity. Future research could investigate the resistance of these effects over time, and try to replicate them in real-life organizational settings.
SERVITIZATION: A CONTENT ANALYSIS AND EVIDENCE FROM MOBILE PHONE INDUSTRY

Augurio, Alessandro; Castaldi, Laura; Turi, Claudio

Department of Economics, Second University of Naples, Capua, Italy, e-mail:

ABSTRACT

PRINCIPAL TOPIC

One of the most important phenomena of modern economy is servitization, conceived as the impetuous advance of the service sector compared to agriculture and manufacturing industry. On the supply side, the servitization is the evolution of the offering from a simply material product to one that is inseparable from services (Vandermerwe and Rada, 1988). Indeed, the increasing importance of services has been pushing the firms to offer a product-service system (PSS) (Baines et al., 2007), made of a variable mix of tangible (the product) and intangible components (a mix of services), both of them fundamental for the generation of value.

MAIN PURPOSE

The aim of the study is to investigate the phenomenon of servitization through an in-depth activity of literature review, using the content analysis technique, and a survey of the mobile phone industry. The choice of this industry is due to the great importance that services have been taking during the last years.

Today’s handsets are not simply traditional phones but better mobile computing platforms for voice communication and content and services fruition, i.e., what has been named a mobile ecosystem (Mitchener, 2009). This is moving competition from physical attributes (e.g., handiness, battery life, signal reception, etc.) to soft components of handsets (operating systems, online marketplaces, graphical user interfaces) and, on demand side, it is allowing vast personalization of devices’ functional capabilities.

METHOD/STRUCTURE

The work is organized as follows.

The first part consists in a systematization of the literature about servitization using content analysis. This research technique, reducing a complex phenomenon in a set of defined categories, facilitates its analysis and interpretation (Harwood and Garry, 2003). In particular basing on an initial - general and
ample - literature review, the content analysis is carried out considering the most influential international works, selected according to the impact factor of the journals they were published by. The second part of the work analyses how servitization, enhanced by the introduction of the iPhone and the lunch of the App Store, has changed the mobile phone industry both on the supply and demand sides.

FINDINGS

The work carries out an overall and unitary analysis of the most important studies about servitization, analysing meaning, defining characteristics and effects of the phenomenon. This should permit to draw useful managerial implications, mainly regarding the development of new capabilities necessary to run the transition from the product to the PSSs (Oliva and Kallenberg, 2003). Then, moving from theory to practice, the study focuses on the mobile phone industry and analyses how it has been changing from a product-oriented industry, where the value of the offering was strongly dependent on the characteristics of devices, to a service-oriented industry, where handsets are mobile platforms used to access a large choice of services. As a consequence the value chain has been changing, centring on users who can define, thus personalize, the characteristics of their devices, and shape them on their exact needs.

This has made the offering more customizable and complex than in the past, asking firms for the aforesaid competence development and consequently for organizational changes.

**Keywords:** Servitization, mobile phone, value chain.

AN INQUIRY REGARDING THE IMPLEMENTATION OF INTELLIGENT SYSTEMS IN LOGISTICS NETWORKS, NECESSARY FOR SOCIAL INNOVATION

Balint, Antoniu Ovidiu; Burghelea, Cristina; Gheorghiu, Anca

1Business Administration Doctoral School, The Bucharest University Of Economic Studies, Romania
2Hyperion University From Bucharest, Romania

ABSTRACT

The history of human premises is accompanied by researches and confrontations generated by human groups that attempted to find and provide favorable living areas, to serve their needs and interests determined by their needs of life. Thus, we can talk, compare and analyze different economic indicators like developed and undeveloped regions, poor and rich regions, agricultural and industrial regions, urban and rural areas. Differences and discrepancies that are more obvious in economic terms between regions on a global, continental, regional, national and even sub national scale are creating economic inequalities and the improvement of the standards of living together with the deterioration of the natural environment represent the major challenges of the current technological civilization (Mulgan, 2006).

The content of this paper is focused on the implementation of Intelligent Systems (I.S.) especially Intelligent Transport Systems (I.T.S.) in logistics projects that are necessary for the development of social innovation, which transfigures the interactional approach to all phases and stages of projects involved in the logistic process. This includes the structuring of design, analysis, strategy, planning, financing and completion of projects, creating conditions for interconnections of all activities involving logistics projects in a primary flow, towards all operations, actions and phases of the implemented projects, forming secondary logistics projects involving resources, time and costs of the initial project.

Regional development projects or secondary logistics projects represent the tools by which local authorities or local companies initiate the implementation of economic or industrial objectives, in accordance with the regional strategies, plans or programs needed for regional development or social innovation. Regional development or social innovation through projects allows rational allocations of funds and effective allowance of the local resources in accordance with the development priorities of the regions or with the regional policies (Mulgan et al., 2007).

In terms of regional development in the European area especially in the European Union (E.U.) zone, transnational and multi-sector projects require the use of design tools and network interconnections between different elements and components of the regional European areas (population, economic
and financial potential, social and cultural indicatives etc.) requiring the taking into account of the capacity of these tools to analyze, schedule and implement these projects ensuring the necessary objectives required for all problems faced by regions: inequality, pollution, poor technology, administrative distortions, inadequate infrastructure etc.

The projects promoted by the E.U. provides all the methodology and all the necessary logistics systems and also the operational factors needed for proper implementation of the regional objectives developed in various areas while the regional and rural areas targeted by the governmental authorities have been given more attention and interest necessary to achieve these projects (Mortensen et al., 2002). The principles, objectives and criteria for the selection of joint-projects that are implemented at a regional and/or local area allow the E.U. to harmonize and link the financial efforts that are focused on areas that need developed to the logic of concentric priorities according to three criteria: the type of project that needs to be implemented, the nature destination of the founds and priority investment in certain projects that are needed by the local community.

Regional development projects that have a deep impact on the bioeconomic environment at a local and regional area can be improved with the help of Intelligent Systems (I.S.) and especially with the help of modern logistic networks that are used and are implemented as a coherent and unified system within the European area as a priority to unify the diversity of differentiated regional and local (urban and rural) systems in all states in the E.U. and at all levels providing premises for success and performance of these projects.

The regional development programs needed for social innovation and stimulation of the bioeconomic environment that are promoted by the E.U. were decisively marked by the establishment, development and expansion of the E.U., which has passed through the institutions, bodies and gradual convergence of principles, objectives and instruments of European regional development strategies and policies.

In our opinion, at the present time, Europe is faced more and more with disparities at a regional level which is influencing the economic development, traditions and the mentalities of the local population which have a deep impact on the social and institutional structures that are specific to each region; all these discrepancies must be harmonized, in an effort to create a common European space, fairly accessible to all inhabitants within the E.U.

CORPORATE SOCIAL RESPONSIBILITY AND CROSS-CULTURAL SENSITIVITY: MODELING THE TEACHING EFFECT ON INTERNATIONALISATION

Belyaeva, Zh.S.; Zvereva, O.M.; Beliaeva, V.S.

1Graduate School of Economics and Management, Ural Federal University (Russia)
2Institute of Radioelectronics and Information technologies– RTF, Ural Federal University (Russia)

ABSTRACT

The concept of corporate social responsibility as a key to future sustainable strategy is widely used in the most innovative corporations, advanced economies countries and Universities. Starting from 50s of the last century the corporate world have tried to tailor or to neglect different models of economic, social, legal and philanthropic vectors to reschedule their strategy to be responsible, sustainable and paying the investments back. Although social investments and social entrepreneurship are becoming a hot topic, we found that there is a literature gap in finding, what are the key competences to prepare and form successful entrepreneur in regards to global education internationalization and socializing imperative in international business.

We assume that the portrait of the innovative entrepreneur corresponds to a model combining leadership skills, social responsibility and cross-cultural awareness, which would be based on international peculiarities of legal, social and economic systems. On the other hand, the realities of today incorporate IT competences and creative/innovating thinking, which all together contribute to business sustainable development because it potentially has positive effect on both personal and/or corporate financial and social outcomes. One of the most important challenges calls for a specifically tailored learning programmes at Universities, while the growing number of CSR related schools, sustainable management for industry courses obviously retreats the urgency. This type of innovation also contributes to business sustainability. However the specific effect on these outcomes can be highly influenced by the national context in which the “cohort” of participants develops their activities.

METHODOLOGY

Based on the described above approach we have developed short summer programme “Sustainable Business Development: IT, Innovations Strategies”. After pre-selection process accepted participants are asked to prepare a presentation on their vision of CSR in their countries and creatively present it at the beginning of the summer school. On the first day of the school, the participants are divided into 4 groups: Industrial Business (employers), Government (regulators), Universities (educative structures and science), Service Sphere (Consulting Companies). Using an institutional approach and employing a
sample of 120 participants, we study whether national institutional conditions impose a moderating effect on the relationship between different layers of education system and thus surplus knowledge driven strategy ambitions for the future top-managers. We also have examined the effect of short programmes on the internationalization of Universities as a side-effect. The first objective was to develop a scale that enabled the measurement of students’ sensitivity to sustainability and hence, effectiveness of programmes. We aimed at measuring 3 types of Russian and international students – young managers with 3-8 years working experience, students studying economics and management, and students studying technical sciences. To measure the extent to which an individual values corporate social strategy before and after programme, in other words Education Programme Effectiveness, a forty-five question survey instrument was developed, which consisted of the following three sections aimed on understanding of programme demand for students, business structures and University. The first unit of questions aimed to measure students’ sensitivity to corporate social performance; the second captured cross-cultural sensitivity to internationalized education programmes at home and abroad; and, the third was used to collect demographic characteristics. In developing the survey, we have discovered an important detail in regards to testing the teaching effect of the short programme in a foreign language. The questionnaire was revised to leave 35 questions. We attempted to assess the effectiveness of programs in the development of the internationalization of education at the university (first unit), and susceptibility to social responsibility (second unit), and cross-cultural tolerance (third unit). We have studied the following types of sample: participants of the summer school (Russian and foreign, both technical and economic education profile) – 36%, foreign university students who have not participated in the thematic school – 10%, Russian university students who have not been involved in summer school, – 54 %. Although the sample is not highly representative for complex statistical analysis so far, we have rather interesting preliminary results.

SOME PRELIMINARY RESULTS

The first group of questions gave some contradictory results. The respondents would be very interested in interdisciplinary master programmes taught in English, although only 20% would stay at home University. The second group – about 84% would not work for a company with bad CSR-reputation, but the wage would change mind of a 41% of those. Of course we had clear difference between those who attended the school, it turned out that the students hardly know (or think) about volunteering-possibilities, and also a lot of them have no idea what is social responsibility today. 53% consider CSR as a charity action. Since the majority of respondents were males, the women’s rights issues are less important than the issues of minorities and people with disabilities. The third unit of questions indicates cross-cultural tolerance and interdependence: the respondents are very open to the people of
other nationalities and cultures; they are not ignorant to non-native speakers of Russian. A sufficient number of respondents would like to live and work abroad, but most prefer just to travel there for short vacations. It is interesting to see the significant difference between Chinese and Papua New Guinea students who are enrolled to UrFU, but were not participating in the School described above.

DISCUSSIONS AND FURTHER RESEARCH

The present paper opens perspectives to systematize the evaluation system of internationalization of education programs at UrFU, and also the development of statistical and marketing tools to develop a comprehensive strategy to enter the international education market. Obviously, these short programmes contribute to the growth of interdisciplinary competences in the field of economics and management, information technology, responsible leadership and intercultural communication. The main aim of this framework is to help students appreciate the wide-ranging perspectives on sustainability; to get them thinking about what the different “flavors” of sustainability mean for organizations – the structural and cultural implications; to critique how different organizations approach sustainability; to debate the different solutions and business cases for organizations pursuing sustainability; and to consider the wider macroeconomic implications of corporate sustainability. The authors have found that this framework generates a good deal of class discussion because it counterposes different sustainability perspectives with the neoclassical “business-as-usual” thinking that underpins the possible education programme at UrFU. Our results show that regulatory and normative dimensions do not have the same influence on that relationship, creating implications for academia, managers, and education policy makers.

EVALUATION OF INNOVATIVE CAPACITY OF A RUSSIAN HIGH-TECH PHARMACEUTICAL ENTERPRISE AND ITS POTENTIAL FOR INNOVATION

Bengoa, Dolores S.1; Alenina, Karina A.2; Vlasova, Yuliya3

International Business School at Vilnius University, Lithuania
Higher School of Economics – Perm Branch, Russia

ABSTRACT

There is an imperative need for companies to remain dominant in the pharmaceutical market. Challenges like the high speed of global business development, strong competition or economic powers are setting the standards too high for the pharmaceutical businesses. In order to achieve this competitive sustainability companies have to provide the best of their human capital and technological resources to reach great innovation levels.

According to McKeown, (2008) innovation relates to the use of more effective and efficient ways for making an invention or an idea valuable, but also, enforcing an invention for monetary or economic gain. Over the years, innovation has seen nations, regions, and economic entities developed at a greater scale due to increased efficiency and productivity (Filho, 2005). There are various factors on a macro and micro level that influence the degree of innovation in any given business organization or even affecting the entire industry. Those include changes in the business environment, changes in the structure of markets and market forces affecting more the macro level and, the level of education and scientific knowledge in an organization, research and development of skills within the workforce, and changes in the business culture and beliefs within the society, affecting more the micro level.

Pharmaceutical’s innovation has been the lion’s share in the pharmaceutical sector for many years around the world (Dubey and Dubey, 2010). Most probably because the pharmaceutical industry “stands at the center of the health of nations, rich and poor nations alike” as Rao (2008, p.103) explained. Nevertheless, there is a current decline success rate in the pharmaceutical industry due to a number of reasons: reduce number of new product approval, an increase in the costs of innovation, long research and development cycle and potential patent expiration (Dubey and Dubey, 2010; Huang, 2012) impacting on the overall pharmaceutical growth.

The paper explores reasons and motives that positively influence the innovative capacity and the potential for innovation in the Russian pharmaceutical market.

The paper begins with a review on existing literature in the field of pharmaceutical and innovation. It addresses in a detailed manner the reasons and factors which determine the innovation capacity and the potential for innovation of pharmaceutical firms. It continues with the research methodology and
finally, the third part entails the presentation and discussions of the results obtained from the study, drawing some conclusions, recommendations and suggestions for further research.

The study adopts a case study research design and uses both primary and secondary data. Primary data was obtained from questionnaires administered directly and through email to various Russian high-tech pharmaceutical enterprises. A total population of 100 respondents is targeted. Stratified and simple random sampling techniques are used to select a sample size of 50 respondents. The data is to be analysed through descriptive statistics and later presented in frequency tables, graphs and computed percentages.

The applicability of this study might contribute with regional economists, practitioners, analysts, policymakers, government agencies and investors who will be able to determine whether their investments are operating optimally and also to scholars and researchers since there is a lack in literature in this specific field and concretely in the Russian market.

The study identifies that a broad working experience has the tendency to increase the innovative capacity and potential for the innovation of the high-tech Russian pharmaceutical enterprises. Access to education increased the knowledge base of the staff members and, hence, the level of innovation. Allocation of resources for innovation is important for any pharmaceutical enterprise aspiring to increase its innovative capacity and potential for innovation.

Based on the findings and conclusions of the study, the researchers recommend that management should ensure that they minimise employee turnover to increase the skills of the employees, with the hiring of staff to be done based on academic qualifications. Additionally, monetary and non-monetary resources should be allocated evenly for innovation purposes.

HANDLING DIFFERENT MANAGERIAL LOGICS IN THE PUBLIC SECTOR: A TALE FROM THE LAND OF THE FJORDS

Berg, Laila Nordstrand

Department for political science and management, Faculty of economics and social sciences, University of Agder, Norway

ABSTRACT

In Norway, as other western countries, the public sector has been facing administrative reforms influenced by New Public Management, NPM. The ideological foundation behind NPM asserts that the sector can improve by introducing managerialism, technology and values emanating from the private sector (Pollitt & Bouchaert 2011). The NPM-influenced reforms are taking different trajectories in different countries, but their purposes and approaches are rather similar: 1) increased efficiency, 2) enhanced accessibility for clients/users, 3) reduce public consumption, and 4) increase managerial accountability (Christensen & Lægreid 2011). This paper focuses on the last aspect, i.e. on how managers are dealing with new institutional frameworks introduced by reforms. Management – or the lack of it- is both seen as one of the problems in the public sector, but also as a solution to the different problems facing the sector (Degeling & Carr 2004).

A comparative approach is chosen, by analyzing management in two different sectors in Norway, the hospital and the higher education (HE) sectors. In the hospital sector, a particular focus is given to the management reform leading to the introduction of unitary and professional neutral management (HOD 1999). One particular feature of this reform in Norway is that nurses can now become leaders, thus supervising the activities of medical professionals like doctors. In addition, a second reform process is also taken into consideration (HD 2001), namely, the one transferring the ownership of Norwegian hospitals from the counties to the state, which resulted in the introduction of new organizational structures and, in turn, changed the hospitals from public administrative bodies into public enterprises. When it comes to the HE sector, the starting point for our analysis is that of the 2003 Quality Reform which included many aspects associated with NPM, namely: a strong emphasis placed on quality, accreditation and accountability; changes in the distribution of public funding towards teaching and research (with a performance element); efficiency; the rise of ‘strategic science’ regimes (e.g. centers of excellence and innovation); and the institutionalization of a professionalized managerial structure (in tandem with traditional academic structures) within universities. These ‘innovations’ have, amongst other things, led to stronger rationalization, increasing competition, and the centralization of decision making procedures, thus setting in motion a series of related tensions.
and dilemmas around the ways in which HE systems and institutions are steered and internally governed.

Due to the high level of expertise and task complexity, the occupational groups in hospitals and universities are considered as professionals (Freidson 2001), which, in turn, are considered by some as the key actors of the modern welfare state (Kuhlmann 2006). In this position they are given autonomy and professional self-regulation and the right to serve clients and patients (Molander & Terum 2008). Professionals can also be viewed as political actors (Scott 2008) and have the power to acts as mediators between the state and citizens, and in this manner they can pursue their own interests and become a political problem (Abbott 1988; Freidson 1970; Larson 1977). What is more, professionals play an important role in the implementation of government-led reforms (Eymeri-Douzans 2011).

The work of professionals is embedded in the norms and values of the institutions they inhabit, but also originate from their early socialization while undertaking formal training/education (Scott 2008). Different professional types are embedded with various values and norms. This can be viewed as different “institutional logics”, defined as principles that guide and motivate actions for groups and individuals in organizations (Friedland & Alford 1991; Thornton & Ocasio 2008). Logics are historical patterns of cultural symbols and material practices that are socially constructed (ibid). Different logics can work side by side in an organization, yet more often, logics can be conflicting and competitive (Greenwood, Raynard, Kodeih, Micelotta & Lounsbury 2011). That said, within a given local setting – hospital or university - institutional logics serve the critical function of binding the work undertaken by different professionals together (Byrkjeflot 1997), thus guaranteeing a certain degree of organizational coherence albeit not always visible to the naked eye (Cohen & March 1986; Cohen, March & Olsen 1972).

In the context of this paper, the institutional logics in focus are related to professional logics, where various types of professionals have distinct ideals on how to practice management (Abbott 1988; Freidson 1994). Hospitals and Universities, as part of the public sector, are also characterized by a political logic, framed around the just access to public services (Scott, Ruef, Mendel & Caronna 2000) and the redistribution of common goods (Thornton, Ocasio & Lounsbury 2012). Administrative procedures are important to reassure equal treatment (Hood 1991; Osborne 2011). Lastly, we take stock of the effects accrued to the rise of a market logic, introduced by NPM and with emphasis on efficiency, economic control and management (Scott et al. 2000).

Given this, the paper compares the types of logics characterizing managers in the two public sectors in Norway, and thus its research question are as follows:

1. How has management in Norwegian hospitals and universities been affected by the introduction of NPM-inspired reforms?
2. How do hospital and university managers in Norway cope with (mediate between) the tensions and dilemmas arising from the interplay of the different institutional logics within their respective organizations?

These questions are highlighted by a multilevel qualitative study. Research question 1 is highlighting the system dynamics at a macro level with literature review from Norway and globally. The focus is on the effects from NPM in structural changes with consequences for leadership and organization. Research question 2 is focusing on the meso- and micro level to illuminate effects from NPM and the introduction of market logic in institutions characterized of professional logics in management. The empirical material comprises semi-structured interviews with formal leaders at different levels in the institutions. From the hospital sector, we have interviewed 18 managers in a medium sized general hospital in Norway. This is managers at the three levels below the CEO, with a general manager responsibility, sitting in profession neutral positions. The managers come from the medical and nursing profession. From the university sector, we have interviewed 18 managers, of which 8 were at the central administration (Rector, Vice Rector and Administrative Directors) and 10 were at the sub-unit level (Dean and Department Heads).

The findings from this study indicate that, across both sectors management has been introduced, but not in a pure form. The term “hybrid management” has been used to describe the combination of logics. Hybrid here indicates a combination of logics that normally are not combined under one organizational roof or sub-unit. Ironically, NPM reforms have resulted in increased bureaucracy, so hospital and university managers alike are influenced by a “neo-bureaucratic” logic. That said, the data show that the professional logics are resisting the logic of management and therefore the professionals involved (academics, nurses, doctors, etc.) are not leaving the former logic behind, but develop it further as to include the different logics within the organization and that are required to reach daily tasks and strategic objectives. In this hybridity of management, leadership and leaderism becomes important aspects. Hospital and university leaders are emphasizing the relational aspects of the roles, and leadership acts as a catalyzer to handle the different logics in management.

Key words: leadership, management, professional management, hybrid management, hospitals, higher education, Norway

CREATE, BUILD AND MANAGE ONLINE BRANDS FOR INTERNET COMPANIES

Bilro, Ricardo Godinho; Loureiro, Sandra Maria Correia
Marketing, Operations and General Management Department, Instituto Universitário de Lisboa, (ISCTE-IUL), Portugal

ABSTRACT

RESEARCH AIMS
The primary objective of this ongoing research is to identify the main assets that create brand success for internet-only companies. Based on an extensive and systematic literature review, this study seeks to identify the constructs who drive online brands for a successful life. Eighteen articles were identified and from those some preliminary reflections were taken.

BACKGROUND
As Internet usage grows, brands are becoming even more important than they have been in other channels or environments. With new options emerging every day from many unknown providers from all over the world, customers want to choose a supplier that represents a set of values or attributes that are meaningful, clear, and trusted (Kwon and Lennon, 2009). With the proliferation of products, goods and services are easily duplicated or replaceable; brands become in this vein an important asset for simplifying the decision-making process for consumers. Therefore, if we are able to properly manage this asset, then we can create difference, relevance, and affinity (Otim and Grover, 2006). In fact, one of the main factors that consumers use for first distinguishing providers is brand name, which is known to be positively related to perceived levels of brand trust (Ruparelia et al., 2010).

Stand-alone internet companies such as major players like Google, Facebook, Twitter, Amazon or eBay or even small internet businesses worldwide faces the challenge of creating, building and managing a brand that does not carry attributes or values of the physical world. Many authors support that the ease of establishing a brand and the significance of branding in cyberspace are more difficult and more important than many initially suggested (Delgado-Ballester and Hernández-Espallardo, 2008).

METHODOLOGY

Search Strategy for Quality Papers
The searches for papers with relevance for this research were made in ABI/INFORM Complete. Having as a starting point that the purpose of this Systematic Literature Review is to use only the best quality papers available were used several filters to leach the database: full-text papers, peer reviewed papers and scholarly journals criteria were selected.

In order to be able to carry out the quality journals selection, was used the Journal Quality List – Fiftieth Edition (5th July 2013), compiled and edited by Professor Anne-Wil Harzing. From this one, was chosen to use the WIE 2008 — WU Wien Journal Rating May 2008 List, which includes only A/A+ journals, and from these were considered all the journals that are under the decided scope of study.

**Scope of Study**

We selected all the papers from the following subject areas: Marketing, Entrepreneurship, General Management & Strategy and Management Information Systems - Knowledge Management. With this choice we tried to ensure that we could cover the maximum possible study areas that could address this research topic.

**Time Frame to be Examined**

For the time frame to be examined in this systematic literature it was considered the web 2.0 phenomenon as a starting point of the date range to be examined. Web 2.0 describes sites that use the technology beyond static pages from previous sites. The term Web 2.0 was proposed by O'Reilly in 2005 and it has quickly become the new buzzword of Silicon Valley, and references to a turning-point O'Reilly identify in 2004 (Constantinides and Fountain, 2007).

**SYSTEMATIC LITERATURE OUTCOME**

*Several Researches for the Literature Review*

The expressions that best defines the subject of the study were linked to "online" and "internet". Thus, it was concluded that the core of the research would take place with the keywords "online", "brand" and "internet companies". These keywords were joined by terms that reflect the scope of the study, i.e., how to "create", "build" and "manage" online brands.

This way we have reached the terms used in the five researches carried out in this literature review. The choice to perform of this strategy was taken in order to fulfil the objective of trying to include as many articles available on the subject.

*The Aggregate Outcome of the Search Strategy*

The sum of the results obtained from the literature review search is shown in Figure 1 as a flow diagram.
In this systematic literature review was created and used a data extraction form in order to extract the data from the selected papers and also to be able to document the process of data extraction. Regarding the elements extracted from the papers they were divided in three main groups: general information, study characteristics and main results. An example with three recent and relevant papers is attached as Appendix.

**PRELIMINARY FINDINGS**

At this point, we can draw preliminary findings and synthesis. As far as we can observe the Trust construct represents an important role in the online brand life cycle management, regardless we are referring to e-tailers, services providers or product supplier. In the intangible world of online brands, customers are very sensitive to the confidence on online brands and this construct can be crucial for companies to achieve success. Indeed, trust appears by far as main appraiser for online brand loyalty and customer quality judgment constructs. Other assets as consumer engagement (thru experience, habit or even through online communities) and repurchased intention motivations are not to ignore at this moment as important constructs that influence online brand management and that can lead to an...
explanatory model for the theoretical question under study. Detailed results of this research will be presented at the EuroMed 2014 conference.

ANTecedENTS AND CRITICAL SUCCESS FACTORS IN CONTRACTual NETWORKS: NEW INSIGHTS FROM ITALIAN CASE STUDIES

Cantele, Silvia; Vernizzi, Silvia

Department of Business Administration, University of Verona

ABSTRACT

Networks are motivated by, among other things, the need to improve production efficiency, share research and development skills and gain access to new markets. Each of these aspects has become increasingly important, especially for small to medium enterprises, whose resources are often significantly constrained (Ahuja 2000; Håkansson et al. 2009).

The literature on networks is vast and can be traced in both the strategic (Ahuja 2000; Barney 1991; Gulati 2007; Lavie 2007) and organisational (Grandori & Soda 1995; Knight & Harland 2005; Verwaal & Hesselsmans 2004) fields. Among the different networks’ forms and agreements, both structured and informal, we focus on a tool introduced in 2009 by Italian law to improve firms’ competitiveness and innovation attitude. The tool, named ‘contratto di rete’ (‘business network contract’) is a private agreement between two or more firms aimed at exchanging information or services, collaborating in determined fields to attain the firms’ business purposes or jointly managing common activities. The business network contract is a form of structured and flexible cooperation that allows firms to share information, resources and activities while maintaining their legal autonomy and independence. Since its introduction, the business network contract regulation has often been updated. In March 2014, registered contracts in Italy numbered 1,380, with 6,594 firms involved.

In the literature, many studies focus on the antecedents of networks and strategic alliance performance (Christoffersen 2013); however, there is a lack of consensus about what makes the business network contract effective. This paper intends to contribute to the existing literature by investigating how the antecedents blend and contribute effectively to the success of networks in realising those strategic aims not achievable by single firms. In line with the explanatory nature of our research objective, we chose a theoretical sampling case-study approach (Eisendhart 1989; Yin 1994; Siggelkow 2007; Easton 2010). We selected two network case studies: Racebo, a vertical network among producers and subcontractors for the automotive and motor industry aimed at responding to global competition and the economic downturn of the industry; and Rete per la tutela dei funghi di bosco (Safeguarding forest mushrooms network), a network among forest mushroom producers aimed at enhancing the quality of the product and improving firms’ competitiveness.

As showed in the literature concerning the antecedents of strategic alliances (Christoffersen 2013), these alliances rely on some behavioural attributes: commitment, trust and cooperation. Our research...
highlights the ways in which these attributes are connected and the other elements critical to the success of a network contract.

From the analysed case studies, we found that the commitment required by a network contract can be relatively low. All the firms agreed that the contract can produce relevant advantages for small to medium enterprises with only a small investment because its first function is to allow small firms to reach a ‘critical mass’ with respect to the different aims stated, from time to time, by the network (e.g., access to foreign customers requiring a turnkey product, dialogue with the institutions to obtain a new product’s regulation, greater power over distribution channels). The commitment can be relatively low if firms trust each other and if some operative decisions can be delegated to a charismatic leader (usually the president of the network), reducing the occurrence of deadlocks in decision making. This leadership requirement appears to be a new element, adding to those already cited in the literature, such as unequivocal power relationships (Koenig & van Wijk 2001) and control (Christoffersen 2013). The creation of trust among firms in a network is a basic antecedent of cooperation, which the interviewed firms usually relate to a willingness to share information and common management issues. This sharing is dependent on the level of transparency of the firms and is a fundamental element in the construction of the network’s strategy. Another common element emerging from the interviews was a step-by-step definition of the strategic actions of the network—a type of emerging strategy that enlarges on what the firms agreed to in the original network contract. Transparency exposes firms to vulnerability and requires an open-minded approach to business, in which the entrepreneur reduces the tendency to individualism and the fear of losing their ‘identity’ in order to reach cultural compatibility with their partners. Both case studies were characterised by the presence of second-generation entrepreneurs, an element that appears to favour a more open business culture, although only if first-generation entrepreneurs are willing to trust the younger network members.

Other relevant factors affecting network success include firms’ dissimilarities (Christoffersen 2013). The interviewed firms agreed on these propositions: size differences can be a problem in networks due to the consequent differences in investment capacity; and geographic distance can be a concern in terms of governance because it discourages participation in meetings, where strategic and operating decision are often taken. Industry relatedness is usually the impetus for a network contract because firms often form a network to collaborate, to share a common business activity and/or to solve common problems. The level of industry relatedness is connected to the competition issue, which was treated differently in each of the analysed cases. In the Racebo case, the firms formed a supply-chain network in which the presence of two directly competing firms was excluded. In the mushroom producers’ case, the firms cooperated without competitive intent, with the aims of solving a common production and product quality issue, and creating a competitive advantage for the network’s firms in order to challenge those
outsiders using ‘unfair’ competition. In both cases, the emerging idea is that the competitive advantage of the network firms defeats the companies outside the network while a cooperative intent prevails over a competitive intent inside the network (Stiles 2001). The exclusion of direct competitors from the network is a method of transferring conflicts outside the contract boundaries. Interviewed firms articulated feelings such as envy of the network firms’ success and reported the construction of an ‘invisible wall’ dividing the network from the rest of the world.

Conflict is also present inside the contract, and usually relates to a different vision of the operating solutions to reach common network purposes. Conflicts regarding these purposes are usually solved by choosing strategies on which all the network participants agree. However, a certain level of conflict is unavoidable because although network firms become part of a new collaborative entity—metaphorically referred to as a ‘flexible elephant’ (Network Case 1—Director of a participating firm)—network contracts leave the participant firms autonomous. Therefore, the governance and management of the network is based on a balance in which personal relationships play a crucial role. All of the interviewed firms agreed that personal relationships must be cultivated among network firms, and stressed the importance of informal meetings to strengthen the sense of belonging to the ‘group’. Formal and informal meeting occasions reinforce trust and create unplanned strategic opportunities that characterise a form of collaboration that is formalised but not in all the details and possible outcomes of the contract. In both analysed cases, the natural consequence of network contracts has been (or is expected to be) a merger between some of the companies, because ‘network contract is an engagement’ (Network Case 1—President of the network).

The idea that a network produces unexpected positive side effects, including a common intention to create a more competitive critical mass, could be one of the reasons why firms usually report difficulties in measuring the direct economic impact of network participation. Instead, the success of the alliance is usually measured though operating indicators, such as the concrete results of specific common initiatives, or it is described in terms of good perceptions stemming from the extrinsic evidence of ongoing participation and the commitment of the firms in the network. The research highlights a logical loop in which the different antecedents or critical success factors described in the literature are connected, as evidenced by the case studies: commitment is related to trust, cooperation and transparency, and requires some features of cultural compatibility and a certain balance in dissimilarities and relatedness; competition and conflict inside and outside the network can be managed by nurturing personal relationships; and network success measurement is not a primary issue for the analysed firms, and can be appreciated in terms of the ongoing commitment of the participating companies.

PERCEIVED BUYER CONFIDENCE IN BUYER-SUPPLIER RELATIONSHIPS

Chao, Emmanuel

Faculty of Economics and Social Science, University of Agder, Norway

ABSTRACT

Suppliers and buyers in business to business (B2B) relationships seek to build closer relationships to improve efficiency of the transactions. At the same time, they are vulnerable for potential hazards, such as opportunism. Foresighted managers are likely to choose exchange partners to whom they are confident that they will not behave opportunistically. While the notion of trust has been extensively conceptualized and analysed, surprisingly few scholars have focused on the concept of confidence and the antecedents of this in B2B relationships. Despite the importance of confidence in business relationship, very few scholars have empirically investigated the antecedents of this concept. In line with previous literature, this paper maintains that trust and control are the key sources for confidence. We use networks and reputation as indicators for trust, and ex ante contractual efforts and ex post contractual specifications as indicators for control. All these indicators have a positive impact on confidence. Trust and control seem to supplement each other as sources for confidence.

AN INVESTIGATION INTO THE IMPACT OF CORPORATE REBRANDING UPON CORPORATE PERFORMANCE IN A BOTTOM OF PYRAMID (BOP) CONTEXT: A CASE STUDY FOR TELECOM INDUSTRY IN BANGLADESH

Choudhury, Mohammad R. Uddin¹; Melewar, TC²

¹Middlesex University, London
²School of Business, Middlesex University, London

ABSTRACT

In a small developing country- Bangladesh, five companies out of six in the telecom industries did corporate re-branding in recent times. Re-branding also observed in other industries as well. Therefore, this research is going to investigate the relationship between corporate rebranding and corporate performance in a bottom of pyramid (BOP) context. In order to do that the identified research objectives are: to present a conceptual and empirical analysis of corporate rebranding in telecom industry in Bangladesh; to explore the impact of corporate rebranding upon company performance in telecommunication companies and to find out the critical factors for success or failure of re-branding in a Bottom of Pyramid context.

1. INTRODUCTION: RELATIONSHIP OF THE PROPOSED RESEARCH TO PREVIOUS WORK

In an increasingly competitive business world, survival and success depend on the aptitude to evolve gradually to meet new challenges that arise (Dubey and George, 2012). Some organizations elect to go much further and see corporate rebranding (CR) as the best way to remain competitive (Tevi and Otubanjo, 2013). Corporate rebranding is usually expressed by change of name, logo or even changes of slogan of a company. But in this modern business world it is not simply a tactical change in name or logo (Kay, 2006). It is an important marketing strategy decision of the corporation undertaken as a result of a change in the customer or employee base, new products and services or a revisited strategic position and value proposition (Cettier and Schmitt, 2008). Sometimes corporation can do re-branding for its international development and shift in emphasis from one business line to another (Melewar, Hussey and Srivoravilai 2005). Numerous prominent companies rebranded themselves such as Philip Morris, British Steel, Andersen Consulting, Silly PepsiCo, ExxonMobil and SciFi Channel etc. (Dubey and George 2012, Male, 2010, McCarthy, 2008). Cettier and Schmitt (cited above) in their study revealed that half of all rebranding activities were successful in the period 1995 to 2004. However, most of the recent corporate re-branding was unsuccessful (Male, 2010).
So, it is clear that corporate re-branding entails risk (Bravo, Montaner and Pina, 2009). That means the new brand may fail to attract new customers and potentially alienate existing ones. Despite the entailed risk corporations are involved in rebranding activities with the hope of better corporate performance. In line with the developed countries, many corporations of developing countries also rebranded in last decade (Machado, et. al., 2012). In a small developing country Bangladesh, five companies out of six in the telecom industries observed corporate rebranding in recent times. Rebranding also observed in other industries as well. The recent corporate rebranding in Bangladesh influences the researcher to undertake this study.

1.1 Rationale for this research

Previous research related to branding revealed that the consumers of developing countries, also known as Bottom of the Pyramid (BOP) customers, are not concern about the branding and corporate identity (Dubey and George, 2012). However, Companies (MNC’s and Local) operating at BOP level are focusing on branding and re-branding activities to create unique corporate identity (Machado et. al, 2012). The vast literature on brand management has largely ignored corporate rebranding. But few researchers acknowledged the importance of corporate rebranding and its entailed complexities and risks (Tevi and Otubanjo, 2013).

In the available literature of corporate rebranding researchers mainly focused on developed countries and world renowned companies (Bravo, Montaner and Pina, 2009). However, few studies are also available for developing countries (Machado, et. al., 2012) and as per my knowledge no study was conducted in the context of developing country Bangladesh. Moreover, the reasons to rebrand can come from changing external conditions, weaker competitive position, changing ownership structures and/or changes in corporate strategy (Hankinson and Lomax, 2006; Muzellec and Lambkin, 2006). All those factors are related to organizational perspective. One of the possible reasons for recent rebranding at telecom industry in Bangladesh can be changes of ownership structure. So, it raised an important research question, whether costly rebranding activities only for changes of ownership structure is helping the companies to improve corporate performance in a BOP context or not. The empirical investigation will help to develop a new theory regarding driving forces for rebranding and subsequent corporate performance in the context of developing country. It is yet to be identified that which factors influences the company to be rebranded though they are operating at BOP level and what are the driving forces for success and failure of rebranding activities in a BOP context. Therefore, the researcher is interested to explore the organizational perspective of rebranding for telecom industry in Bangladesh which will contribute to the literature by developing a comprehensive framework for rebranding at BOP context.
1.2 Research Objectives and Questions

1.2.1 Objectives

• To present a conceptual and empirical analysis of corporate re-branding in telecom industry in Bangladesh.
• To explore the impact of corporate re-branding upon company performance in telecommunication companies.
• To find out the critical factors for success or failure of re-branding in a Bottom of Pyramid context.

1.2.2 Research Questions

i) Are the main reasons for corporate rebranding in telecom industry in Bangladesh different from developed countries?
ii) Is there any long-term impact of corporate rebranding upon corporate performance for the organizations operating at telecom industry in a country of BOP consumers?
iii) What were the critical factors behind the success and failure of corporate rebranding in BOP level?

2. METHODOLOGY

Glaser (1992), defines methodology as the theory of methods and gives an insight to the audience to gain better understanding of past research and give basic idea on how to proceed in future (Gammelgaard, 2004). In the 20th century, qualitative research has not received widespread use and acceptance. However, today the use of qualitative research is increased as a result of inefficiency in quantitative research. The aim of qualitative or interpretive studies is to reveal subjectivity, complexities, nuances, uniqueness and details that are usually ignored in quantitative studies (Klein and Myers, 1999; Mason, 2002). At the same time, qualitative results frequently express verbally the interpretation of something into text which could create an understanding of relationships or complex interactions.

To accomplish the aim of this research and to answer the research questions, the researcher has opted for a qualitative methodology by adopting a case study method to gather rich information and an insight into the phenomenon. According to Denzin and Lincoln (2005) qualitative research means “a situated activity that locates the observer in the world. It consists of a set of interpretive, material practices that make the world visible”.

2.1 Research Strategy: Case Study

This research adopts a case study strategy for the study. Eisenhardt (1989) stresses that “the case study is a research strategy which focuses on understanding the dynamics present within a single setting”. It is been proven from past research that case study can be used in both qualitative and quantitative research (Yin, 2009; Yin, 1994; Eisenhardt, 1989; Ellram, 1998). Case studies are often recommended for
exploratory and theory building research (Eisenhardt, 1989; Handfield and Melnyk, 1998; Yin, 2009). Yin (2009), explains a “case study is an empirical inquiry that investigates a contemporary phenomena in-depth and within its real life context, especially when the boundaries between the phenomena and the context are not clearly evident”. Therefore, the use of case study strategy in understanding the rebranding and corporate performance relationship in the Bangladeshi telecom industry context is justified.

Regarding the number of cases in a case study, there is also an overlapping argument whether to use single or multiple cases. This actually relates with what generalisations can be drawn from case studies. Both Eisenhardt (1989) and Yin (1994) suggest that one or many cases can be included in a case study. Yin (1994) and Irani et al. (2008), for example, claim that there is nothing wrong in using one case in case study research because “one can often generalise on the basis of a single case” (Flyvbjerg, 2006). Other researchers, such as Ellram (1996), claim that a single case is used to “test a well formulated theory, an extreme or „unique case“, or a case which represents a previously inaccessible phenomenon”. However, in this research, the researcher believes it is good to have multiple cases in order to gain rich data about the rebranding and corporate performance relationship for theory building and replication purposes (Eisenhardt, 1989; Miles and Huberman, 1994 and Yin, 2009).

It is significant to note that in order to perform a qualitative case study research it should be guided by case study protocol as suggested by past researchers (Eisenhardt, 1989; Rowley, 2002; Yin, 1994). This protocol needs to include an overview of the project, field procedures and case study questions (Rowley, 2002). The next section will discuss this in detail.

2.2 Case Study Protocol

Case study protocol is a set of guidelines for performing research which aim to summarise the constructs of the conceptual model (Eisenhardt, 1989). It has been identified as a key approach of increasing the reliability of case study research and is intended to guide the researcher in carrying out data collection. Ellram (1996), in a similar argument, explains that description of the data collection in a thorough protocol will increase the reliability of the research project. For the purpose of this research, a well-established methodological guideline is adopted, as suggested by Eisenhardt (1989), Flynn et al. (1994), Meredith (1993), Voss (2003), and Yin (1994) in order to increase validity of the research findings. According to Eisenhardt (1989), case study protocol is divided into three phases. The researcher will follow these three steps in conducting this research. The first phase is known as getting started where, at this phase, it includes the process of selecting the case and crafting an instrument protocol. In phase two, known as entering the field, data collection, analysis of the data and shaping the propositions is completed. In phase three, which Eisenhardt (1989) named as reaching
closure phase, it represents enfolding the literature. In other words, at this stage, the researcher makes comparison with conflicting literature and comparisons with similar literature. Also, at these phases, theoretical saturation will be reached when the researcher discovers that every respondent says the same thing and, at this stage, closure of the case study research is reached.

However, stage two starts with the primary data collection through interview. Interview is a purposeful conversation between two or more people (Kahn and Cannell, 1957) where the interviewer directs the interview and the interviewee, known as the respondent, responds to the questions of the research (Easterby Smith et al., 2008; Robson, 2002). Interviews help the researcher to obtain valid and reliable data that are pertinent and relevant to the research questions and research objectives. The primary data collection method in this research is semi-structured interview conducted with five organisations (out of six organizations in telecom industry five organizations rebranded) along with observation and document review. These 5 organisations represent 5 case studies.

In this research, the cases are selected based on a purposive sampling technique. A purposive sampling technique enables the researcher to select cases that will best enable researchers to answer the research questions and research objectives. This type of sample is frequently used when working with small samples such as in case study research and when the researcher wishes to select cases that are particularly informative (Neuman, 2005; Saunders et al., 2009).

2.3 Research Design

It could be concluded that the researcher designed this research with critical flows; taking into consideration the issue of rigour and trustworthiness in this research as it is emphasised that rigour is significant to both qualitative and quantitative study; it is important to note every process involved in performing this research. The flow of the research design taken in this research is literature review; develop proposition; develop conceptual model; exploration to the field, validating and improving the proposed model; sampling; designing case study protocol; research process; data collection; data analysis; trustworthiness of the research; revised propositions and revised model etc.

2.4 Data Analysis

2.4.1 Transcribing the Qualitative Data

In this research, before the data is analysed, the researcher firstly transcribed the data from the interview from the recording (Saunders et al., 2009). The interview is audio recorded and subsequently transcribed which reproduces a verbatim written (word processed) account. As claimed by Saunders et al. (2009), the transcribing process is about not only being interested in what participants said, but also the way they said it. In this research, the task of transcribing the data from recorded to written text took much time because not only the words but also the tone of what is said is
transcribed; in addition the participant’s non-verbal communications are recalled. It needs to ensure that it can be linked to the contextual information that locates the interview.

2.4.2 Qualitative Data Analysis

It is recognised that all qualitative data analysis including case study should follow a general analytic strategy, which defines priorities for what to analyse and why (Yin, 2009). It is similar to what has been proposed by Miles and Huberman (1994) and Silverman (2005). It should be noted that a helpful starting point is to play with the data. Yin (2009) and Miles and Huberman (1994) set guidance in order to comprehensively describe and summarise the data from the fieldwork. They are, for example, to put the information in different groups; make a category and place the evidence within categories; create data displays such as flowcharts or graphics to examine the data; tabulate the frequency of different factors and see the relationship among factors. In this research, data analysis will be started within the case analysis and follows with cross-case analysis. Each of the findings will be explained properly. There are approximately 15 methods of analysing qualitative data and this research adopts qualitative content analysis or thematic analysis. It has been chosen as it could determine the effect of the findings through the development of the research proposition as a result from having reached saturation for every code.

2.4.3 Qualitative Content Analysis

Qualitative content analysis, also known as thematic analysis, is one of the popular methods in analysing qualitative data. It is an interpretation method for qualitative interviews (Kolbarcher, 2006; Zhang and Wildemuth, 2006) which involves activity like summarising raw data into categories or themes based on valid understanding and interpretation. This process uses inductive reasoning, by which themes and categories emerge from the data through the researcher’s careful analysis and continuous comparison. Also, importantly this process should not exclude deductive reasoning, where a deductive thematic analytic approach is also useful in this process (Miles and Huberman, 1994; Patton, 2002). According to Hsieh and Shannon (2005), there are three approaches to qualitative content analysis, namely, conventional qualitative content analysis, directed content analysis and summative content analysis. However, in this research eight steps of qualitative content analysis (Zhang and Wildemuth, 2006) will be followed.

2.4.4 Strategies and Techniques Use in the Qualitative Data Analysis

This research will use two general strategies as proposed by Yin (2009): developing case description; and relying on theoretical proposition. Data analysis will be started with a case by case analysis, also known as within case analysis. The cross-case analysis will also be performed where the researcher looks at the similarities and differences featured among the case. In highlighting the research findings in this thesis, the researcher also uses a case-ordered descriptive matrix in order to provide descriptive
data from all the cases (Miles and Huberman, 1994). It should be explained, here, that the researcher will also use a case-ordered effect matrix to discuss the findings in each case and overall conclusion as suggested by Miles and Huberman (1994). What is more, as a result the conclusion of each theme will be made for every case discussion.

2.4.5 Tools in Analysing Qualitative Data

Qualitative content analysis could be done manually and with the existence of software computer tools. As suggested by Bazeley (2002), the use of computer software in analysing qualitative data can increase the rigour. In the last decade, many researchers have mainly used manual thematic analysis in order to analyse qualitative data. However, at present with the development of information technology (IT), the use of computer software can be seen as strategic tools to help the researcher to conduct analysis systematically. In this research, the researcher will use the NVivo 9 software in order to deal with the complexity of data as it functions as a strategic project management tool where all the interview data could be stored in one place, together with other sources such as documents, observation notes and photographs taken during observation. At the same time, an analysis notes folder can be added and this, of course, will make the analysis process more organised, systematic and comfortable to the researcher when undertaking analysis, thus enabling the coding process to be performed more systematically, with data from coding easily been derived through matrix coding tasks.

2.4.6 Verification, Validation and Triangulation

As an interpretive researcher, it should be highlighted, here, that there is a difference between determining the effect of the findings from qualitative research with the positivist research paradigm which mostly uses structural equation modelling (SEM). Even in evaluating the quality of the research, the criteria are different and a positivist paradigm uses validity, reliability and objectivity to value the quality of research. According to Bradley (1993) these three conventional criteria are not suitable for the interpretive paradigm that uses qualitative content analysis as the method of analysis as they are different in basic assumptions, research purpose and conclusion process. In order to ensure rigour and to validate and verify this current research, the researcher will deal with the issue of trustworthiness by following the rules developed by Lincoln and Guba (1985) and also followed by other qualitative researchers (Zhang and Wildemuth, 2006). It is significant to highlight that in evaluating interpretive research work, the researcher must make sure that they have these four criteria, namely, credibility, transferability, dependability and confirmability (Lincoln and Guba, 1985). Each of these four criteria has a different description and points to ensure the certainty of the research. According to Bradley (1993), credibility refers to “adequate representation of the constructions of the social world under study”. In other words, it actually ensures the accuracy of the
research. For example, in this research, triangulation, checking interpretation against fresh data, peer debriefing and member checking will also be performed. This process is recognised to enhance the credibility of the research (Lincoln and Guba, 1985).

3. CONCEPTUAL FRAMEWORK

As the case study method would be followed for this research, a conceptual framework has been developed and presented in the figure below. The developed conceptual model as a result of the discussions so far, will be validated during the empirical fieldwork. Figure shows that there are three main factors being explored in this research, namely internal, external and outcome factors, with regard to rebranding at BOP level, and each of these factors consists of several sub-factors. The main outcome expected is a significant positive effect of rebranding on company profitability. Figure also highlights “other factors” as the researcher believes other issues may come to light during the empirical work in consequence of the respondents wanting to share ideas during the interview sessions. This is because, as mentioned earlier, the research is based on BOP customer that might influence the relationship as claimed by previous researcher. Also, specifically, at the end of the interview, respondents will be asked whether there are any other matters they might want to share, and from this prompting, other factors may emerge.

Figure: Conceptual Framework
Source: Researchers own development

4. EXPECTED OUTCOMES

This research has been undertaken as a result of the inability of previous studies to provide a clearer understanding of the issue rebranding and its success at BOP level. As discussed earlier, the internal
and external factors have an import influence on the rebranding programme. However, it is expected that the factors that influence the companies to be rebranded could be different for developing countries specially the countries with BOP population. Therefore, this research will further explore the re-branding driver in order to enhance the current theory relating to the rebranding practices. Additionally, researcher expects that rebranding at BOP level will have a positive impact on company performance in the long run though the impact on short run could be negative. As the research will be carried out specifically for the Bangladesh telecom industry which is a developing country with BOP population and it is expected that the critical factors for success or failure would not be the similar in regards to developed country. Finally, other factors might emerge from the research which will help to explain the rebranding activities in BOP market.

Keywords: Bangladesh, bottom of pyramid (BOP), rebranding.

THE REFORM OF GOVERNMENTAL ACCOUNTING STANDARDS IN GREECE: DECISION-MAKING THROUGH THE “GARBAGE CAN”

Cohen, Sandra; Karatzimas, Sotirios

Department of Business Administration, Athens University of Economics and Business, Greece

ABSTRACT

The last decades the New Public Financial Management (NPFM) concept promotes the necessity of using financial management techniques for the development of an efficient and effective public sector. The changes of financial reporting systems emphasising on the application of accrual based accounting and even towards the adoption of international accounting standards (e.g. International Public Sector Accounting Standards) constitute typical forms of NPFM reforms (Guthrie et al., 1999; Lapsley et al., 2009). The reasons leading to such reforms could be traced in the need for improved accountability, transparency and decision-usefulness of the information provided by the public sector requested by the numerous different users (Kober et al., 2010). These users are members of the parliament and constituents of the state, but also other interested parties, such as lenders and other resource providers. Especially in periods of severe global recessions, states have to abide by recommendations deriving from external resource providers (Carpenter and Feroz, 2001). Therefore, resource dependency plays also a significant role in the accounting reforms in the public sector.

Within this context, the Greek central government recently proceeded in the reform of its governmental financial reporting system. The Greek state assigned this task to a commission of experts which brought together public sector executives and external consultants. The output of the commission was a set of new accounting standards under the modified-cash basis of accounting which superseded the until-then applied cash based standards. This move intended to improve the quality and usefulness of the provided accounting information, which had been questioned by both external organizations such as the International Monetary Fund (IMF), the European Commission (EC) and the Organization for Economic Cooperation and Development (OECD), as well as by internal users (voters and public managers) (Ministry of Finance, 2009). Furthermore, this reform was launched as an interim step before a future move to full accrual accounting (Cohen et al., 2014).

The scope of the present paper is to study the standard setting process in the central government level in a country that operates under special circumstances of financial strain. Greece has been deeply injured by a severe financial crisis that has been evident to the country since 2009, and resulted to the country’s entering in 2010 the financial support mechanism of the IMF, the European Central Bank (ECB) and the E.C., commonly referred to as Troika. The fund providers within the technical memoranda emphasize and demand the modernizing of Greek public sector, indicating several...
structural reforms that touch upon financial management and governmental accounting systems. Within this framework, we analyze the decision-making process during the development of the new set of accounting standards by unraveling the role of different actors. As the success of such reforms relays heavily on the role and incentives of the involved actors (Niskanen, 1971; Giroux, 1989) we apply the theoretical lens of public choice theory in an attempt to understand the incentives of bureaucrats, external consultants, voters, political leaders and resource providers that have played a role in the reform process. Decision-making in the public sector is characterized by limited economic rationality, which often drives public sector entities towards acting as “organized anarchies” (Cooper et al., 1981). The garbage can model provides insights that facilitate the understanding of the choices made while deciding on the set of governments accounting standards. Our theoretical framework is informed by the outcome of interviews and informal discussions with members of the commission that developed the new set of accounting standards, as well as by relevant archival data (e.g. IMF and OECD reports, Greek Ministry of Finance reports, etc.).

We consider that Greece is an interesting setting to study accounting standards decision making in the central government level, mainly for two reasons: First, because the country is under a vortex of financial and administrative reforms and this transition is very important if seen through the light of Greece’s resource dependency. Second, because the Greek public sector is characterized by a deeply cultivated bureaucracy (Sotirakou and Zeppou, 2005). This latter characteristic offers another interesting dimension to the research; how decisions are made –and who eventually makes them– in a country where strong bureaucracy prevails. The findings indicate the lack of effective monitoring of the process from both politicians and external resource providers. Eventually, the set of standards developed is largely the outcome of the incentives and the cooperation of bureaucrats and consultants. The results moreover, provide evidence of unclear technology, fluid participation and problematic preferences, which indicate decision-making through the “garbage can”.

USING CHOICE EXPERIMENTS TO EVALUATE CONSUMERS PREFERENCES ON ORGANIC WINES

Contò, Francesco; Fiore, Mariantonietta; Antonazzo, Anna Paola; Marchesino, Luca

ABSTRACT

OBJECTIVES

Although research on consumers preferences towards organic food appears copious and exhaustive, much is still to be accomplished about the perception of consumers with respect to organic wine. The new European regulation on organic wine clearly opens new opportunities of growth and competitiveness for producers. The establishment of the Reg. (EC) No 834/2007 complemented by Reg. (EU) No 203/2012 marking the transition from the “made from organic grapes” label to the “organic wine” label, enhanced the economic-ecological and social meaning of oenological products. Although the wine consumer retains a tendency to focus more on the price of the product and still appears distracted from the packaging and brand awareness (Forbes & Dean, 2013; Mueller & Szolnoki, 2010), new trends in preferences move towards innovative oenological products characterized by low content in sulphites and lower content in alcohol. Exposed to the pressure of demand changes, evolution of consumer preferences and competition of global markets, wine producers might see in consumer expectations for quality, sustainability and safety a significant opportunity to differentiate their products according to different markets segments particularly focusing on higher added value products (Chiodo et al., 2011). When selecting a product the consumer is often unable to give a scale of priorities and a monetary value to product’s attributes. Instead, the consumer chooses the product as a whole or by means of its complexity of tangible and intangible attributes. Wine belongs to a product category whose consumption can be considered of hedonistic type (Scarpi, 2005), since it stimulates ‘multi-sensory, fantasy and emotional aspects of consumer’s usage experience’ (Hirschman and Holbrook, 1982 p.92). Moreover, wine consumption assumed over years, an important cultural and social value among habitual consumers. The evocative meaning of wines recall the territory of origin and this function especially emerge among consumers inclined to travel in wine regions (Santos & Ribeiro, 2005). Interesting might be in our opinion, to address monetary value of organic attribute of wines within a target of consumers willing to consumption of quality wine and travel to live the evocative experience that wine can bring with itself. The work has the aim to address the value that
this particular segment of consumer gives to the "organic" component of wines compared to other attributes such as Protected Designation of Origin, region of origin and price. The study might imply interesting marketing suggestions for local wine companies selling their organic wines through the HORECA distribution channel, that mostly supplies foreign visitors.

**METHODOLOGY: CHOICE EXPERIMENTS DESIGN AND MODEL ESTIMATION**

The methodology consists of Choice Experiments (CE), which has its origins in Conjoint Analysis methods, used as well in marketing research and transport economics (Louviere and Hensher 1982, Louviere and Woodworth 1983). The CA methods have evolved and developed as Choice Experiments (CE) to address the economic value of public goods (Burton and Pearse, 2001; Burton et al., 2001; Travisi and Nijkamp, 2004). CE tools combine the theory of value (Lancaster, 1966) and the Random Utility Model (RUM) proposed by McFadden (1974) to assess consumer preferences. In the field of contingent valuation elicitation the choice models have received increasing attention in recent years showing significant advantages compared to other tools. The choice modelling is applicable in situations of discrete choice or when the decision-makers choose among a set of alternatives where the number of alternatives is a finite set and in case they are mutually exclusive. Moreover, the set of alternatives must be exhaustive: all possible alternatives are included and the respondents have to choose an alternative contained in the collection. The CM also differs from other methods because the Declare Preferences respondents are shown various alternative descriptions of the property that differ from the different levels made by the attributes through which they are described, and asked them to choose the alternative that most prefer. The CM, then, is based on the theory demand by Lancaster (1966), whereby each well can be described according to a set of characteristics (Hanley, 1998). The goods are different, so, for the different intensity or size that can take on different characteristics. Consequently, the utility that it arises from the consumption of these goods is seen as a weighted sum of the utilities attributable to each feature (attribute). The basic theoretical assumption is that individuals in their actual behavior as buyers, are able to choose between alternative options, each one characterized by a finite number of attributes articulated in different levels (Burton, 2001). With reference to purchase choices, according to the Random Utility Model (RUM), the consumer takes their own choices, identifying alternatives, providing the highest level of utility, i.e. the probability that a consumer chooses an alternative characteristic increase the utility associated with it. The experimental design section explores the construction of the design and the descriptive statistics of the sample. Under the suggestions of the prominent literature on the consumer preferences of wine and the choice experiments we proposed to the respondents the choices of three products characterized by
The methodology implied the creation of a hypothetical market of wines with multiple choice alternatives defined on different levels of the relevant attributes. For each set of products respondents were asked to select the most preferred one. We considered the following attributes level for the organic wine: (i) origin: for the purpose of the research we chose to added attributes that states the consumer preference towards wine produced in the Apulia region or produced in the rest of the national territory; (ii) the core attribute of characterizing the consumer choice is the organic label (presence/absence); (iii) Protected Designation of Origin (presence/absence); (iv) three level of prices: 3-7 €/bottle; 7-12 €/bottle; 12-20 €/bottle. The Choice Experiments were conducted in June and July of 2013 in South Italy. The data have been collected during the event “Calici di Stelle” (“Starry Glasses”), in Trani (Apulia, South Italy), which is a annual wine tasting event fostering the tourism of wine in regions whose wine companies invest particularly on high quality and sustainability of their products.

The survey was administered to be exhaustive and representative of the Italian population in terms of age and gender. Only respondents over 18 years old have been surveyed. The questionnaire on consumers’ preferences was composed of four parts. The first part contains questions about personal information and socioeconomic characteristics of the respondents. The second part investigates the attitudes of consumers toward the consumption of organic foods, as well as attitudes towards the environments. The latter allowed to elicit consumer’s preferences about organic food products, occasion of purchase and their awareness about organic food product benefits of consumption related to human health and the environment. The third part of the questionnaire focused on wine consumption behaviour and preferences. The fourth and last part contains the Choice Experiment sets sections. The questionnaires were submitted through face-to-face interviews to 300 respondents, but complete questionnaires were collected only in 258 cases.

EXPECTED RESULTS

Fulfilling the informative gap on the consumers perception of the organic components may foster competitiveness of local producers on competitive global markets. An important step in the interpretation of the results obtained with the estimation of the CM is the determination of path worth, such as the monetary value of the utility that the consumer assigns to a change in the level of one of the attributes typifying the product. Once analyzing the data we expect to obtain indicators on WTP for attributes of local wines with particular regards to organic component, we expect to obtain a quantitative of the monetary value of each component and a hierarchy of values associated with each attribute of the product in order to provide important indications to wine market operators.

A GENERALIZED LOTKA-VOLTERRA MODEL (GLVM) ADEQUACY OF A VOTING PROCESS

Costea, Carmen¹; Balta, Cornel²

¹Spiru Haret University
²Soc Univ. Alexandru Lapusneanu

ABSTRACT

The paper is developed as an application of a generalized Lotka-Volterra model (GLVM) used for the actual voting process analyze and forecasting. Initially started as a comparative basis between Argentinean and Romanian political systems, the research is now developed on Romanian comparative public data from polls and newspapers in order to build the new model parameters. The main goals of this paper are: a) to give an ansatz about the meaning of the three parameters’ model in an electoral process and correlated them with real data; b) to predict the result for the next Romanian presidential situation before the Fall presidential election.

ARGUMENT

People and scientists use to say that life is complex; however politics is even more. What looks good in a domain could be rocky path through the wilderness of so called opportunities in another one.

The human cognition process constitutes a process of exchange information among individual to check, correct or not some ‘personal observations’ in order to reach preliminary conclusions. The dynamic processes link citizens to various mental models including entities and large numbers of practical choices seen as opportunities. To pick it up correctly, one needs to understand the realities as they are not as they look to be.

Mental models include different ingredients and structures as ideology, religion, education level, expectations, and beliefs, internal and external norms, lining up a complex system to lashing interrelated degrees of freedom.

The complexity, as a relevant and elusive property of social systems has to be considered when analyse and adopt different behaviours in response to different situations [1, 2]. Mental models allow us to manage ourselves in ordinary life and being the basis of our own decision-making processes.

The high complexity of human individuals together with the relations among them requires new methods to describe the continuous change of social paradigms that characterizes the contemporary society. Each socio-political system, as a whole, performs day-to-day evaluations that help distinguishing between desirable and non-desirable evolutions of diverse social trends according to particular political, ethical, and ideological attitudes and norms in the model’s workings [3].
The fast irruption of the Information and Communications Technologies (ICT) into individuals’ life, like socioeconomic uncertainty, labour stress, the digital divide and its consequent inequality, as well as other problems such as regulatory frames, data protection, privacy, security, intellectual copyright [4], augments the complexity or social systems to a degree not seen before in the human history. The basic fact is that into the Information Society the interaction among individuals, companies, and governments occurs at great speed, not only between them but also among themselves. Therefore new tools are necessary for evaluating and prospecting this complex dynamics in any areas like social, psychological, economical, industrial, legal, ethical as systematic paths to understand that the impact of the ICT in Society is irreversible and unavoidable. Elections times are, as well, among those dynamic elements.

THE MODEL APPLICATION

The decision making in all stamens requires a careful risk management. The abundance of information, at times contradictory, at times wrong, which the individuals belonging to every subsystem receive, increases the difficulties in the process of transforming information into the knowledge necessary to make a decision-action, leaving always a doubt with respect to its quality, that is to say, as a result of the complex dynamics of the IS, the decision-actions taken will always have a margin of uncertainty.

In this contribution we applied a generalized Lotka-Volterra (L-V) model used some years ago to describe the competition between websites[5] and recently to find hung scenarios and contrarians’ dynamics in sociology [6]. Now we evaluate its potential to analyze and forecast modelled capabilities to the actual voting process.

The first problem is to define which data (polls) are represented by the model parameters, as well as if the ansatz shown below is or not correct. Our first attempt considered a comparative analyse between Romania and Argentina last presidential elections. At the time, we used public polls and newspapers for Romania to predict the Argentinean future results 1[9]. This new contribution will bring up to our attention the political horizons of the members of a given political system, in terms of the L-V model.

---

1 It deserves a special paragraph to explain why this two countries. There are several reasons to do so, among which we can enumerate the following: a) both democracies are relatively young (Argentina since 1983, Romania, 1989), b) Argentina is a presidential and Romania a semi presidential representative democratic republics. Meantime the President of Argentina is both head of state and head of government, Romania has President and Prime Minister charges; c) Both have Senate and Chamber of Deputies. In the Argentinean case the Senate President is the Nation Vice President and they are elected as a whole. Instead in Romania President and Prime Minister may come from different parties. Once elected the President remains independent. d) Both electoral systems have ballotage, and e) probably the most important MAS approach to political prospection and alliance analysis 3 there are more than two or three structured parties which gives rise to a game of alliances.
In this sense the different candidates are “agents” of the system, whose chances are measured by polls. No political considerations are taken into account, neither the simulations presented reflects political opinions of the authors. Only public information has been used to check the qualities of the model and make a new prediction for the future fall elections.

We have started with the 2009 case and the CCSB data regarding the elections which took place on November 26, 2009 and ended on December 6. Now, we know both the final results and the final alliances achieved. Now we can “prospect” chances of different other alliances and compare them with the result. We prospect the horizon of each agent of the Romanian political system, assuming the following considerations: a) positive percentage represents the positive image, and it is represented by the $\beta$ parameter; b) the remaining percentage is the negative image and is used to determine the initial conditions of each agent, taken them as the inverse of the negative image.

The 2009 initial numerical simulation considered the candidates using data from another CCBS poll (July, 2009), where the public opinion efforts focused on investigation of potential alliances between two parties (PDL and PNL+PSD) and the independent candidate.

**Table I**

<table>

<td>PSD</td>
</tr>
</tbody>
</table>

Data from Table I is plotted in Figure 1:

![Figure 1](image_url)

Simulations, as well as initial conditions have been normalized for the sake of simplicity. So: $f_i(0)$ are: 0.132, 0.170, 0.1760 and $\beta$’s are: 0.483, 0.372, 0.349, 0.341, 0.318, 0.270. The $\gamma_{ij}$’s are +1 for all the simulations (competitive scenario), unless some alliance is explicated. The $\alpha$’s are equal to +1, in all simulations.

**Table II**
Case B
Victor Ponta 0.46 PSD
Klaus Iohannis 0.25 PNL+PDL
Sorin Oprescu 0.16 Independent

The numerical simulation (data from Table II) is plotted in Figure 2.

The research proves that the ansatz on model parameters validated the 2009 Romanian results got by using the Romanian polls, and secondly validated them, based on the Argentinean election results. The model used this way may prove the need for other versions of alliances for the new Romanian elections based on the vote intentions and the positive images of potential candidates in less than 100 days before the new elections.

ORGANIZATIONAL ANTECEDENTS OF MANAGERIAL ORIENTATIONS

Dahan, Gavriel 1; Shoham, Aviv 2

1Department of Economics, Western Galilee College, Israel
2Department of Business Administration, University of Haifa, Israel

ABSTRACT

Strategic orientations have attracted scholars' attention across disciplines. The pros and cons of such orientations have been studied extensively. However, studies have focused mainly on outcomes of such orientations but less so on their antecedents. Against this background, we developed and tested a model of organizational antecedents of pioneering and entrepreneurial orientations.

THE MODEL

ANTECEDENTS

As presented in the model above, this research focuses on internal orientations and organizational antecedents since managers control such factors. Based on Jaworski and Kohli (1993), antecedents include three multi-faceted sets of factors: management, departments, and the organization.
INTERNAL ORIENTATIONS

Prior studies have argued that firms should develop and use multiple orientations (Hakala, 2011) since no single orientation leads to superior performance in all situations (Noble, Sinha and Kumar, 2002). Our research focused on pioneering and entrepreneurial orientations. Although the conceptualizations of these orientations overlap to an extent (e.g., risk taking and innovation), we used distinct operationalization taken from the literature thus minimizing operational overlaps. We claim that pioneering and entrepreneurial orientations represent different world-views and lenses through which firms view and act on the environment.

RESULTS

Our model aimed to find relationships between an antecedents and internal orientations such pioneering and entrepreneurial orientations.

We conducted two regression models. Each of models examined separately what antecedent impact pioneering and entrepreneurial orientations.

The main findings show that Risk Taking was found significant (p<0.05) and effect on both orientations. Additionally, we suggest that adopting a risk taking could improve the success of opportunities and responding to competitive threats in the marketplace which eventually increase firm performance.

MANAGERS’ VOICES IN CONFLICT SITUATIONS – OPENING DOORS, WAITING FOR THEM TO OPEN OR STAYING BEHIND CLOSED DOORS: GENDER PERSPECTIVE

Desivilya Syna, Helena1; Yagil, Dana2

1Department of Sociology and Anthropology, The Max Stern Yezreel Valley College, Israel
2Department of Human Services, University of Haifa, Israel

ABSTRACT

RESEARCH AIMS

The current study aimed to illuminate the construal of voice by upper echelon managers: perception of voice as in-role versus extra-role behaviors and discerning its functions in exercising power and exerting influence in organizations. In addition it was designed to elucidate the strategies managers use to meaningfully express their voices, to unravel the mechanisms whereby their voices are suppressed and explore their reactions to such silencing attempts. This paper focuses on the meaning of voice and its manifestations in organizational conflict situations, while embracing gender perspective. The current research endeavor constitutes a new departure in voice research by looking at the construal of both voice and silencing as well as focusing on upper echelon managers, previously hardly studied in this domain.

THEORETICAL BACKGROUND

Effective strategic management at the upper echelons constitutes a vital component of organizational sustainability in the current complex socio-political, economic and cultural environment. The capacity to openly express critical opinions concerning organizational policy and present propositions for changes deems essential in promoting such goals (LePine & Van Dyne, 2001). The latter vital capability constitutes a challenge for managers as it requires them to engage conflicts rooted in both structural and process aspects of organizations.

The complex contemporary reality makes organizations vibrant sites of conflicts within and between stakeholder groups (Bidwell et. al, 2013; Desivilya Syna, 2011; Kolb and Putnam, 1992; Putnam, 2010). Each party attempts to shape organizational practices, using intra-organizational negotiation with the other parties and mobilizing internal as well as external support. Disputes and discords stem from divergent expectations and perceptions of different actors and their tendencies to control organizational processes and outcomes. Consequently, power concerns are salient in organizational
settings, sometimes in an explicit form, but more often in a symbolic fashion (Desivilya Syna & Rottman, 2012; Fuller, 2011; Putnam, 2010).

Thus, the main query explored in this paper revolves around manifestations of the need for control of upper echelon managers in conflict situations; namely, how do women and men at the top of organizations maneuver in the course of actual conflict in order to meaningfully express their voice, thereby asserting their organizational positions but at the same time minimizing personal costs.

Voice has been construed as behavior that challenges the status quo with the intent of improving a situation rather than merely criticizing it (LePine & Van Dyne, 1998). It includes such behaviors as speaking up about organizational issues and suggesting changes to strategies, structures and processes (Van Dyne et al., 1995; Van Dyne & LePine, 1998). The prevailing trend in the literature has been to construct voice as employee’s extra-role behavior; namely, actions not required by formal job definitions. Presumably, the construal of voice in manager’s position is quite distinct; constitutes an inherent component of her or his job that is in-role behavior. We have examined the latter assumption in the current study.

Due to the complex socio-political and economic reality, which affects today’s organizations, upper echelon managers are not always capable of voicing their concerns, expressing critical opinions and suggesting radical policy changes. Thus, investigation of voice suppression mechanisms and strategies used by senior managers to engage such silencing attempts, especially in conflict situations appears vital. Some evidence in this regard comes from research on gender in organizations, suggesting that women are often accorded visibility on the superficial level, albeit implicitly silenced (Simpson & Lewis, 2005). In a similar vein, Clair et al. (2012) showed that demographically atypical professionals are often subtly silenced and marginalized. Suppression and silencing of voices, especially at the upper echelons of organizations can have detrimental effects on the quality of strategic decisions and thereby on organizational members and the public in the society at large. Yet, extant research has hardly examined the ways whereby senior managers’ expressions of genuine concerns are halted and how do they react to such attempts. The current study attempted to shed some light on the suppression mechanisms and upper echelon managers’ strategies to deal with silencing attempts. This study also endeavored to discern the role of gender in construal of voice and silencing, voicing strategies and reactions to silencing while facing organizational conflicts. Previous research on women’s voices in management and specifically in conflict situations show that female managers in comparison to male managers often attend organizational discords and engage organizational power issues rather differently (Desivilya Syna and Palgi, in press; Kolb and McGinn, 2011).

In sum, the central questions examined in the current study were:
• How do upper echelon managers – women and men - construe voice in conflict situations? Do they view it as intra-role versus extra-role behaviors?
• What kind of strategies female and male managers at upper echelons of organizations employ to voice their concerns in conflict situations?
• How do upper echelon managers perceive the attempts to suppress their voices in conflict situations?

METHODOLOGY
The study attempted to encourage the study participants to reflect upon their management practice: discern the meaning and role of voice in their management practice, elucidate their strategies of voicing and reactions to silencing. To accomplish this goal a qualitative methodology was employed.

Study Participants. Twenty nine managers (13 women and 16 men) at upper echelon positions in private (e.g., a head of operation division in industry), public (e.g., head physician of a medical department in major public hospital, head of academic administration in an academic institution) and third sector organizations (e.g., a manager of NGO) were recruited to participate in the study. A snow-ball technique was used to invite senior managers to take part in this research, starting with acquaintances and asking them to suggest other prospective participants. To protect the participants’ rights and comply with research ethics principles, all the identifying information of the participants was transformed into codes and all the data is kept solely in the research team’s records. Upon the completion of data analyses the participants will receive the summary of findings.

The Research Tool. The research tool was in depth individual interview conducted face-to-face with each participant. It was designed to elucidate each participant’s construal of their respective experiences of voicing (focusing on their choice of strategies), suppression of their voices and their reactions to such attempts. The current paper focuses on a subset of three questions focusing on managers’ voice in conflict situations:

• Situations of disagreement: “Situations of disagreement are quite frequent at upper echelons of organizations, could you please describe your experiences in this area.
• Please describe a recent case of a disagreement with somebody at work (your peers or superior). Who was the other person? What have you done? What has the other person done? What were the outcomes?”
• Expressed criticism: “Please give me an example of a situation when you expressed criticism with regard to something that happens in your organizations (not criticism of your subordinates). To whom have you expressed it? How? What were the reactions?”
• **Criticism not expressed:** “Please describe a case where you have been critical with regarding to something in your organization but you have not expressed your criticism. Why?”

**INITIAL FINDINGS AND CONCLUSIONS**

Data analysis entailed content analysis, which was executed in accordance with the principles of qualitative research: ensuring that at least two of the researchers analyzed each interview to accord further validity to the interpretation. The data were analyzed in three main stages: in the first, “open coding”, we read each group interview from beginning to end to gain an initial impression of the main emerging themes. Then we conducted a mapping analysis, in which we laterally assembled the data. Finally, we reverted back to each interviews for a focused analysis, aiming to identify the interviewees’ construal with regard to the concepts and notions arising from the professional literature (Lincoln & Guba, 1985; Shkedi, 2003; Strauss and Corbin, 1998).

**Initial Findings**

**The meaning of voice in conflict situations**

The findings strongly suggest that senior managers – both women and men – construe voice and exerting influence as *in-role behavior*; namely, an integral component of their job definition. Thus, their role expectations entail challenging the status quo and express their genuine views concerning organizational issues. This finding lends support to our assumption that the definition of voice in manager’s position is distinct in comparison to employees for whom voice constitutes an extra-role behavior. The in-role perception of voice becomes even more salient in conflict situations with peers or superiors as they sharpen the divergence between the manager and the opponent and precipitate the need to engage the conflict while asserting one’s own position. The conflicts indicated by the study participants have revolved around “stolen” credit for ideas, discordant views with regard to work procedures, organizational policies, human resources in general or specific employees. Most of the conflict issues reveal overt or hidden power struggles between the manager and his or her adversary.

**Gender and construal of voice.** Lack of voicing tends to be rationalized, by and large attributed to external sources, such as the superior’s autocratic management style, organizational culture, and unbearable potential cost for the organization and employees. Men seem to exhibit stronger tendency for rationalizing paucity of voice and assign blame to external factors in comparison to women. For male mangers refraining from genuine and open expression of their concerns in conflict situations is antithetical to normatively prescribed behavior. By contrast, female managers appear to be more aware than men of their difficulties in expressing genuine voices, hence more likely to ascribe lack of voicing to internal factors.
Patterns of voicing: gender perspective

In line with Fuller's contention (2011), both women and men at upper echelons of organizations find it quite difficult to exhibit a nonconformist stance and behavior. Yet, our findings suggest that gender plays a significant role in voicing patterns. Male managers tend to "open doors" that is voice their concerns rather forcefully, directly and act swiftly, although following strategic calculations (long term goals, potential personal costs versus gains). Female managers appear to be more reserved, often waiting for "doors to open"; namely, act behind the scene building coalitions, collecting data and evidence to support their claims.

The findings also show that voicing attempts reflect dynamic patterns which may be inaugurated by active and direct moves, tactically paused and resumed embracing a more cooperative orientation later on. Depending on the nature of the conflict, especially its importance, women and men alike seem to be quite persistent in expressing their concerns in conflict situations.

Perceptions of silencing and managers' reactions

Both men and women report experiences of silencing attempts by their opponents in conflict situations. These acts are perceived as attempts to undermine their power positions and impede their influence in organizations. The managers' reaction appears to be contingent on organizational culture, perceived price of responding with high resolve, availability of support and importance of the conflict issues. Gender seems to matter in this domain: while women attempt to restore their position using mainly cooperative turns, otherwise remain "behind closed doors" or exit the relationships or the organization altogether), men tend use "counter moves" or "restorative turns" (Kolb, 2004).

Initial Conclusions

Initial findings point to construal of voice as in-role behavior by both female as well as male managers, designed to exert influence and sustain organizational senior position. Consequently, lack of voicing tends to be rationalized. Voicing patterns are dynamic in nature, reflecting persistence in managers' attempts to express their genuine concerns, while modifying tactics along the way.

Silencing attempts in conflict situations are interpreted as moves: the adversaries' intention to undercut one's position. The reactions revolve around restoration of managers' influence and position.

Power and influence figure prominently in conflict experiences of upper echelon managers. Gender appears to play a significant role in the construal of voice, patterns of voicing and in reactions to silencing in conflict situations.

Keywords: organizational conflict, voice, upper echelon managers, gender, power relations, in-role behavior.

FIRM GROWTH AND LIQUIDITY CONSTRAINTS IN MANUFACTURING AND SERVICE SECTORS: A COMPARATIVE ANALYSIS AT INDIVIDUAL INDUSTRIAL LEVEL

Donati, Cristiana
Second University of Naples, Capua, Italy

ABSTRACT

We use a large firm-level panel data set to analyze the relevance of liquidity constraints on firm growth in Italy. In most European countries mainstream financial institutions are scantly able to provide affordable credit facilities to small firms. Thus, these firms are forced to finance their growth almost exclusively through retained earnings. We estimate a dynamic version of Gibrat-law, incorporating cash flow as a measure of financial constraints, for different size classes of SME and for several industries in manufacturing and service sectors. The findings show that, in general, small manufacturing firms have higher growth-cash flow sensitivities with respect to medium firms without relevant differences between the four Pavitt technological sectors considered. Conversely, our results highlight, for the services, a significant heterogeneity in the impact of liquidity constraints on firm growth. In particular, for small firms that belong to Knowledge Intensive Market Services liquidity constraints appear relatively more severe in comparison with what occurs in the traditional service industries. Validation of Gibrat-law in the services suggest that an important group of industries, with a superior capacity of encouraging firm’s competitiveness, need more financial resources to promote their growth and that of the manufacturing sectors with whom they are connected.

In the last decades the debate on the validity of the so called Gibrat’s Law, or Law of Proportional Effect (LPE) and the empirical analysis conducted to ascertain if firm growth rates are uncorrelated with the initial firm size, has led to an increase in the number of studies concerning manufacturing firms, while few studies have focused on investigating if LPE holds for the service industry. Some contributes pointed out (Audretsch et al. 1999 and 2004, Teruel-Carizosa 2010) that the pattern of firm growth in the manufacturing and service industries is different for the presence in the first sector of higher sunk costs. Some empirical analysis (centered on few individual service industries) found that LPE holds for service sectors, but some recent works found evidence of the opposite outcome (Oliveira and Fortunato 2008 and Teruel-Carizosa 2010). Analyzing growth’s dynamic in the service sector is crucial, since this industry, in the last decades, has increased its contribution to the GDP, to the process of job creation and more in general to the economic performance of a country. Moreover the use of new technologies is directly or indirectly incorporated in the activities of many service industries; this means that not only many service firms provide information in different forms but also...
that the use of information and communication technology (ICT), from firms belonging to this industry, allows the standardization of many service activities making them more similar to mass-production goods. In our work, we consider different kinds of services firms, that differ in the degree of technological intensity, analyzing in particular those firms belonging to knowledge intensive market services, that are significant users of high technology (in terms of ICT capital) and relatively highly skilled workforce, because the role of this kind of services appears crucial to promote the competitiveness of an economy. Indeed firms operating in this sector are particularly able to meet the demands of modern highly competitive business environment. Moreover, these kind of sectors represent the natural by-product of modern knowledge economies within which increasing specialization induces the need for professional agents in the markets for external knowledge (Consoli and Eiche-Hortelano 2010).

To explain the possible deviation from Gibrat’s law and following a recent stream of literature (see Oliveira and Fortunato 2006 and 2008) we make use of financing constraint literature. In particular this work is centered on a large sample of Italian small and medium size (SME) firms since this category represents almost the total of Italian firms.

In the last decade, in Italy, the wave of mergers and acquisitions, have reduced the number of banks and created large national and multinational bank holding companies. Thus the increasing functional distance, that separates the decision center of a bank from its operational branches, changed lending behavior and relationship between banks and firms. Moreover, considering that for SME firms the wedge between the cost of internal and external finance may be huge, we want to ascertain how the presence of liquidity constraints impacts on firm growth, verifying if some important differences exist between SME of different size classes and between individual industries of both manufacturing and service sector. To this aim and to draw some policy implications we split our sample considering not only different size classes of SME firms but also some individual industries inside manufacturing and service sector with a different degree of technological adoption.

To our knowledge this work represent the first attempt to study liquidity constraints on firm growth analyzing the differences that prevail inside manufacturing and service sectors depending on technological classification of each industry examined. In particular, in the services, we compare the results obtained looking at the skill composition of the workforce and at the indicators of innovation intensity that characterized some sectors. Moreover the development of firms that produce ICT or knowledge intensive market services, like Scientific R&D Advertising and Market research, Other Professional, Scientific and Technical Activities, appears crucial to sustain the growth of manufacturing firms that need using this kind of services to maintain or improve their competitiveness on international markets. Therefore we focused our attention on a group of services
that are significant users of high technologies and use relatively highly skilled workforce, since the progressive use of technology in production, the international sourcing of manufacturing goods and other social factors, have increased, over the last decade, the relevance of this kind of services to guarantee the competitiveness and the innovative capacity of a country.

Using a very large dataset our findings show that LPE does not hold for all SME firms regardless the fact that they belong to a manufacturing or services industries. Considering the manufacturing industries in particular we can conclude that all small firms (firms with less than 51 employees) tend to be liquidity constrained. Comparing the results obtained for the size class, conventionally defined, of very small firms (less than 20 employees) with those obtained for the more comprehensive size class of small firms, we notice that in four sectors the sensitivity of growth to cash-flows appear higher in very small firms than it is in small firms. These four industries are characterized by a medium-high or high level of technology adoption. However, on restricting the analysis to the subsamples of very small firms, we notice that industries whose growth appears more financially constrained are widely spread in all individual industries examined regardless the level of technology adoption. In most cases, instead, medium firms (51-250 employees) of both manufacturing and services industries do not seem to suffer from liquidity constraints. These findings are consistent with the hypothesis of asymmetric information according to which in the credit market small firms represent for the bank more opaque borrowers and, for this reason, are more likely subjected to credit rationing.

Contrary to the findings of Oliveira and Fortunato (2008), suggesting that financial structure does not impact on firm growth, our results reveal that, as regards the service industry, only high technological sectors seem not to suffer from the presence of liquidity constraints. The sensitivity of the growth rates to the cash-flow appears, relatively high not particularly for the traditional services, but, above all, for small firms belonging to ICT-services (Computer programming, Consultancy and Related activities) and, more in general, for small firms of Knowledge Intensive Market Services. In the manufacturing liquidity constraints hinder the growth of small firms with different level of technology adoption, instead, in the service sectors small firms with high skilled workforce and with high R&D intensity appear more liquidity constrained than firms belonging to the traditional services. This result show that, an important group of services industries, with a superior capacity of encouraging firm competitiveness, need more financial resources to promote their growth and that of the manufacturing sectors with whom they are connected.

MOTIVES, EXPECTATIONS AND ECONOMIC RESULTS OF MERGERS AND ACQUISITIONS IN THE KIBBUTZ INDUSTRY

Edom, Sara¹; Edur, Ram²; Kroll, Yoram³

¹Ashkelon College, Israel
²Ben Gurion University, Israel
³Ono Academic College (OAC), Israel

ABSTRACT
This study examines motives, expectations and economic results of the 21st century revolution in which public and private investors purchased equity in kibbutz industrial companies. The results show that in the period 2000–2011, assets, sales and equity indeed grew more in the kibbutz industrial companies that joined with external partners, than companies that remained fully owned by a kibbutz. However, in terms of efficiency, profitability and deleveraging, the results of the M&A processes were disappointing.

INTRODUCTION
In this study, we investigated the motives and expectations of mergers and acquisitions (M&A) and examine the economic results of private acquired firms, kibbutz¹ owned industrial firms in the period 2000 – 2011.

The purpose of this study is double:
1. To learn the motives and expectations of the three parties involved in the M&A, the owner - the kibbutz, the board of directors of the industrial company and the investor – the external partner.
2. To examine the impact of M&A on the financial performance of the acquired firm in the post M&A period.

M&A is one of the principal ways to implement growth strategy (Feito-Ruiz and Menendez-Requejo 2010). M&A activity grows constantly. Grant Thornton's 2013 survey found growth of 56% in cross-border M&A in the world during 2008 – 2013, and 28% of the companies planned to grow in the coming year through M&A (Hughes, 2013). The trend of M&A is driven by global competition, macroeconomic constraints, economics of scale, entrance into new markets, opportunities, adoption of modern technologies, synergy, diversification, risk diversification, survival of firms in distress (Feito-

¹In Israel there are 275 kibbutzes; in 2011 the kibbutz population was 1.8% of the population of Israel. A kibbutz is a kind of commune. The first kibbutz was established in 1910; most of the kibbutzes have existed for over 50 years, and they are multi-generational communities.
Ruiz and Menendez-Requejo (2010), market timing, agency motives and hubris, response to industry and economic shocks (Hien, Kenneth and Qian, 2012). Most empirical studies have investigated M&A of publicly traded companies. Only a few studies have investigated the economic performance of private firms undergoing M&A (Feito-Ruiz and Menendez-Requejo 2010; Richards T. and Manfedo M. 2003). The few studies that investigated M&A of private firms analyzed a case (Steen A. and Welch L. S. 2006) or were based on financial reports received from State authorities (Ravenscraft D. and Scherer M. F. 1989) or from the National Bank (Shim J. and Okamuro H. 2011).

In parts of Europe, Asia and Latin America, many more businesses are private and family-owned rather than publicly owned; family firms play a significant role in the domestic and global economy (Drik 1990). Private firms, family firms and cooperatives act in similar environmental conditions as other firms, and use the same strategy of M&A for survival and growth (Richards T. and Manfedo M., 2000; Feito-Ruiz and Menendez-Requejo, 2010). Despite the important role of private firms in the economy and the fact that private firms also use the M&A strategy, most studies investigated public companies. The main reason for understudying of the impact of M&A on financial performance of private firms is the lack of data on private firms after M&A, which often no longer exist as distinct companies, or become entities of the acquiring firm (Tuch and O’sullivan, 2007).

The uniqueness of this research is the investigation of the economic performance of private industrial firms both pre- and post- M&A. The analysis of the economic performances are based on annual accounting reports. The existence of a unique database of multi-years of annual accounting reports of all the kibbutzes and their industrial companies in the kibbutz movement has made possible the current study. This study included only kibbutz industrial companies; private firms have not been included in the research group or the control group, since private firms do not allow publication of their economic performance data.

The kibbutz industry sector is about 10% from the Israeli industrial sector (sales and employees). In the mid-1990s, there were 393 industrial companies in the kibbutzes, most of which were owned by the kibbutz only; at the end of 2005 only 72% of the industrial companies was owned by the kibbutz only, and at the end of 2011, it decreased to 48%.

Over time, the kibbutz industrial companies have integrated into the global economy and thus have become increasingly similar to other industrial companies.

1 Sours: the Annual Review - Kibbutz Industries Association (KIA) 2011.
METHODS
Empirical studies that investigated the impact of M&A on economic performance of firms did so using two methods (Tariq H. I., Abdulati A. A. and Radwa M. A. 2011):

1. **Evaluation of the excess return of the shares** of the acquirer and the acquired because of the declaration of the M&A. The studies that used this method usually found excess return to the acquired firm and underperformance to the acquirer (Andrade G., Mitchell M. and Stafford E. 2001; Dickerson A. P., Gibson H.D. and Tsakalotos E. 1997; D. Ravenscraft, and M. F. Scherer 1987; Shinha N., Kaushik K. P. and Chaudhary T. 2010)

2. **Accounting reports-analysis**: The disadvantages of this method are the availability and accessibility of data of this kind. Studies that have used this method found no significant improvement in the performance of the firm after the M&A (Tuch C., and O’sullivan N. 2007).

In the current study, we use annual financial accounting reports; performance was assessed using two methods:

A. A comparison of the change in economic performance between the research group of firms with external partners to that of the control group, which consisted of firms without partners, in the timeframe of two years prior to and two years following the year of joining with the external partner.

B. Comparison of economic performance indices over a period, between the group of firms with partners and the group of firms without partners. The comparison has been made for two periods: 1. 2001-2009 included 11 firms with partners throughout the whole period. 2. 2005-2009 included 24 firms with partners throughout the whole period.

The motives and expectations were investigated by the analysis of 75 cases out of the 100 M&A in the first decade of the 2000s. In each case the managers of the kibbutz or/and the industrial company who lead the M&A process were interviewed. The data was collected by using a quantitative questionnaire.

MAIN FINDINGS

**Motives and expectations**: each of the three parties involved in the merger-acquisition has different goals; the goals of the kibbutz and the owner of the company, were different from those of the governing board of the company. The goal of the board was more similar to those of the investor-partner than to those of the kibbutz - the owner. The most important goals of the kibbutz in diluted holdings were risk diversification and raising of capital to finance the business growth and ensure business continuity. The most important goals of the board of directors was to increase sales and
profitability, and finance the growth of the business. The most important goals of the investor-partner were to increase revenue and profit. The shared goals of the three parties involved in the M&A transaction was business growth and increase of profitability. The economic findings suggest that sales and assets have grown in industrial companies with partners more than in industrial companies without partners, whereas the efficiency indices increase more in the companies without partners than in those with partners. These findings support the kibbutz leader's assessment that the goal of growth of business has been achieved and the goal of increased profitability and management improvement has been achieved only partly.

PUTTING CARROLL’S MODEL INTO TEST: THE CASE OF LEBANON AND TUNISIA

El Dirani, Ali1; Yahiaoui, Dorra2; Golli, Adel1

1American University Of Science And Technology
2Kedge Business School

ABSTRACT

The literature on Corporate Social Responsibility (CSR) is rich with pioneering conceptualizations that attempt to capture CSR’s meanings, drivers, domains, effects and environment criteria. However, one of the most highly cited work and progressive CSR thinking during 1970s remains Carroll’s landmark work. Carroll (1979) presented an interesting taxonomy which reconciles CSR types in a four-facet model that includes the economic, legal, ethical and discretionary domains of social responsibility. The domain of economic responsibility is the foundation for all other domains with the legal responsibility being an affirmative action and the ethical responsibility being a reaction action and finally the discretionary responsibility being a proactive action which placed on the apex. Carroll’s four domains are aggregative and businesses are expected to fulfil them simultaneously. In this sense, their business decisions are expected to have economic, legal, ethical and discretionary basis to achieve a balanced orientation towards different stakeholders. This is the essence of Carroll’s model, which was revealed during a critical period of time when the CSR field of literature was still in its infant and early inception stage in the 1970s. It could be argued too that this model was among the first, if not the first; models which was tested and qualified within a set of collected data. Carroll’s model was timely and one of the earliest theoretical propositions within the literature.

Early CSR academics as well as practitioners needed this model to gain legitimacy and credibility for their CSR case and argument. For instance, drawing on Carroll’s model many scholars came after and made their contributions. Wood (1991) in her model on social performance (CSP) extended Carroll’s model and emphasized the importance of social responsiveness process. The stakeholder theory perspective brought by Freeman (1984) completed the picture by stressing the importance of maintaining a balanced relationship with different stakeholders and responding to their needs. Carroll himself provided in 1991 a stakeholder/responsibility matrix which links economic, legal, ethical and philanthropic responsibilities to stakeholder groups, e.g. employees, customers, community. Again, Wood and Jones (1995) suggested using a stakeholder framework to assess outcomes of CSP whether they meet stakeholders’ needs or not. We can see...
here how Carroll’s model became a focal point and important reference for many later important conceptualizations with the CSR literature.

This model was set and mainly used in the particular context of Western countries (Garriga and Melé (2004), Waddock et al. (2002)). However, little research focused on using this model in less developed countries (Jamali and Mirshak (2007), Golli and Yahiaoui (2009), Ibrahim et al. (2012), Jamali and El Dirani (2013)) and check its applicability and ability to explain CSR dynamics. Rather than taking the model as for granted and irrespective of the context where it’s being studied, our papers attempts to explore the validity of Carroll’s model in the particular context of Lebanon and Tunisia. Findings from both countries could generate enriching and insightful knowledge about CSR in the absence of in-depth and institutional research efforts in both countries as compared to theoretical and managerial CSR advancement in other contexts as for example in UK, Australia and the USA.

For this purpose, we made a qualitative study within 18 case studies that were selected based on their level of CSR activity. An in-depth interview was conducted with managers responsible for CSR (15 in Lebanon and 17 in Tunisia). The interviews lasted between one and two hours. Our interview questions were designed to cover CSR understanding, CSR domains and activities and whether or not Carroll’s taxonomy is practical and sufficient in meeting and fitting CSR knowledge and practices in Lebanon and Tunisia. Although we prepared an interview guide prior to interviews, however semi-structured interviews helped us to be more flexible in the sequence of questions in light of the progress of the interviews. Secondary data were also collected from CSR reports and web materials. The interviews were transcribed and with the documents mentioned they were analyzed using coding method whereby codes were initiated and grouped as they were identified from the data and the conceptual categories. For internal validity, within case-analysis and cross-case analysis were conducted by identifying the similarities between the cases (Yin, 2009).

Our investigation made it possible for us to recommend some developments to be introduced to Carroll’s model to make it more flexible and holistic or benefiting from some models presented within the literature on strategic CSR among different factors to take into account in international context. We recommend in this perspective Porter and Kramer’s 2006 and Waddock and Graves’s 1997 models that appear to be more flexible and practical to follow CSR as it develops from a pure philanthropic and unsystematic approach to a more strategic CSR approach in Lebanon and Tunisia, away from CSR taxonomies.

ABSTRACT
Wine has emerged in latest decades as one of the most interesting market throughout the world, both for Old World countries (Italy, France, Spain, and others based in Europe) and for New World countries (US, Chile, Argentina, South Africa, Australia and New Zealand, only to mention the most important ones). It is a common opinion that Old World countries are still focused on wine production, while New World countries are more focused on wine marketing (Resnick, 2008).

The 4Ps (product, price, promotion, and place) are the traditional framework by which marketing academicians, managers and professional implement the operating stage of the marketing management process (McCarthy, 1960). This framework is very powerful because it can be used in every sector or market, in which, however, the 4 Ps need to be contextualized (see for example the 4cs of Lauterborn, 1990, now mostly used in service marketing).

Starting from the model of the 4Ps, in this article the authors will develop a theoretical framework for a contextualized version of wine marketing mix, that can be based on the 4Es (expertise, evaluation, education, and experience) as a ‘global’ marketing technique. In the case of wine, in fact, the utility of the product needs to be explained and understood (product – expertise), and appreciated not only in terms of money, but in a more general judgment (price – evaluation); furthermore, the perception of the product shall be combined to the occasion of present/future consumption (communication – education), that enriches the overall situation of purchase (distribution – experience).

The study is oriented to develop a theoretical framework about wine marketing mix that constitutes an original concept of the authors, able to be applied and recognized in every wine market, domestic or international. Bases of the research are a huge literature review about marketing mix in general and wine marketing in particular, together with an adequate set of in-depth interviews with wine entrepreneurs, managers, sommeliers, operators, and wine lovers, so to justify the exploratory nature of this research (furthers studies are forthcoming to verify the statistical validity of the model).
CROSS-BORDER FUNDING AND MICROFINANCE MISSION DRIFT:
EVIDENCE FROM SUB SAHARAN AFRICA

Forkusam, Akem Noela
School of Economics and Law, University of Oldenburg, Oldenburg, Germany

ABSTRACT

INTRODUCTION

CGAP Cross-border funder survey (2012) shows that despite the financial crisis, cross-border commitments to microfinance institutions (MFIs) in Sub Saharan Africa (SSA) increased by 12 percent per year on average between 2009 and 2011 to reach close US $ 2.7 billion. This funding could be seen as an additional source of capital for MFIs (Swanson, 2008). However, these funds are provided by public and private investors with each having different motives. Most public funders use microfinance as a tool to achieve development goals such as poverty reduction and financial inclusion (El-Zoghbi et al., 2011, p.1). On the contrary, for some private investors, microfinance is a new emerging asset where high profit could be maximized (Dieckmann 2007). For other private investors microfinance presents an opportunity to diversify their investment portfolios, while also achieving social and environment objectives-socially responsible investors (El-Zoghbi et al., 2011, p.1). This article provides an evaluation of whether these different foreign sources of capital affect the dual mission of MFIs. Recent studies Martins and Winkler, 2013; Mersland and Urgeghe, 2013; Mersland et al., 2011 have identified different dimensions of foreign involvement on microfinance mission drift. However, the literature has been silent on cross-border commitments, which is consists of public and private funding. Furthermore, the study uses data from SSA which is the poorest region (World Bank, World Development Indicators 2013) and the region with lowest banked households CGAP and World Bank, 2010, p.4).

THEORY AND HYPOTHESIS

The research builds its arguments on two theories; capital structure and agency costs. Firstly, the capital structure theory assumes that in a perfect capital market, homogenous expectations, absence of taxes, and no transaction costs, the value of a firm is unaffected by the way it is financed (Modigliani and Miller 1958). However, empirical researches (Boateng, 2004; Miller and Modigliani, 1966) show that in the real world, capital structure decisions do affect firm value and performance. In the same
vein, it could be argued the capital structure (debt, equity, grants and guarantee) employed by an MFI could either promote or prevent the MFI from drifting from its mission.

Secondly, the agency cost theory presumes that the separation of ownership (shareholders) and management (agents) can affect capital structure choice and firm value (Jensen and Meckling 1976). The decision to use large amounts of foreign funding may generate agency problem between maximizing profits and maximizing outreach. This means that MFIs receiving foreign funding (debt, equity, donations, guarantees) may be forced to respond to funders pressures to operate more efficiently and may therefore choose to serve less poor clients with lower delivery costs, implying mission drift.

Based on the above discussion, the research includes cross-border funding as represented by cross-border commitments in the model based on the following main hypotheses:

**Hypothesis 1a**: Cross-border funding is positively related to financial performance

**1b**: Cross-border funding is negatively related to social performance

**RESULTS**

By using the ordinary least squares dummy approach which controls for unobservable factors (such as regulatory environment, macroeconomic and political stability) the findings show that cross-border funding positively affects average loan size, thereby rejecting the hypothesis that mission drift occurs. The findings also indicate that cross-border funding positively affects financial performance in terms of operational self sufficiency. However, all these significance relationships disappear, once country dummies are accounted for. Due to the fact cross-border commitments is concentrated in two sub regions-West and East Africa, sensitivity analyses were performed to see if the above results might change. The results show that cross-border commitments positively affect return on assets (ROA) only in MFIs in West Africa, while it is insignificant in the other sub regions.

**DISCUSSION**

Using a dataset of 212 MFIs from 30 SSA countries accessed over a three-year (2007, 2009, and 2011) period. The study finds that cross-border funding does not influence either the social or financial performance of MFIs, once time and country effects are controlled for. This could mean that the relationship between cross-border funding and mission drift is not robust. Based on this result, there is no evidence of the occurrence of mission drift. The above findings are broadly in line with the recent findings by Winkler and Martins (2013) in Latin America.

The main limitation of the research is that cross-border commitments data is provided only at the country level and not at the MFI level. Moreover, data for some years are missing (2008 and 2010), since surveys are carried out biennially.

INTEGRATION OF INCLUSIVE CULTURE TO DRIVE INNOVATION AND PERFORMANCE IN UNSTABLE ENVIRONMENT

Gouda, Hanan

International Cooperation, Arab Academy for Science, Technology and Maritime Transport, AASTMT, Alexandria, Egypt

ABSTRACT

Due to globalization of markets and diversification of the work force, managers in any organizations have to face frequently cross-cultural interactions for negotiation purposes or business practices or even within individual interactions.

Any business or organization is responsible for increasing the rate at which technological advances are used within the manufacturing of a product or the delivery of the service they offer, in order to increase their output. Most organizations have faced massive changes and transformations for the purpose of innovation.

To enhance the interactional aspect of the innovation process, the concern is to create a comprehensive internal organizational culture, the progression of personnel competences and organization abilities simultaneously, which is the effective approach to achieve an improved organizational productivity and attain competitive advantage.

Diversity being a key component of accomplishing an innovation culture, it could be an implicit factor proceeding against organizational efforts to raise and strengthen the culture and the processes that support innovation.

The integrated process should be influencing the development of individuals, languages, concepts, skills and behaviors that promote insertion. In a theoretical approach, we are trying to give a perspective of the positive and negative impacts of the culture, which may affect the integration of an innovation process in a multicultural work environment. The objective is to prevent any major conflict or drawback due to cultural perspectives that may restrain the productivity of the organization. The research addresses the problems that faces configuration of insertion concepts and tools in a projected innovation process, focusing on the concept of teams in a work environment within an Egyptian organization at the core of an unstable political situation.

Keywords: Culture, international management, implications to business practices, intercultural interactions, integration, innovation, technology, productivity, cross-cultural, unstable economy, adaptations methods, management challenges.

FUNDING INNOVATIVE SMES OF TRADITIONAL SECTORS

Harel, Ronen; Kaufmann Dan

The Department of Business Administration, Guilford Glazer Faculty of Business and Management, Ben Gurion University of the Negev, Israel.

ABSTRACT

The growing interest in innovative SMEs stems from the fact that they are perceived as a main engine of economic growth and job creation. Still, these companies face obstacles in the form of inaccessibility to funding, especially those companies which are based on knowledge and innovation and whose assets are primarily intangible in nature.

This study points to the funding difficulties of innovative SMEs that operate in traditional sectors ("ITSME") and asks whether current conditions point to the existence of a market failure.

The study explores the financial tools available in Israel and their relevancy to ITSMEs by conducting in-depth interviews with different financial actors who provide financial services. These include venture capital funds, banks, private equity, mezzanine funds and key players from the public sector.

In our study we identify the existence of a market failure relating to the funding of ITSMEs and suggest that the venture capital, private equity, and mezzanine funds models cannot provide adequate funding solutions for ITSMEs in Israel.

In light of the importance of these firms to the economy, governmental intervention is required, if more innovative activity of ITSMEs is desired. To this end, the study suggests a novel funding scheme that ties private equity funds to ITSMEs.

The study contributes to the literature by identifying groups of highly innovative firms operating within traditional sectors and by using a qualitative approach to analyze the relevancy of different financial mechanisms to their needs.

**Keywords:** SME, innovative SMEs in traditional markets, lack of access to finance, market failure, banks, venture capital funds, private equity funds, mezzanine financing, government involvement in SME funding.
DEVELOPING AND TESTING A WORK DESIGN TAXONOMY OF KNOWLEDGE WORKERS’ JOBS

Hernaus, Tomislav

Department of Organization and Management, University of Zagreb, Croatia

ABSTRACT

Organizations are facing increasing workplace diversity and continuously struggle to manage business complexity. Thus, managers and HRM experts are required to design jobs for different employee groups and occupations within today’s hypercompetitive environment. They shape the content, function and relational aspects of jobs by changing a number of design parameters or work characteristics (e.g., Campion, 1988; Cordery and Parker, 2007). As a result, jobs often vary among employees in degree of task overlap, number and nature of tasks performed, as well as in level of interaction and interdependence.

Work design interventions are not a new topic (e.g., Lawler III et al., 1973; Hackman and Oldham, 1980; Parker and Wall, 1998; Holman et al., 2010). The research domain is broad and still evolving, as a wider range of work characteristics has been recently examined (e.g., Parker et al., 2001; Morgeson and Humphrey, 2006; Grant, 2007; Humphrey et al., 2007, Dierdorff and Morgeson, 2013). Nevertheless, past studies were dominantly focused on “individual”, one-dimensional job/work characteristics of non-knowledge workers. However, scholars realized that certain patterns of working practices in general (e.g., MacDuffie, 1995; Ketchen Jr and Shook, 1996) and job/work design bundles specifically (e.g., Fleishman and Quaintance, 1984; Meyer et al., 1993; Morgeson and Humphrey, 2008) capture the complexity of organizational life. Additionally, individuals seem to observe their jobs as patterns of several work characteristics (Stone and Gueutal, 1985). Therefore, a configurational or systems approach to work design should be applied (e.g., Johns, 2010; Munyon et al., 2010). A multidimensionality of work characteristics need be emphasized and studied more systematically (e.g., Parker and Ohly, 2008; Grant et al., 2010).

Although a significant number of work-related or work design configurations have already been identified in the literature (e.g., Drazin and Van de Ven, 1985; Naughton and Outcalt, 1988; Campion et al., 2005; Zoghi et al., 2005; Burton et al., 2006; Cordery and Parker, 2007; Valeyre et al., 2009; Holman and McClelland, 2011; Morgeson and Garza, 2013), the majority of those classifications are typologies of various job quality and work organization issues, and they do not represent “pure” work design configurations. In addition, we still lack empirical insights about work design of knowledge workers – an increasingly important and voluminous group of employees (e.g., Drucker, 1959; Davenport, 2005; Levenson, 2012). Therefore, the main purpose of the present research is to examine the bundling...
nature of work characteristics and to develop the work design taxonomy of knowledge workers’ jobs. In addition, distinct work design clusters are evaluated for performance in order to determine (in)appropriate working practices. The exploratory work design study was conducted on the sample of 512 employees from 48 large-sized Croatian organizations. A cross-sectional and cross-occupational research design was applied in order to include knowledge workers – managers and professionals – from a variety of different jobs, occupations and industries. The data were collected by using the adapted Work Design Questionnaire (see Morgeson and Humphrey, 2006), a comprehensive instrument and a general measure of work design consisted of 65 items on a 5-point Likert-type scale measuring 12 work design variables and 2 outcome variables. The survey questionnaire was focused on gathering perceived task, knowledge and social characteristics of knowledge workers’ jobs and subjective measures of their both task and contextual performance.

A four-step analytical approach was taken. Firstly, the R-mode analysis was conducted. A factor analysis with varimax rotation was followed by a Ward’s hierarchical cluster analysis to reduce the number of job-descriptive elements and identify the desired job-analysis dimensions (see Harvey, 1986). Secondly, non-hierarchical $k$-means clustering method was applied to establish the work design taxonomy. The analysis verified the existence of three-cluster solution that was further described, compared and validated through non-parametric tests for the equality of means. Lastly, determined work design (WD) clusters were analysed separately for managers and professionals, and work performance outcomes of each occupational group were determined and examined.

Work characteristics across WD clusters differ significantly thus validating the proposed taxonomy. The high-enriched jobs were reported within the first WD cluster (N=212; mean range from 3.70 to 4.71) consisted of 57.55% of managers and 35.39% of professionals. On the other hand, low-enriched jobs were present within the third WD cluster (N=72; mean range from 2.53 to 3.51), dominantly occupied by professionals. However, most professionals (46.38%) were classified within the second WD cluster (N=228; mean range from 3.15 to 4.15) and were assigned to handle medium-enriched jobs. Managers in high- and medium-enriched jobs provided the same level of work performance as their professional counterparts. Yet, managers occupying low-enriched jobs were significantly less successful regarding both task and contextual performance outcomes than professionals within the same jobs were.

The present study investigated and confirmed that conventional occupational groups of knowledge workers (managers and professionals) potentially vary within and between each other in the extent and nature of work characteristics. By using a larger number of work characteristics, the work design taxonomy was developed and three WD clusters for knowledge workers were proposed. Both
managers and professionals were significantly represented within high-enriched and medium-enriched clusters, which emphasize the similarity of their jobs. As their jobs and performance do not differ significantly, managerial and professional career tracks can be easily switched thereby improving organizational flexibility and responsiveness. However, this is not valid for low-enriched jobs, as managers are not challenged enough to provide a considerable work effort. In such work environment, managerial jobs should be enriched. Ultimately, the examined relationship between work design configurations and performance outcomes of occupational groups provided useful insights for making work design decisions within the knowledge economy.

TOURISM DEVELOPMENT IN ANGKOR WAT IN CAMBODIA: A WAY TOWARDS SUSTAINABLE SOCIAL AND ECONOMIC DEVELOPMENT IN AN UNDERDEVELOPED COUNTRY?

Homlong, Nathalie1; Springler, Elisabeth2

1Volda University College
2University of Applied Sciences bfi Vienna

ABSTRACT

To promote economic growth in less developed economies, standard economic approaches focus mostly on export driven development strategies and are encouraged by trade agreements. As it was shown already by Singer-Prebisch (see Oately 2010), less developed economies focusing on export based strategies are exporting mostly agricultural goods, which suffer from low income elasticity and cannot achieve sustainable economic development. Furthermore weaknesses of standard economic approaches are visible when looking not only at the experiences of e.g. many Latin American economies, but also at the New Member States of the European Union, which are transition economies. Despite of economic models stating that input factors converge (see e.g. H-O-S models), these developments cannot even be observed in economies of the European Union, which are already regarded as higher developed.

Consequently alternative economic models aim to integrate factors, which are neglected in standard economic approaches (Weissenbacher 2008; Jäger/Springler 2012): space, time and the specific structural and institutional settings of regions and nations.

Models, which focus on structural and institutional settings, are closely related to approaches of Structuralism and Keynesian approaches. These models show the importance of protective measures of national authorities and are critical towards free trade policies. Additional models dealing with the importance of space are closely related to economic geographic approaches. In this respect especially Myrdal’s (1973) discourse, which distinguishes regional backwash and spread effects, sheds light on the dual effects of sector promotion on regional development – including socio-economic effects.

Applying these alternative approaches, the proposed paper aims to critically reflect on the effects of the promotion of the tourism sector in Cambodia. Does the increase of tourism – especially in the region Siem Reap – foster sustainable growth in Cambodia?

The temples of Angkor Wat, which are located in Siem Reap, are among the top tourism destinations in Cambodia. Visitation figures show two-digit annual growth rates, and are now at approximately 2 million visitors per year. Besides the textile industry, tourism is the most important industry in this underdeveloped country.
Tourism development is promoted as a way towards development for the region, and tourism has indeed been creating jobs in Siem Reap. Based on these positive trends the question arises whether the local population is benefitting from tourism development – is Siem Reap experiencing sustainable social development through tourism? This question is investigated with the help of the following indicators: 1. Standard of living, which includes the type of housing, access to clean water and sewage systems of the population. 2. The economic standing of the population, measured by housing prices, food prices and income levels. And 3. Potential for development: indicators related to education, like school enrollment and education levels. The paper furthermore analyses the structure of ownership of tourism related enterprises in Siem Reap (locally or foreign owned). The methods applied are analysis of statistical data as well as interviews with NGOs and tourism associations in Siem Reap.

UNDERSTANDING CELEBRITY TRUST CONSTRUCT, ITS DIMENSIONS
AND ITS IMPACT ON OTHER BRAND RELATED CONSTRUCTS

Hussain, Shahzeb; Melewar, T C
Middlesex University London

ABSTRACT

Trust plays a major role in generating relationships between consumers and brands. Because of trust, consumers’ belief that the brand has qualities that make it unique, competent, consistent, and honest.

In the last few years, several researchers have explored trust within the context of brand management (Delgado, et al. 2006; Soh et al., 2009). However, thorough analysis of literature reveals that there are still wider gaps, which need to be explored further. Recent trends, based on the decrease of level of trust in the context of brand management, also give emphasis to explore trust in more details (Lantieri et al., 2007). One of the areas within brand management context, where trust can be explored further is of celebrity endorsement.

A similar construct to trust i.e. trustworthiness, although, has been an area of interest for many researchers, but previous literature reveals that both trust and trustworthiness are two different contexts, both with different meanings and conceptual characteristics (Morgan and Hunt, 1994; Mayer et al., 1995; Delgado et al., 2006; Soh et al., 2009). Trust is defined as a willingness of a party to be vulnerable to the actions of another party based on the expectation that the other will perform a particular action important to the person or trustor (Mayer et al., 1995; Morgan and Hunt, 1994). This definition of trust suggests that people do not only belief on the source (or celebrity), but also show their confidence and willingness to use that knowledge (appeared from the celebrity) as the basis of their actions (Morrow et al., 2004, Soh et al., 2009). Trustworthiness, on the other hand, refers to the honesty, dependability and trustworthy of the source (Erdogan, 2010). These definitions explain that trust is based on all the three cognitive, emotional and behavioral dimensions (Lewis and Weigert, 1985; McAllister, 1995). Trust is cognition based in that we choose whom we trust, in which respect and under what circumstances, and we base the choice on what we take to be good reasons, constituting evidence of trustworthiness (McAllister, 1995). Trust is also affective based. Affective based trust is generated on the basis of feelings generated by the level of care and concern, the partner demonstrates (Marrow et al., 2004; Johnson et al., 2005). There is a third component of trust, behavioural dimension of trust, which is constituted by the actions that flow from both cognitive and affective trust, and can be described as consequence of, both, cognitive and affective trusts (Johnson and Grayson, 2005). Trustworthiness, on the other hand, is only based on the cognitive dimension of
trust and fails to cover the real meanings (in fact, trust in all other contexts like psychology, sociology, social psychology and in business studies is studied based on both two dimensions).

Researchers have, further, argued that trust between two parties is not only build on cognitive trust or on partner’s reputation, but is also build on the basis of affective trust or feelings, generated by the level of care and concern (or benevolence), which the opposite partner shows. These feelings give rise to the perceived strength of the relationship between partners and are truly important in the context of ‘business to consumer’ marketing, where contractual agreements (compare to other contexts, like, business to business and interorganizational context) are less, and main source of trust is based on the good-will or benevolence, generated by the informant or celebrity (Johnson-George and Swap, 1982; Johnson and Grayson, 2005).

These gaps and confusions give rise to conduct a research and explore trust, further, within the context of celebrity endorsement. Therefore, an exploratory research would be conducted and a celebrity-trust scale would be formed. This scale would, then, be used to examine the influence of celebrity-trust and its both two dimensions on advertising credibility, brand credibility, brand equity and, on performance and reputation of the firm. Findings from this study would help researchers and practitioners to clearly understand meanings of trust within celebrity endorsement context.

**RESEARCH QUESTIONS**

The research questions are:

- What is trust in the context of celebrity endorsement? Is it based on both cognitive and affective dimensions? What are the components in each dimension?

- Whether the developed measurement of trust in celebrity endorsement significantly and sufficiently correlated with other constructs (i.e. advertising credibility, brand credibility, brand equity and, on performance and reputation of the firm)

**OBJECTIVES**

The main objectives are:

- To explore the meaning of trust within the celebrity endorsement context,
- To create a valid and reliable celebrity endorsement trust scale,
To use the celebrity-trust scale and its dimensions to examine the impact of celebrity trust on advertising credibility, brand credibility, brand equity and on performance and reputation of the firm (and some other related variables)

**CONCEPTUAL FRAMEWORK (AND RESEARCH HYPOTHESES)**

Based on above mentioned research questions and objectives, given conceptual framework and hypotheses are given.

(Figure 1. Conceptual Framework)

- Hypothesis 1: Cognitive trust has an effect on Affective trust
- Hypothesis 2: Celebrity trust is based on Cognitive trust, and not on Affective trust
- Hypothesis 3: Celebrity Cognitive trust has a higher effect on Advertising Credibility compare to Affective trust
- Hypothesis 4: Celebrity Cognitive trust has a higher effect on Brand Credibility compare to Affective trust
- Hypothesis 5: Celebrity Cognitive trust has a higher effect on Corporate Credibility compare to Affective trust
- Hypothesis 6: Advertising Credibility has a positive effect on Brand Credibility
- Hypothesis 7: Advertising Credibility has a positive effect on Corporate Credibility
- Hypothesis 8: Brand Credibility has a positive effect on Corporate Reputation
- Hypothesis 9: Advertising Credibility has a positive effect on Corporate Reputation
• Hypothesis. 10: Corporate Credibility has a positive effect on Corporate Reputation

• Hypothesis.11: Corporate Reputation has a positive effect on Corporate Image

• Hypothesis.12: Corporate Image has a positive effect on Consumer Based Brand Equity (CBBE)

• Hypothesis.13: Celebrity cognitive trust has higher effect on CBBE compare to Celebrity Affective trust

METHODOLOGY

To develop a celebrity-endorsement scale, a multi-stage research design would be employed. The design would be modelled after Churchill (1979), and would include his recommended eight steps for developing valid measures of marketing constructs.

These eight steps are:

• Specify domain of a construct,

• Generate a sample of items from literature reviews, surveys and insight,

• Collect initial data,

• Purify the measure by assessing reliability and dimensionality,

• Collect new data,

• Reassess reliability,

• Assess construct validity and

• Develop norms.

These steps are divided into three stages: (1) the identification stage, (2) the reliability stage and (3) the validation stage. In the first stage, the domain of the construct would be specified through the review of literature, based on trust (Step 1). Next, with the help of prior literature, meanings of trust from dictionary and interviews with the consumers, initial pool of items would be generated (Step 2). To confirm the content validity of items (generated from prior literature, meanings from dictionary and
interviews), marketing academics and practitioners would be involved in the process to develop and identify items for the reliability stage.

In the reliability stage, a survey would be conducted (Step 3). The data from survey would be split in two halves. The first half of the data would be analyzed by using exploratory factor analysis (Step 4). Exploratory factor analysis would be used to explore structures of the construct and to spot appropriate items for the construct measurement. The second half (Step 5) of the data set would be analyzed by using confirmatory factor analysis to validate the structure of the measurement items proposed in the first data set (Step 6).

In the validation stage, a new data set would be collected by the survey of a complete different population (Step 7). The data would be analyzed by using confirmatory factor analysis to reassess the reliability of the scale. Concurrent validity of the scale would then be examined by testing if the scale would be able to distinguish between the groups who point out different levels of trust. Construct validity would further be taken based on Convergent, Discriminant and Nomological validity. These tests would be taken to confirm that constructs, which are either related or not related or related positively in the theoretically predicted way, are in reality true.

DATA COLLECTION

Based on the formation of trust scale and testing the hypothesis, both Qualitative research method (first two steps of creation of scale) and Quantitative research method (rest of the steps in the creation of the scale) would be used. Most part of the research, however, would be based on Quantitative research method, apart from first two steps of scale formation, where Qualitative research method would be employed For Qualitative method, interviews with marketing academics, practitioners and consumers would be taken, whereas, for Quantitative method, surveys would be conducted, which would be based on data from consumers. Target population for surveys would be consumers and data would be collected from United Kingdom.

CONTRIBUTION TO KNOWLEDGE

As it’s already mentioned above that the measurement used at the place of trust (i.e. trustworthiness) in celebrity endorsement context is insufficient and lacks in a strong theoretical underpinning. The following study would aim to contribute into the knowledge by providing a sufficient scale and by analysing celebrity-trust with other brand related constructs.

Keywords: celebrity endorsement, trust, cognitive trust, affective trust, corporate credibility, corporate reputation, consumer based brand equity

INNOVATION IN OFFSHORE OUTSOURCING: CONSIDERATIONS UNDER STRATEGIC INTERACTION.

Irfan, Irfan¹; Musau, Andrew²

¹Department of Economics and Business Administration, University of Agder, Norway
²School of Social Sciences, University of Trento, Italy

ABSTRACT

Research in inter firm cooperation has focused on how individual firms can reduce cost and speed up innovation by sharing their respective competencies. Evidence based on empirical research has shown that improvement and innovation is dependent on knowledge sharing and technological transfer which both depend on strategic interaction. Recent research also indicates the classical view that innovation is initiated under the breast of a single entity or vertically isolated R&D units no longer holds. This study addresses essential conditions under which innovation can be mutually created in inter firm cooperation across borders i.e. offshore outsourcing. Offshore outsourcing entails the client (outsoucer) delegating business functions and decision making rights to a vendor (outsourcee) located in foreign location.

We employ insights form Game Theory with respect to vendor-client relationship. This serves as a framework to explain risk, rationality, payoffs and other elements that affect innovations across borders by incorporating open innovation, outsourcing, goodwill and competence trust.

We conduct a longitudinal holistic case study of a leading Pakistani textile and apparel company dealing with some of the world’s leading brands. The analysis focuses on how the company and its main client share resources and technology necessary for innovation under an environment where opportunistic behavior can emerge. This study finds that cooperation in the long term can be sustained if the cost of opportunistic behaviors in the present period is high. In particular if the vendor believes that he stands to gain a lot from future transactions, the he will refrain from acting opportunistically. Goodwill and competence trust also have a positive effect on maintaining client-vendor relationship and can fostering innovation.

Keywords: Innovation, Game Theory, Offshore Outsourcing, Payoff, Opportunistic behavior
IMPLEMENTING LEAN WAREHOUSING BY USING A WAREHOUSE MANAGEMENT SYSTEM AT THE SAME TIME. A POTENTIAL ANALYSIS

Kallinger, Simon

School of Business Department of Management & MIS, University of Nicosia, Republic of Cyprus

ABSTRACT

This WIP paper will give an overview about the current scientific status of Lean Warehousing and up-to-date Warehouse Management Systems (WMS). Lean Warehousing bases on the methods of Lean Production with aiming on increasing of efficiency and effectiveness of warehouse operations. A simple definition for an lean warehouse quoted by Chua and Katayama (2009, p. 3) “…would be a warehouse, that is capable to operate in such manner that the throughput is optimized for warehousing activities”. But it will be shown, that the Lean Warehousing approach doesn’t consider standard functions of up-to-date WMS, which already have lean functions inside and already do increase efficiency in warehouses. Beside the core functions: inventory control, storage location management, order picking, replenishment, receiving and shipping, a WMS offers a wide range of additional features like batch picking and many others which lead to waste reduction according one the leading thoughts of Lean Thinking, which are avoiding waste and continuous improvement (Myerson 2012). So, both Systems WMS and Lean Warehousing aiming at the same goals and this gap will be closed by comparing these set of functions with the proposed lean methods and tools from the literature review to achieve lean operation in the warehouse. Companies who are planning to implement Lean Warehouse should combine it with their WMS in use to get the most potential out of them.

INTRODUCTION

Today’s supply chains have to cope with volatile markets and extremely high customer demands in a highly competitive global market, which allows comparing prices within seconds by the internet. Therefore, companies have to face this challenge and are looking for methods to speed up processes and to do their logistics operation as efficient as possible. Hence lean thinking will be applied in nearly all business operation: Lean Production, Lean Management, Lean Supply Chain and others. The most recent is Lean Warehousing, which tries to adopt lean methods and lean tools for warehouse operations like 5S, KANBAN, MUDA, KAIZEN and JIDOKA just to name a few. There is some academic literature about Lean Warehousing (Spee and Beuth 2012; Sobanski (2009), which explain these tools and describe how to implement and also give a view what to expect and what to avoid in order not to fail. But you can’t find the information about the interaction between Lean Warehousing and Warehouse Management Systems (WMS). Indeed Augustin (2010) states that it will be from a great help, but don’t
speak about the areas in which there is an overlap and also Dickmann (2008) writes that it makes absolutely sense to link a KANBAN Management with a WMS. Already 1997 in volume number 27 3/4 of the International Journal of Physical Distribution & Logistics an article was published about lean logistics by D. T. Jones et al. (1997), which indicated a gap concerning the right operating systems for lean logistics in asking the question “What are the right warehouse types, locations and operating systems for lean logistics?” (D.T. Jones et al 1997, p. 171). This research question already implicate that the usage of the operating system – a warehouse management system – should be used to achieve lean logistics. Until now the academic literature still don’t provides an answer, whether in context with lean logistics, nor with lean warehousing - which is a specified form of lean logistics applied in warehouse operations only.

**DESIGN/METHODOLOGY/APPROACH**

Systematic literature review about Warehouse Management Systems and Lean Management in general and Lean Warehousing in particular was used to attain the latest state of these approaches and methods. Now the research goes ahead with primary research starting with an initial model derived from the findings from the literature review. Further research tactics like interviews, questionnaires, focus groups will be used to gather new information on this topic. These results will then be discussed, compared to the initial model and interpreted to present a new model of lean warehouse implementation by considering WMS accordingly.

**FIRST FINDINGS**

The literature reviews show that the current status of science is still in the state to define which lean methods are suitable for usage in the field of warehousing and which not and to explain how to analyze and how to implement, but without considering WMS. But in fact almost every company with logistics operations uses WMS or an ERP with a logistic module for execution and managing. It was found that approximately 2/3rd of the proclaimed lean tools for lean warehousing could be managed and improved by using corresponding WMS modules like, for example, a forklift guidance system (MUDA), KANBAN, sensors on conveyors (JIDOKA) and JIT etc. Further, it seems that the only thing which is not covered with Standard WMS’s, are methods and tools which deal with personnel management and teamwork, like regular team meetings and tools for process analysis like 5WHYS, VALUE STREAM MAP etc.
RESEARCH LIMITATIONS

This survey doesn’t consider ERP-Systems, which also provide various warehouse management functions and are absolutely sufficient for many companies and many ERP software companies have incorporated lean functionalities, including one-piece-flow KANBAN signals and sequencing etc. So this could be an idea for future research.

PRACTICAL IMPLICATIONS

The outcome of this research could be of great help for software vendors of warehouse management systems to extend their software according the identified gaps between Lean Warehousing and their WMS and to adapt their modules accordingly or to engineer new modules for lean tools for a CIP process. For warehouse manager and Supply Chain Managers it could be also of great benefit to review their warehouse operations and WMS functions to identify on which lean level they currently are. Further, they can use the identified model to plan their lean warehouse project/introduction.

In general the findings would support a sustainable economic development. Bozer states (2012, p. 3) “Although warehouses and distribution centers are vital facilities in a supply chain, applications of Lean in warehousing has been lagging compared to manufacturing and SCM. This created a gap of knowledge for Lean warehousing.”

ORIGINALITY/VALUE

The author will cover the introduced gap by assessing the different lean methods in line with the typical warehouse operations. As result it will end up in a potential analysis, which will be very helpful for managers preparing their decision to implement lean warehousing or even WMS vendors to use it as developing guideline, as well.

MY NAME IS ROLLAND, LOUIS ROLLAND

Karidi, Ioanna; Tzigkou, Dimitra

Technological Education Department of Ionian Islands, Greece.

INTRODUCTION

The conduction of public business activity is subject to rules attributed to the Frenchman Louis Rolland (1877-1956). Louis Rolland, a Professor of the Law School in Paris tried to systematize the basic principles that should govern the operation of a public service in 1938, by creating "Rolland Principles". Rolland's basic principles are: the principle of continuity of public services, the principle of mobility or adjustment and the principle of equality. These principles are worldwide and widely acceptable throughout the business community. The same principles are valid for public contracts as well. The purpose of this article is to discover if Rolland's principles are valid nowadays. The basic questions raised are: Is Louis Rolland diachronic? Are there any applications based on the principles in the 21st century? Are there examples of these principles existing in the case of Greek society?

PRINCIPLE OF CONTINUITY OF PUBLIC SERVICES

The principle of continuity of public services requires constant, or, in other words, without stopping, running services. The State's intervention to cover the deficits of public businesses of mutual benefit aims to ensure continuous operation. Rolland’s first principle was destined to find a typical example of its application in the field of public enterprises two generations later. In the Greek legal system, constitutional provisions guarantee the continuous operation of public services for the whole society. This is the case of "Greek Radio Television" (G.R.T/E.R.T.) which was the first founding member of the European Broadcasting Union (EBU) in 1950. In 11.06.2013, the Greek Government announced the closure of the Greek Radio Television, turning off live the signal of the public channels, shortly before the end of the program that day. The black on the screens that prevailed that day was a unique event in the history of the member countries of the European Broadcasting Union. For this reason, the employee’s union prosecuted a lawsuit to the Government in the Council of State, the supreme administrative court of Greece. The Council of State ordered the suspension of the decision for the closure of E.R.T. only for the parts concerning a) the suspension of the transmission of broadcasting and the operation of websites of E.R.T. S.A and b) the inactivity of the frequencies of E.R.T. S.A. Therefore the Government was forced to proceed with the foundation of a new company to replace E.R.T. This case constitutes a verification of Rolland principle for the continued provision of community service as a public service, like radio and television, despite the fact that the Constitution does not require, explicitly at least, the existence of that kind of service.
PRINCIPLE OF ADJUSTMENT OR MOBILITY

According to the principle of adjustment or mobility, it is necessary that the basic needs of citizens are satisfied, as they are shaped and changed in the framework of socio-economic development. The versatility and adaptability of services are needed to monitor the needs of services of general interest. This situation justifies the changes that occur regularly in public services, which must adapt to technical progress and the evolution of social demand. A Greek example that perfectly reflects this principle is the creation of additional lanes to Attica Tollway. Attica Tollway is a pioneering project constructed on a concession basis and is one of the biggest co-financed road projects in Europe. It constitutes the ring road of the greater metropolitan area of Athens and the backbone of the road network of the whole Attica Prefecture. In Attica Tollway, the public institution called for the creation of an extra lane due to the high utilization of the lane towards Spata as a result of the high resettlement to this area. So, although not foreseen in the relevant contract, the concessionaire was obliged to proceed with widening but with corresponding financial rewards.

PRINCIPLE OF EQUALITY

According to the principle of equality, public companies must respect the principle of equal treatment of citizens. This means that, arbitrary discrimination is not allowed, although differential treatment is possible, if warranted by special circumstances. An essential contractual obligation is imposed between the concessionaires and the users of services even if not explicitly foreseen in the concession contract or in ratifying the convention law. In the case of illegal exclusion of the use of the licensed service, the concessions can file a lawsuit in a court of law, claiming the retribution of financial reconciliation. The public service must be guided by the public interest, without being influenced by private interests. A typical example of application of the principle of equality in the Greek reality is the decision of the Council of State regarding to provisions to families having many children. Members of such families are rewarded with entrance to Universities. The Plenary of the Council clarified that acceptance to Universities is in line with the Constitution “only when the evaluation criteria are purely academic, in other words, the candidates are examined only in relation to their ability in courses and skills relevant to the subject area of the Department of School or School”. According to the above decision, the principle of equality is applied among prospective students without social distinctions between them. The Greek Government is invited to implement this decision.
CONCLUSION

From the analysis of Rolland’s principles and their application in the Greek reality, the timeless of Rolland’s principles is perceived. These principles are applied for the social good and interest. Through these principles, the reasonable functioning of public services for the benefit of social interest is ensured. The above mentioned examples belonging to the Greek society are contemporary and subject to the principles of Louis Rolland. They were chosen because of their great importance in the Greek society. In the future, examination of whether Rolland’s principles are still valid and applicable in the case of the private sectors of Greece and other countries as well can become the subject of a more thorough research.

OPENING THE “BLACK-BOX” OF PLACE-BASED LEADERSHIP.
DECONSTRUCTING THE ROLE OF UNIVERSITY SENIOR LEADERSHIP IN
CITY/REGIONAL DEVELOPMENT

Karlsen, James1; Benneworth, Paul2; Pinheiro, Rómulo1

1University of Agder & Agderforskning
2University of Twente

ABSTRACT

Recent inquiries have brought together the concept of institutional entrepreneurship with the study of change within regional innovation systems (Sotarauta and Mustikkamäki 2011). In so doing, they have shed light on the potential for addressing unanswered queries regarding broader regional development processes by looking at the ‘micro foundations’ (Powell and Colyvas 2008) of city-regions and regional development. Seminal studies following the “old” institutionalism tradition remind us that leadership and power are intertwined (Selznick 1984). One area where these foundations remain to be adequately addressed pertains to the role of leadership and power in local economic development, particularly in the tensions between collective regional leadership (Sotarauta 2007) and ‘happy family stories’ (Lagendijk and Oinas 2005). To address this issue, we therefore seek to: (a) explicate how actors constellate within particular regional contexts to create strategic leadership capacity; and (b) explore how these competitive and co-operative tensions play out in practice. Some scholars conceive of institutional entrepreneurship as a strategic relay of power and knowledge in time (Sotarauta and Mustikkamäki 2011). What is more, power is salient in situations involving a constellation of social actors/networks (Owen-Smith and Powell 2008) either within a given organizational field (DiMaggio 1991) or a specific geographic/governance setting (Charles and Benneworth 2001). Hardy and Maguire (2008: 201) contend that “actors do not ‘have’ power, instead they occupy (or fail to occupy) subject positions that, in turn, allow them to exercise power in – and on – a particular field or regional governance setting.

In this paper, we frame our analysis around one particular set of regional development actors, university senior managers (rectors, vice-rectors, etc.), and explore the roles they play in the construction and evolutions of power fields within particular regional development contexts. In particular, we focus on the subject positions played by university senior managers both in their own internal (university) networks, but also within regional policy and corporate governance processes. The empirical material is drawn from recent qualitative studies on the regional role of universities in Northern Europe – Norway (Tromsø), Finland (Oulu) and the Netherlands (Twente). In each of the three cases, universities have historically been called upon to play an active role in regional
development inter alia by help preventing negative ‘lock-in’ and contribute to regional upgrading by contributing to path-extension and/or creation (Garud and Karnoe 2012). Yet, such processes are politically and normatively laden thus raising conflicts and volitions (Pinheiro et al. 2012). Due to the multiplicity of roles that universities play – within and beyond the region (Benneworth and Hospers 2007) – they are both part of the problem and part of the solution to some of these tensions. Hence, the paper address the following research problem: What role do senior university managers play in shaping regional coalitions and power networks, and what effects (if any) do these have in processes of regional development and upgrading?

Conceptually, we adopt the Strategic Relational Approach (SRA) devised by Jessop (2001) and further developed by Lagendikj and colleagues (Lagendijk 2007; Varró and Lagendijk 2012). SRA assumes that macro-level structures are inherently relational (i.e. rooted in space and time) and, thus, are subject to strategic manipulations by certain agents who, in turn, embark into collective initiatives to (re-) shape such structures at various levels (macro/meso/micro). According to SRA, strategies and practices are the result of ‘structurally-inscribed strategic selectivity’, i.e. they are both a reflection of past events (path-dependency) as well as future trajectories (path-shaping); with actions and solutions becoming discursively mediated and understood against the backdrop of individuals’ natural cognitive limitations or information asymmetries (see Simon 1991). More importantly, this process leads to the rise of new discursive and hegemonic (i.e. uncontested) practices which, over time and as they diffuse, are adopted and legitimated by other powerful agents and organizations, hence becoming regularized and institutionalized in new forms of (local and regional) governance. More specifically, the paper illuminates the kinds of roles that university senior managers play, and interprets them in light of the territorial developmental, regional upgrading and institutional entrepreneurship literatures.

The Future of Entrepreneurship

ELDER EMPLOYEE RETENTION AND RECRUTIMENT IN LITHUANIA:
PREVAILING ATTITUDES AND PRACTICES, PERCEIVED BARRIERS AND
POTENTIAL DRIVERS

Kazlauskaite, Ruta1; Pupieniene, Irena2; Buciuniene, Ilona1

1ISM University of Management and Economics, Lithuania
2AB Vilniaus Baldai, Lithuania

ABSTRACT

The national and historical contexts play a highly relevant role in the understanding of the prevailing attitudes and stereotypes towards diverse groups of employees (Kamenou, 2007; Syed & Özbilgin, 2009); however, so far it has been mainly studied from the Western country perspective, which underlines the relevance of research undertaken in other contexts (Shen et al, 2009; Jonsen, Maznevski & Schneider, 2011).

This paper aims to explore the main factors that affect elder employee employability in Lithuania, which represents the so far under-researched post-Soviet context. It is also noteworthy that elder employees will not only make a major source of labour in the country in the near future due to fast decreasing and ageing overall population. Elder employees (55 plus) also constitute the most widely discriminated social group in the country’s labour market, which is in contrast to the general EU situation, where elder employees do not even fall under the top three most discriminated social groups (Eurobarometer, 2012). It should also be taken into account that elder employees represent a unique labour generation in Lithuania and other Baltic countries, as their educational background and considerable part of work experience date back to the Soviet times. Therefore the paper approaches the elder employee employability issue in Lithuania by seeking to identify employer attitudes to elder employees, prevailing recruitment and retention practices, and perceived barriers and potential drivers in dealing with an ageing workforce.

The study is built on a qualitative approach comprising semi-structured interviews with 20 most senior HR or general managers (where organisations did not have an HR function/position) from different size, industry and sector organisations.

Empirical findings show that no specific, designed/adopted for elder employees in particular, HRM policies or practices related to their recruitment and retention are employed by organisations in Lithuania. Similar to Western countries, negative attitudes towards elder employees prevail in organisations in Lithuania. The reasons behind those attitudes are by and large parallel to those found in other countries; however, a number of specific factors (absence of skills, attitudes to work, personality features) related to the Soviet heritage have been identified too. Besides the study has
determined a number of individual, organisational and institutional-sociocultural level factors (barriers and drivers) that have an impact (positive or negative) on elder employee employability.

THE ROLE OF SOCIAL INNOVATION IN CREATING A METHODOLOGICAL FRAMEWORK ADAPTED TO REALITY

Kchaich Ep Chedli, Mariem; Floricel, Teodora Bianca

The Bucharest University of Economic Studies, Romania

ABSTRACT

This paper presents a methodological framework that can be applied for analysing social innovations in the process of business continuity and can be used by companies to adapt their activities to the current market demands. These innovations are intended for an innovative company, with employees ready for new ideas.

The article focuses on several parts: the first part refers to the concept of social innovation, the second one show how social innovation can be analysed, focusing on methodological aspects and the third part presents the conclusions. Innovation is a complex concept and it cannot be defined without tracking all aspects and interactions which were identified in the innovation cycle.

Given the present economic crises and the low interest in applied social innovation, people tend to choose not making changes in their life and work despite new and innovative ideas; this can be taken as an approach for to avoiding risks and activity disruptions.

As results our expectations merge within the idea that a complex society requires complex answers at all problems and personalised applications of any new theory or idea. Therefore the purpose of the paper is to propose concrete ideas of social innovation that can be easily put into practice.

SPORT SPONSORSHIP: THE IMPACT OF SPONSOR IMAGE ON PURCHASE INTENTION OF FANS

Koronios, Konstantinos1; Psiloutsikou, Marina2; Kriemadis, Athanasios1; Zervoulakos, Pavlos1;
Leivaditi, Eleni1

1Department of Sport Management, University of Peloponnese, Sparta, Greece
2Department of Marketing and Communication, Athens University of Economics and Business, Athens, Greece

ABSTRACT

The purpose of this study is to examine the impact of sponsor image on one major behavioral outcome, fans’ purchase intention. Furthermore, following the sponsorship literature, we explored whether sport activity involvement and team attachment enhance sponsor’s image among football fans. We tested our hypotheses empirically using a questionnaire sent to the fans of a prominent Greek football team. A total of 618 questionnaires were successfully completed and analyzed by means of the SPSS. Our findings show that Sponsor Image has a significant effect on the purchase intention ($R^2=0.813$, $p<0.001$) regardless of the product fit. Sponsor image was weakly linked with sport involvement and team achievement.

INTRODUCTION

Sponsorship is a company’s investment in cash or kind, for creating a business-to-business relationship with a sport team, in order to gain publicity and awareness within a certain target audience, via the support of an activity, not directly linked to their business (Biscaia et al., 2013). Sport is a natural area for sponsorship, given that sponsors are more willing to invest in sport associations and clubs, which have a strong bond with a mass audience, as goodwill toward them is possible to be transferred to the sponsor’s brand or products (Madrigal, 2001). Despite the evident importance of sponsorship activities, academic research has mainly focused on the evaluation of abstract corporate sponsorship instead of actual team sponsors (Biscaia et al., 2013). The purpose of this study is to single out the key variables in the sponsorship relationship, as well as to examine the impact of actual sponsors’ image on football fans’ purchase intention. Furthermore, in accordance with sponsorship literature, the role of sport activity involvement and team attachment was investigated, in enhancing sponsor’s image between football fans.

THEORETICAL BACKGROUND
According to sponsorship literature, it is crucial to investigate whether sponsorship produce some form of benefit to sponsoring companies in terms of fans’ attitudes towards the company itself or their intention to purchase the company’s products (Pope, 1998). Sport activity involvement and team attachment are among the main attitudinal constructs which play a crucial role in the formation of sponsor image and by extension in sponsorship behavioral outcomes, such as purchase intention (Alexandris et al., 2007). Sport activity involvement refers to the degree to which an individual shows interest in a particular sport activity and is positively related to attitude towards sponsors (Biscaia et al., 2013). Team attachment represents a form of psychological connection toward a sports club, refers to the connectedness of an individual’s self-concept and the experience of the sports club’s success and failures as one’s own, and it can influence individual’s willingness to engage in behaviors and attitudes that support the club and by extension, the sponsors (Gwinner and Swanson, 2003). Recent research addressed a variety of attitudinal and behavioral variables, such as sponsor image and purchase intentions, as high level sponsorship outcomes (Alexandris et al., 2007). Furthermore, the relatedness of sponsor’s product fit to the sponsored team has been shown to be an important factor in determining how fans respond to sponsorship (Biscaia et al., 2013). However, research regarding sponsorship effectiveness remains both tenuous and contentious, as the interactions between the proposed variables are complex and dynamic.

METHODOLOGY, RESEARCH DESIGN AND DATA ANALYSIS

The empirical data for this study were collected from a prominent Greek football team’s fan clubs base making reference to its actual current sponsors (Smith, et al 2008). We ran a quantitative research. A total of 618 questionnaires were collected by a team of 5 researchers, and were completed in the presence of the surveyors. We draw our sample from fan club members because they represent a significant part of the entire fan base targeted by sponsors. The method used for the purpose of this research, is consistent with previous studies of similar issues and populations (Smith, et al 2008). A total of 618 questionnaires were successfully completed and analyzed by means of the SPSS

RESULTS, DISCUSSION AND IMPLICATIONS/CONCLUSIONS

Sponsor Image was measured with three distinct variables i.e. corporate image, product/service image and corporate quality. We also measured purchase intention for the products/services of each sponsor. Using single regression analysis, all three independent variables were found to have a significant ($p<0.001$) positive effect with the intention to purchase the sponsors’ products/services. Corporate image and product/service showed a strong effect ($R^2=0.813$ and $0.734$ respectively) whereas the effect of corporate quality was found to be weak ($R^2=0.110$). The correlation between the first two was extremely
strong \((r=0.948, p<0.001)\); therefore, to avoid multicollinearity issues, we ran a multiple regression using only the first one and the corporate quality variable. When examined together, corporate quality was not found to have a significant effect, thus leaving only the effect of the corporate image to significantly explain purchase intention. \((R^2=0.813, p<0.001)\). To control for a possible effect of the product fit, we ran an additional multiple regression analysis using as independent variables the 14 evaluations of each sponsor’s corporate image. All but one were found to have a significant effect on purchase intention with a cumulative \(R^2=0.729\) \((p<0.001)\). When the independent variables were weighted by the respective product fit, the effect on the intention to purchase was found to be much lower. Unexpected as this might be, it may well be evidence of an even stronger effect of sponsor image on intention to purchase.

Fans have the intention to purchase the products of their team’s sponsors even when they are not specifically interested in the product category they belong. This is certainly a proposition that needs to be further researched. Sport involvement was found to have a significant positive correlation with the sponsor image, although weak \((r=0.25, p<0.001)\). In regard to sponsor image, a small differentiation was also found between those who watch their team’s matches alone and those who watch them publicly (in the field or at a café) with friends. The latter have a more positive opinion for the team’s sponsors.

Team achievement was not found to be significantly linked with sponsor image. Team attachment was found to have a significant \((p<0.001)\) but weak positive correlation with sponsor image.

**Keywords:** Sponsorship, sponsor image, purchase intention, team attachment, sport involvement

INCENTIVISING EMPLOYEE SUSTAINABILITY BEHAVIOUR THROUGH
HUMAN RESOURCE MANAGEMENT

Leidner, Sarah

University of Southampton (UK)

ABSTRACT
Organisations have realised the need to ensure long-term survival in the external environmental and social environment. The reasons for this can be attributed to a changing and more environmentally aware society, which can put enormous pressures on policy makers, institutions and organisations alike. Indeed, organisations have begun to implement measures that reduce the impact on the natural and social environment, not only to comply with legal obligations, but also to gain competitive advantage (del Brio et al., 2007). However, the problem of how to instigate sustained environmental behaviour change at all levels in the organisation is one that is yet to be successfully addressed (Jackson et al., 2011). This presentation aims to provide an overview of the literature surrounding sustainability behaviour through sustainable Human Resource Management (HRM) in order to develop a better understanding of the role of HR in developing sustainability-driven behaviour change among employees. The extant empirical and theoretical evidence in these areas of research are brought together and the gaps within the literature are identified. Furthermore, this presentation will report on the initial results of a planned study into the challenges organisations are currently facing in achieving increased sustainable practice in employees and outline the planned methodological approach for the next stages of this research project.

SUSTAINABILITY THROUGH HRM
HRM bears a high potential to strategically embed sustainability commitments into all levels of the organisation. Daily et al. (2003) identified that improved environmental performance should be supported by human resource practices. Wilkinson et al. (2001) emphasised that if sustainability resides within HRM, a more holistic and long-term perspective and application would be beneficial. Furthermore, the authors (ibid, p. 2144) state that ‘motivating and encouraging employees to assume a proactive environmental posture becomes the new objective of the human resource strategy’. Indeed, the literature highlights that after the development from personnel management to HRM to strategic HRM, the next stage in the evolution of HRM would be sustainable HRM. Further research that addresses these emerging new paradigms for HRM is needed, particularly to develop a better understanding on how it can improve sustainability behaviours of employees and organisations.
Filling the gap identified by exploring the ways in which sustainability can be implemented through HRM perspective forms an important part of this study.

The greening of HR depends on the strategic integration of sustainability aspects into the overall business strategy and on management support. Through HRM, the general policies and practices of an organisation can be aligned to the organisation’s wider sustainable development objectives, which are considered fundamental in achieving these. Research carried out in Brazilian manufacturing companies indicated that managers perceive some HR activities as more promising to achieve environmental management objectives than others (Jabbour and Santos, 2008). This could be the case because individuals feel more inclined to espouse activities they deem meaningful. This perspective indicates that the underlying success factor for sustainability issues could reside within the behavioural intentions of organisations and employees. Therefore, the study aims to explore behaviour constructs that can have an effect on sustainability initiatives.

ENVIRONMENTAL TRAINING

Environmental training (ET) can be seen as an antecedent to increased sustainability behaviour in organisations. An extensive and systematic analysis of the extant literature in the area of ET was conducted by Jabbour (2013). The work includes a comprehensive list of the most relevant published papers in this area and, as a result of the analysis, the author provides suggestions for future research considering a variety of factors such as national context, sectors, methodologies, analytical tools, focus on ET, phases and benefits of environmental management (EM). The extant literature is mainly conceptual or exploratory and there is a paucity of research that focuses on integrating and systemising the acquired knowledge in this area. Potentially, this knowledge could help organisations to implement ET and manage more strategically and coherently with the overall business strategy.

GREEN BONUSES

To promote sustainability behaviour on an individual level, organisations can embed sustainability aspects into their bonus systems, and thus, motivate employees to achieve the desired behaviour by offering financial incentives. It has been highlighted that for some companies, because it is relatively easy to perform well in the area of sustainability, these kinds of bonuses could be used as an easy way of ensuring extra income in exchange for little effort (in Kolk and Perego, 2013). Furthermore, external benchmarks have been subject to extensive criticism in terms of reliability and relevance. This shows that research in green bonus schemes is still nascent. Thus, this presentation will report on relevant organisational examples from a pilot study, which informed the choice of a mixed-methods approach.
SUSTAINABLE BALANCED SCORECARD

It is claimed that there is a misconception about the benefits of pursuing a sustainability agenda (Nidumolu et al., 2009). The authors state that CEOs mistakenly ponder the benefits against the costs of implementing sustainability, because their research shows that ‘sustainability is the mother lode of organizational and technological innovations that yield both bottom-line and top-line results’ (Nidumolu et al., 2009, p. 2-3). In other words, pursuing a sustainability agenda goes beyond breaking even financially, which is often a reason for rejecting initiatives. Some organisations have already realised the potential long-term benefits of a sustainability agenda and begun to treat it as an integral part of their performance management systems. For example, Royal Dutch Shell PLC have created and implemented a balanced scorecard system for executives that includes environmental properties and that has a direct effect on annual bonuses (Hua, 2011). Thus, empirically testing if sustainability aspects of a balanced scorecard system in particular could incentivise sustainability behaviour in employees forms an important part of this on-going study.

FINDING NEW WAYS TO MOTIVATE KNOWLEDGE WORKERS: WHY GAMIFICATION CAN BE A SOLUTION

Mæhle, Natalia

SNF Centre for applied research at NHH, Bergen, Norway

ABSTRACT

As the global economy is moving into the knowledge-intensive direction and a new breed of knowledge workers (so called digital natives) is on its way, there is a need for intensive management innovations. To address this issue, the goal of the current paper is to explore an innovative way to motivate knowledge workers, i.e. gamification. Gamification – the use of game elements and game design techniques in non-game contexts, e.g. in workplace environments – has the potential to combine the intrinsic motivational factors and digital technologies to address the new generation of knowledge workers. By invoking cognitive intrinsic motivations (e.g. feelings of mastery) and using the social aspects of games, gamification is able to induce an increase of engagement and motivation, stimulate creativity, and improve learning processes and knowledge diffusion. In the current paper, we evaluate the state of research on the use of gamification in business context and study the examples of employing gamification for motivating knowledge workers.

As the global economy is moving into the knowledge-intensive direction and a new breed of knowledge workers (so called digital natives) is on its way, there is a need for intensive management innovations. Knowledge workers are those who “think for a living” (Davenport, 2005, p. 10), and they cannot be “managed” in the traditional way because they resist a command and control culture (Horwitz et al., 2003). Digital natives pose additional challenges to management as they bring with them both unique knowledge of digital technologies and higher requirements for applying it in the workplace. To address this issue, the goal of the current paper is to explore an innovative way to motivate knowledge workers – gamification, i.e. the use of game elements and game design techniques in non-game contexts, e.g. in workplace environments (Werbach and Hunter, 2012). We evaluate the state of research on the use of gamification in business context and study the examples of employing gamification for motivating knowledge workers. Due to the limited research on gamification, this study acts as a starting point for further exploration of the use of gamification in the workplace.

There have been many studies looking on the motivation of knowledge workers. Their main idea is that use of extrinsic motivation (e.g. promotion, bonuses or an increase in salary) is not very effective strategy for managing knowledge workers (Horwitz et al., 2003). Creative motivation often stems from intrinsic factors such as curiosity, satisfaction, and positive challenge (Amabile, 1996). Therefore, the factors that are important in motivating knowledge workers include challenging work, creating a work
culture permitting relative autonomy, celebrating achievement and developing a sense of purpose, direction and excitement (Horwitz et al., 2003).

Using games in the workplace is not completely new. The use of role-playing games in team building and “Employee of the Month” contests have been there for a long time. However, gamification takes it up to a new level and employs digital technology to add “gamefulness” to existing systems and make the everyday work experience more exciting. Companies can use gamification in various ways. For instance, they may motivate employees to provide process or product improvement suggestions with levels, points and leaderboards. Or they may add a series of fun “missions” to boost participation in their professional development programs (as Deloitte Learning Academy did). The gamified solutions enable goal-setting by providing objectives, rewards, tracking, and monitoring the given activities and in this way invoke cognitive intrinsic motivations, e.g. feelings of mastery (Werbach and Hunter, 2012). The social aspects of games are also an important driver of motivation. Employees can collect badges, rise in high-score lists and collect points for social reasons, such as receiving recognition. Moreover, knowledge workers value their knowledge and do not share it easily. Companies need to provide necessary incentives for knowledge sharing. A game community based on the virtual interaction among its members can promote the necessary information exchange, social learning and viral diffusion of knowledge. The research shows that gamification increases and improves social cohesion by strengthening relationships and mutual trust (Galetta, 2013).

Many companies have already employed gamification, and it is predicted that by 2015 50% of organizations will gamify their processes (Gartner, 2011). For instance, Google employees are encouraged to play during their lunch break by betting fake money, Goobles, on certain outcomes as part of a company-wide predictions market. Google believes that it helps to generate creative ideas and encourages Google employees to work harder to achieve a certain outcome they have predicted. Canon’s repair technicians learn by dragging and dropping parts into place on a virtual copier. Cisco has developed a simulation game called myPlanNet in which players become CEOs of service providers, and adopted gaming strategies to enhance its virtual global sales meeting and call center, lessening call time by 15 percent and improving sales between 8 percent and 12 percent.

However, in some cases gamification may promote competition and individual achievement while complex business problems need cooperation (Spencer, 2013). Designing an effective gamified solution requires informed application of game design. It is important to use right game elements in a right way to create a unique game experience, which is fun, engaging, and motivating. More research on how to apply gamification in the workplace environments is necessary.

GUIDED EFFECTUAL ENTREPRENEURSHIP: A TRIZ-BASED APPROACH

Malefane, Lebusa
Centre for Innovation & Entrepreneurship, Vaal University of Technology

ABSTRACT

The theory of effectuation advances a decision process employed by entrepreneurs that differ substantially from traditional views of decision-making, dealing with uncertainty and managing risk. Entrepreneurs that employ this theory develop the capacity to take decisions under conditions of uncertainty and take calculated risks when approaching markets. However, the theory of effectuation was developed on the basis of expert entrepreneurs (Sarasvathy 2008) and has not been sufficiently modified to deal with novice entrepreneurs within the Small to Medium enterprises.

In modifying effectuation, we used a heuristic problem-solving technique called TRIZ theory to assist novice entrepreneurs in the space of small to medium enterprises. TRIZ is a powerful creative problem-solving technique that has proved useful in guiding decisions and actions in complex engineering projects (Savransky 2000, Rantanen and Domb 2002, Polivinkin 1995, Pitso 2013).

In this presentation, we share the conceptual and theoretical framing of the guided decision-process approach employed by novice entrepreneurs that have been selected purposely from a pool of community members that have been explicitly trained on this guided decision process approach. This mainly qualitative study makes use of vignettes to present the results of the observation, semi-structured and videotaped data drawn from three budding entrepreneurs that were seed-funded on the basis that they made use of the guided decision process approach.
CORPORATE ETHICS AND KNOWLEDGE SHARING: ARE THEY RELATED?
THE MODERATING ROLE OF ORGANIZATIONAL JUSTICE

Mavromati, Marina; Dimitriades, Zoe

Department of Business Administration, University of Macedonia, Thessaloniki, Greece

ABSTRACT

In recent years, knowledge has been recognized as a fundamental resource of competitive advantage conducing to corporations’ sustainability (Chan and Chao, 2008; Wong, 2005). The process of knowledge management includes a number of activities, but the most frequently discussed is knowledge sharing (Ford, 2001 in Al-Alawi et al., 2007). Highlighting the importance of this resource, Lin (2007) notes that organizations’ moral challenge is to manage it effectively while the unwillingness towards knowledge sharing should be regarded as a crucial ethical issue (Lin, 2007; Lin and Joe, 2012). Indeed, Styhre (2002, p.232) proposes that knowledge-based economy is founded “on the ethics of sharing, an ethics of giving”, while Baskerville and Dulipovici (2006, p.6) argue that in an economy of sharing “employees share knowledge as a form of self – expression”.

In previous studies, organizational justice was found to affect knowledge sharing via trust or organizational commitment (Lin, 2007; Fang and Chiu, 2010; Schepers and Berg, 2007; Oldham, 2003 in Cabrera and Cabrera, 2005). In addition, De Long and Fahey (2000) highlight the role of culture suggesting that an ethical and trusting organizational culture acts as a facilitator to the knowledge-sharing process (Ruppel and Harrington, 2001; McDermott and O’Dell, 2001; Bock et al., 2005).

In the proposed theoretical framework organizational justice is examined as a potential moderator of the relationship between knowledge sharing and corporate ethics. Previous studies in Greece have focused on organizational justice (Palaiologos et al., 2011; Coyne et al., 2013), knowledge sharing (Brachos et al., 2007; Chatzoglou and Vraimaki, 2009) and ethics (Kavali et al., 2001; Peppas and Peppas, 2000) but not on the relationship among these three variables. The paper aims to contribute to the knowledge sharing literature by suggesting potential drivers in an economy of sharing.

Keywords: Knowledge sharing, organizational justice, corporate ethics, Greece.

WELLBEING: FROM AN ILLUSORY MODEL TO A TANGIBLE RESERVE

Mihoreanu, Larisa1; Viciu Tania Georgia1; Bondrea Aurelian2

1The Bucharest University Of Economic Studies, Romania
2Spiru Haret University, Romania

ABSTRACT

Wellbeing is a multifaceted artificial conception that depicts the satisfaction of persons contained by an area or economy, and subsequently, its development characterizes one of the uppermost and most challenging goals for politicians. The toil in measuring and controlling this variable stands in determining its relationship with additional time-honoured and perceptible financial, political or societal meters. As a consequence, the paper strains to outspread the variety of pointers by propositioning and empirically testing the relation that occurs amid the level of quality of life and the value added by services to total GDP.

INTRODUCTION

Quality of life represents an interdisciplinary topic that was developed in order to understand and mitigate the social and economic problems both at national and individual levels. The types of relations that exist between this concept and economic, political and social indicators, both in the form of prerequisites or consequences, are significantly complex and insufficiently studied.

The paper continues on the trend of supporting the importance of including population measures in the estimations of quality of life indicators, rather than simply developing an indicator based solely on economic indices. Nevertheless, the impact that quality of life has on the development of an economy, and the opposite function, continues to represent a unresolved scholarly debate with potentially important effects on the creation of future strategies.

Recent studies stress the importance of these indicators and their rising influence on the development and implementation of public policies. David Cameron’s speech given in 2006 at the Google Zeitgeist Europe Conference illustrates the political approach toward quality of life concepts. Cameron, then a member of the British opposition party, stated that “improving our society’s sense of well-being is, […] the central political challenge of our times”. Therefore, quality of life studies represent a topic of interest that can play an active role in public policies. Previous scientific debates have portrayed these indices as tangible, rather than illusive concepts, which can be used as a proxy for implementing such policies.

The current discussion deals with the impact that the structure of an economy can manifest on the general quality of life experienced by the population and the possibility of considering the
“tertiarization” of an economy as a prerequisite for increasing the general well-being of the population.

In this manner the article strives to justify the possibility of viewing the economic restructuring as a comprehensive indicator for determining, understanding and predicting future levels of quality of life.

**LITERATURE REVIEW**

The concept of quality of life can be defined from three approaches, comprising normative ideals, experience of individuals and satisfaction of preferences (Diener and Suh, 1997). While the first two approaches are difficult to quantify and assess, they have a strong impact on the final result, in the form of the well-being perceived at individual level. The determinants for the quality of life can be either objective or subjective. Objective indicators, comprising economic, political, health related aspects sum up the opportunities for achieving a specific level of well-being in a given region at a certain time, however, not the actual level perceived by individuals (Costanza, 2008). The way in which people experience their needs, hence, the quality of their lives, is ultimately subjective (Ekins and Max-Neef, 1992). Thus, the analysis of statistic indicators, if possible, has to be complemented by a comprehensive assessment based on direct communication with individuals.

That being said, the latter of the three approaches proves to be more tangible, being widely accepted and utilized by policymakers, as it incorporates the economic notions of utility and efficiency. Moreover, previous findings suggest that subjective well-being is consistently correlated with the level of income across nations (Diener and Biswas-Diener, 2002).

Nevertheless, studies have pointed out that indicators such as GDP per capita are insufficient in predicting the level of quality of life, as other factors in the form of measures of poverty, inequality, health status, education status, gender bias, empowerment, governance and subjective well-being play a significant role (McGillivray, 2005). Assessing the quality of life solely through this economic indicator proves to be a flawed undertaking as GDP per capita disregards the income distribution in any economy. Furthermore, GDP was never intended as a measure of population well-being, representing merely the tally of products and services bought and sold in a given period (Cummings et al. 2003, 160).

Thus, the current discussion will emphasize the importance of determining other economic and development indicators that could help describe and predict the level in quality of life across economies.

There are arguments to support the notion that the “natural process” of human society evolution implies an unavoidable transformation from agricultural based activities to industry and ultimately towards services (Cheng and Blanchard, 2009). Since the middle of the twentieth century studies
indicated that most, if not all, of the world developed economies were shifting their focus from industry and were fast becoming predominantly services based (Fuchs, 1969).

The migration of labour and capital from agriculture and industry to the services sector has altered consumption patterns as well as many population measurements. The tertiarization of economies has been synchronized with a sharp rise in female employment and, as a consequence, has generated further demand for services. This phenomenon takes place as households with working wives have been shown to spend increased percentages of total income on the acquisition of services (Fuchs, 1980).

While there are telling differences between the concepts of quality of life and standard of living, the latter representing a great component of the former, their assessment can be seen as being intertwined. Changes in the economic structure and the evolution of average productivity have influenced the standard of living in the last decades and concurrently have dictated shifts in terms of improving the quality of life (Easterlin, 2000). In the last three decades of the twentieth century, at the end of the tertiarization process in the United States, the average productivity has grown sharply, leading to new levels in quality of life. As a telling measurement of this phenomenon, the necessary working hours for an average individual to acquire a new television set shifted between 1974 and 1994 from 3 weeks to 3 days (Templeton, 1999).

**DISCUSSIONS**

Either directly or in mediated forms, the structural change of an economy, through the increased role of the services sector, both in terms of employment or productivity can be perceived as having a significant impact on the well-being of individuals.

The quality of life index, as already computed by well-established institutions, represents a synthetic indicator constructed from a combination of economic, social, political and environmental datasets. Its relevance can be tested by observing the correlation it generates in relation with other well established indicators which were not utilized in its initial formation.

Through an empirical approach, the relation that exists between the value added by services as percentage of GDP and the quality of life index can be assessed. By using dataset provided by the World Bank and the International Living Quality of Life Index for the years 2009 and 2010, the results can be identified for a number of 148 and 123 nations respectively. The exclusion of economies from the analysis was performed solely on the basis of lack of information for the chosen time frame. The main hypothesis tested states that the larger the contribution of services to GDP, the higher the level of quality of life becomes.
The results for the first year (see Table no.1) indicate a correlation coefficient of approximately 0.68 which can be tested for a level of confidence corresponding to 99%. As the regression involves a single independent variable, the coefficient of determination, has the same value as the correlation, implying that 68% of the variation in quality of life can be supported by the variation of the value of services in overall value of GDP.

</table>

The plot chart, while being slightly more spread out, retains the basic shape of a linear function (see Figure no.2).

Figure no.2 Plot chart describing the relation between services percentage in GDP and the quality of life index across countries in 2010.

The results for the two cross-section analyses support the existence of a linear function in the form of:

\[ Y = 30 + 0.45X \]  

Equation (1)

Where: \( Y \) represents the quality of life index;

\( X \) represents the value added by services to GDP (in percentages).

According to the initial findings, this relation can be used to predict changes in quality of life levels based on the evolution of economies in terms of services to GDP. As most developing countries are still fully engaged in a process of transition from agriculture and industry towards services, their future quality of life is expected to grow. Thus, special interest arises in the case of nations that are still relying predominantly on industry and manufacturing while concurrently manifesting little success in bolstering their service sector.

**CONCLUSIONS**

Quality of life represents a complex concept describing the average level of satisfaction, fulfilment and security. While subjective measurements are vital in describing individual perception, policymakers...
rely predominantly on objective indicators, as they are easily and comprehensively quantifiable. Previous studies point out that economic indicators like GDP per capita and other income values, while being extremely necessary in developing policies, are not sufficient in describing the phenomena. Thus, other realistic and tangible indicators have to be identified and tested, as to widen the range of tools which could be used in assessing and predicting quality of life.

The current discussion identifies a significant relation between the value added by services to GDP and the quality of life index, characterized by a linear single variable regression, a correlation coefficient of 0.68 and a level of confidence of 99%.

The discussion can be augmented by incorporating more cross-section years and possibly identifying more economic structure indicators to the relation.

ASSURANCE LEVEL FOR SUSTAINABILITY REPORTING: EVIDENCE FROM GRI

Moggi, Sara¹; Pagani, Alessandra²

¹Department of Business Administration, University of Verona, Verona, Italy
²Department of Business Government Philosophy Studies, University of Roma Tor Vergata, Roma, Italy

ABSTRACT

Sustainability reports have become a part of the disclosure of companies. As shown in a study by KPMG (2013), the number of sustainability reports accounts for 93% of the companies in the G250 index. Despite the importance demonstrated by the increasing attention paid to sustainability reporting, with few exceptions (see the France Law 77/69 of 1977, which introduced the requirement of a social report for companies with more than 720 employees; this number was decreased to 300 in 1982), this practice is not mandatory by law. There are conflicting opinions about the mandatory publication of sustainability reports. Manetti and Becatti (2008, p. 289) stated that this gap “could be bridged by means of generally accepted principles for sustainability reporting, above all if the public authorities were to intervene with ad hoc legislative provisions.” On the other hand, a wider range of standards and improved flexibility of the tool would favor the extension of its use to several contexts and industries (Kolk, 2004).

Despite the increasing diffusion of sustainability reporting, it is still considered a secondary tool and is not used by shareholders, lenders, customers, employees, or local communities (Gray, 2001). However, in the post-Enron era, companies have an increasing need for transparency in order to regain the trust of their stakeholders. In fact, the financial crisis has increased the attention paid to the quality of a firm’s information and the transparency and credibility related to the management’s activities. To fill the gap of credibility, it is necessary that a professional third party, as a professional, guarantee the disclosure of the sustainability report. The survey recently published by KPMG (2013) indicated that the number of assured reports has increased. This survey revealed that the percentage of G250 companies that published a sustainability report and decided to invest in external assurance rose from 46% in 2011 to 59% in 2012. Furthermore, two out of three of these companies choose to employ one of the Big 4: accounting firms. This result is consistent with the assumption that the auditor is a third party that cuts the agency costs related to the financial statement prepared by managers (Jensen and Meckling, 1976; Krishnan, 2003). Hence, the perceived reputation and assurance competencies of the Big 4 accounting firms have propelled them to their dominant position in the global market with regard to the assurance of sustainability reports (O’Dwyer, 2011).
This rising trend is also demonstrated by the attention paid to sustainability reports by several accounting international institutes, which, in recent years, have published a few documents for guide auditors in the assurance role. Previous studies (Junior Mori et al., 2014; Manetti and Becatti, 2008) found that the two international assurance standards ISAE 3000 (IAASB, 2011) and AA1000 AS (ISEA, 2008) are the most frequently used. In January 2005, the International Auditing and Assurance Standard Board (IAASB) issued the ISAE 3000. It addresses qualified accounts auditors, and it concerns the external verification of non-financial reports. The ISAE 3000 identifies two different levels of assurance: reasonable assurance and limited assurance. Instead, the Institute of Social and Ethical Accountability (ISEA) published the AA1000 AS in March 2003. The AA1000 AS provides practitioners with a methodology to evaluate how and in which measure a company tries to identify, prioritize, and respond to its sustainability issues. Both assurance standards were updated in 2011 and 2008, respectively.

Researching the main differences in the users of the two standards, previous studies found that the ISAE 3000’s definition of assurance is more technical than that of the AA1000 AS. According to Junior Mori et al. (2014), non-accounting professionals are likely to use the AA1000 AS framework, and accounting firms prefer ISAE 3000.

This paper aims to build on previous studies on assurance standards and assurance quality levels by performing an in-depth analysis in light of the materiality principle in sustainability reporting. In our analysis, we consider private companies that published their reports in the Global Reporting Initiative (GRI) database in 2013. To access the most complete and up-to-date database, we asked GRI directly to download an extraction on 20 March 2014. We analyzed all reports published by 189 private companies with levels A+, B+, and C+, which were checked by GRI and assured by an external independent entity. Despite the findings of previous studies that considered only the A+ level, we believe that according to the new GRI G4 guidelines, the level of accountability follows the principle of materiality. Therefore, it is not directly linked to the number of indicators provided. The materiality principle entails the quality of the report’s accountability and not the number of indicators afforded (GRI, 2013).

Based on our review of the previous research on sustainability report assurance, we decided to apply the analysis framework built by Manetti and Becatti (2008) because it was inspired by the ISAE 3000 assurance standard, which is the major standard used by auditors and professionals. We conducted a qualitative content analysis, which was completed separately by both researchers. In the case of ambiguous findings deriving from the content analysis of each document, we reached a common result by applying triangulation to other related documents directly downloaded from the company website. The content analysis of the 189 documents allowed us to identify the following aspects:

- World Region (Kolk and Perego, 2010)
- Type of assurance provided (accountant, small consultancy, and engineering firm)
- Assurance provider (Big 4/Non Big 4) (Simnett et al., 2009)
- Stakeholders panel provided or expert opinion
- Parts of report assured (Deegan et al., 2006)
- Level of assurance (combination, moderate, reasonable, high, and not specified)
- Use of ISAE 3000 and/or AA1000 AS

We may add further aspects of the analysis, depending on the second phase of the content analysis, which, following the qualitative method proposed by Mayring (2000), is carried out in two times. The main idea is “to give explicit definitions, examples and coding rules for each deductive category, determining exactly under what circumstances a text passage can be coded with a category. Those category definitions are put together within a coding agenda” (p. 270). In the first step of the qualitative content analysis, we defined a wide set of open labels of the main aspects analyzed in the previous studies on sustainability report assurance. In the second phase of the content analysis, we merged and enriched the complete collection of labels found by the two researchers in the previous phase and identified definitive labels to use in the second round of the content analysis of the reports.

The first results showed that the majority of the reports GRI checked (53.45%) were not assured. According to Mock et al. (2009), the reason could be the costs related to this service. On the other hand, as underlined by De and Sen (2002), these costs could be recovered by the increased credibility of the company for stakeholders.

Simnett et al. (2009) found that factors of country and industry have a significant relation to the demand for assurance in voluntary reporting. Regarding the region, the analysis revealed that most of the assured reports were from European companies (49.21%). According to Simnett et al. 2009) in common-law countries, companies are shareholder-oriented, but in code-law countries, companies prefer a stakeholder-oriented approach. Regarding the factor of industry, several authors (Manetti and Becatti, 2008; Junior Mori et al., 2014) demonstrated that because the mining, production, utilities and finance industries are more exposed to social risk, companies in these sectors pay increasing attention to the credibility of their reports and to assurance conducted by a third party. The majority of the sample analyzed (73.54%) was composed of A+ level assured reports. Regarding the type of assurance provided, 69.31% of the sample was supported by accountants. In particular, companies at the A+ level used the services of the Big 4 auditing firms. Moreover, the lack of a mandatory regulatory framework for the assurance of sustainability reporting has led to competition between auditors and consultants/advisers (Simnett et al., 2009; Zorio et al., 2013).
The findings of this study provide evidence of the current state of the assurance of sustainability reporting, bring the results of previous studies on this topic up to date, and show a unique picture of the practice of assurance after the financial crisis.

This study is the first step in a large research project that includes further analyses of the data collected. A later stage of this research will investigate the reasons that drive the compliance with assurance in sustainability reports from the points of view of both managers and accountants.

FINANCIAL MARKETS VOLATILITY AND INVESTORS' BEHAVIOUR: ANTECEDENTS OF SMALL INVESTORS' RISK TAKING PROFILES

Mouzoura, Georgia
Faculty of Business, Education and Professional Studies, University of Gloucestershire, UK

ABSTRACT

Risk and uncertainty play a role in almost every important economic decision. As a consequence, understanding individual attitudes towards risk is intimately linked to the goal of understanding and predicting economic behavior. Significant research has attempted to identify the determinants of risk tolerance. In the past years, numerous studies have attempted to identify the demographic factors that determine risk tolerance. The proposed study aims at examining, under the behavioural finance perspective, the drivers and antecedents of individual investors' risk-tolerance profiles for which little is known, so far. Research, up to date, examines investment risk tolerance mostly in terms of individuals' demographic characteristics. However, nothing is published on the effects of culture. This study will attempt to narrow this literature gap for the benefit of all parties concerned; academia, financial services firms and investors. Theoretical and practical implications of this research are also discussed.

INTRODUCTION

Any investor is exposed to risk given that there is uncertainty about the financial outcome of the investment. In this light, investor risk tolerance can be seen as ‘the extent to which an individual chooses to risk experiencing a less favourable financial outcome in the pursuit of a more favourable financial outcome’ (Davey 2002), or the level of uncertainty that an investor is comfortable with in regard to investments. Whether measured for the purpose of self-assessment or for documentation of investment suitability, financial risk tolerance is assumed to be a fundamental issue underlying a number of financial decisions. Risk tolerance is an extremely complex phenomenon that is studied by disciplines such as economics, psychology, finance, and management science (Roszkowski, 1993). In this study, we use the definition from the finance literature. Risk is measured by the investment volatility. Risk tolerance refers to people’s attitudes and behavior regarding financial risk (Roszkowski, 1993). Review of the literature in the area of the individual’s investment risk attitude shows several underlying factors that determine the level of risk tolerance. Among the most important socioeconomic factors are gender, age, and wealth. It is amply documented that risk is a factor that shapes individuals’ decisions, including financial and investment decisions, (Lipe, 1998; and Yang and
Qiu, 2005). Thus, understanding the factors that determine risk attitudes is imperative in understanding individuals’ decisions. Determinants of risk attitudes of individual investors are of great interest in a growing area of finance known as behavioral finance. Behavioral finance focuses on the individual attributes, psychological or otherwise, that shape common financial and investment practices, (Ritter, 2003). Despite great interest in this area, not much research looks at the underlying factors that may lead to individual differences and play a significant role in determining people's financing and investment strategies in emerging markets. In this latter approach cultural theory has been important. This paper uses new data and new methodology in an attempt to address some of the challenging questions surrounding this concept.

**DESIGN/APPROACH/METHODOLOGY**

In this research investigation a deductive approach is applied. A substantial body of knowledge in the research area of market volatility already exists. In addition, the decision for the development of a theoretical framework and hypotheses was informed by the literature review making the deductive approach possible in this study. Furthermore, all theories described in the theoretical framework will be compared to the empirical findings of the study. The research will adopt different methodological tools for its different aspects, combining quantitative with qualitative methods, as well as primary data and secondary data. That mixture of data is essential for the successful achievement of the objectives required for this research.

Secondary data from an extensive literature review in order to construct a solid theoretical base on which empirical research will be designed and helps to access the techniques used by other researchers, to formulate appropriate testable hypotheses and built the research instrument regarding: volatility of published market data, interconnections between market volatility and risk-tolerance of individuals, under the perspective of behavioural finance, culture and its consequences, with a special focus on risk-tolerance in general and investment risk-tolerance in particular, effects of demographics on risk-tolerance.

Examining the drivers and antecedents of the small investors' risk taking profiles considering factors such as demographic characteristics i.e. gender, age, occupation etc psychological and cultural values, will be done by collecting data that will measure the risk and cultural profiles and can statistically be analyzed to give valuable results on the relationship between respondents' demographic and cultural characteristics and respective cultural profiles. Looking for an appropriate cultural model for this research, Hofstede’s cultural dimension model was chosen, which is the most used and well known when trying to understand cultural values. Hofstede’s cultural dimensions theory is a framework for cross-cultural communication. It describes the effects of a society’s culture on the values of its
members, and how these values relate to behavior, using a structure derived from factor analysis. The theory has been widely used in several fields as a paradigm for research, particularly in cross-cultural psychology and international management. Financial risk tolerance has been measured using several techniques. The techniques can be separated into measures based on observing risky behavior and measures using surveys to ask questions that gauge one’s willingness to assume risk in given situations (Hanna, Gutter, & Fan 2001; Hanna & Lindamood 2004). The interview is a necessary tool for understanding the many behavioural attributes that investors may exhibit. The development of a research instrument to measure investment risk tolerance and assess the effects of identified antecedents on the same will be used for data collection. The data collection will include descriptive statistics and correlations for the key variables, regression analysis both multiple and logistic, multivariable analysis, factor analysis and structural equations modeling and will be coded and analyzed by using statistical software programs.

**ORIGINALITY/VALUE/EXPECTED IMPLICATIONS**

Since published research in this research stream is rather limited, there is significant opportunity for this proposed research project to provide innovative, theoretical and practical knowledge for considerably enhancing current understanding on the subject and initiating an investigative stream for future research. The importance of the research relates to its focus on the culture characteristics which are largely overlooked by existing research. Focusing on the understanding of small investors’ attitudes towards financial risk will be beneficial for all parties concerned; academia, financial services firms and investors. It adds considerable value to academic knowledge on the fundamental discussion on small investors’ risk taking profiles. Small investors’ benefit of knowing their risk tolerance drivers will widen the array of their choices according to their needs and also it will also contribute a related framework to the existing literature. A number of possible future studies using the same experimental set up are apparent. Large randomized controlled trials could provide more definitive evidence. This research has thrown up many questions in need of further investigation. Various additional theoretical perspectives would also need attention on the basis of this research, in addition to widening the scope of the research.

THE INFLUENCE OF ENTREPRENEURSHIP ORIENTATION, MARKET ORIENTATION AND CORPORATE SOCIAL RESPONSIBILITY TOWARDS TAKAFUL AGENCY'S BUSINESS PERFORMANCE IN MALAYSIA

Nazri, Muhamad Azrin; Abd. Wahab, Kalsom; Omar, Nor Asiah

1Faculty of Business & Management, Asia Pacific University of Technology & Innovation
2Faculty Economics & Muamalat, University Sains Islam Malaysia

ABSTRACT

The formation of Islamic financial institutions and system including takaful is a “back-to-religion” signal in Muslim world that believe Shariah must be followed in a Muslim’s daily life. It is evidenced with more new Islamic bank and takaful licenses are issued to show Malaysian government’s strong commitment to promote the country as an international Islamic financial hub in the Asian region. Although the Takaful industry has seen double-digit growth for the past few years, but it is reported that the industry still suffers from a lack of penetration in the market, and still performs at lackluster levels and large potential takaful market still remain untapped to its fullest. Technically, Takaful is different from conventional insurance because from Takaful concept point of view a company is not the ‘insurer’ insuring the participants but the participant is actually mutually insuring one another. Conceptually, Takaful is an arrangement by a group of people with common interests to guarantee or protect each other from certain defined misfortunes. There have been calls for Takaful industry to apply entrepreneurial orientation (EO), marketing orientation (MO) and societal concept (CSR) to make the industry more competitive. This study is to assist the Takaful operators and Takaful agencies in the country to identify ways to improve their business performance based on the concept of EO, MO and CSR and ultimately grow the Takaful industry in the future. Purposive sampling will be adopted where Takaful agency will become the respondents whose criterion meets the purpose of the study. PLS – SEM will be used to analyse the data and finding will be presented.

THE IMPACT OF THE GREEN INVESTMENT ON INDUSTRY AND SOCIETY: 
NINE BENEFITS 

Negulescu, Oriana¹; Doval, Elena² 

¹Spiru Haret University, Faculty of Management Brasov, Transylvania University of Brasov, Doctoral School 
²Spiru Haret University, Faculty of Management Brasov 

ABSTRACT 

The green investment, as a concept, is quite new. Nevertheless, the concept captures the investment is made in a company or in the public area that has the scope to reduce the carbon effect on the environment and/or to avoid the environmental damage. However, after an introduction that summarizes different approaches of this concept, the paper is discussing how green investment is understood in Romania by the managers and the executives. Based on a question regarding the benefits of the green investments, as part of a larger survey conducted in 2013, this study is aiming to emphasize the impact of the green investments on different industries and on people in Romania. The organizations questioned are belonging to ten industries and the survey has covered half of the Romania’s counties, getting a representative sample, although, the research has used a qualitative approach. The benefits of the green investments that have been emphasized in this research are: new markets; new jobs; economic stability; high return on investments; ethics in business; social responsibility and cooperation. In addition, two other benefits specifically to the people are underlined. The green investments are usually pushed on by six main drivers: renewable resources; clean energy, wastes management; IT; innovation and environment regulations. Furthermore, considering the above mentioned drivers of the green investments and the benefits, the paper is providing a conceptual model to provoke the organizations for consequently implementing the green investments, in order to reach out the benefits for the entire society, after all. 

METHODOLOGY, FINDINGS AND DISCUSSION 

The methodology used in this study is a research based on a survey and in addition, the observation, the analysis and personal judgment. The question about the green investments’ effects is part of a larger survey which has been conducted in 2013 on a representative sample of 400 companies located on 21 counties, out of which 374 answers were valid (5.17% error). The entire population considered is composed by around 500,000 companies. The interesting fact is that only 186 (49.73%) of the organizations are interested in the green investments, called here the sub-sample 1, and the other 50.27% are not investing in greening the organization, called here the sub-sample 2. In the entire sample, only 119 persons are in charge with the environment activities. The organizations questioned
are belonging to the following 10 industries: agriculture (including farms, forests and fisheries); constructions; transportation; research; processing industry; energy; commerce; tourism; banks and insurance; and other services. The variables are: new markets; new jobs; economic stability; high return on investments; ethics in business; social responsibility and cooperation. However, the data analysis (the total data and the structure by industry) refers to the sub-sample 1. Therefore, the total frequency and the frequencies by the industry for the seventh variables mentioned above are presented and discussed. The answers have been provided by the organizations’ managers (69.4%) and the executives (30.6%), out of which 91.9% were males and 8.1% females. In brief, the main findings emphasize that the new markets (including new beneficiaries, clients and consumers) are representing 38.2% of the benefits, followed by the economic stability and high return on the investment (17.2% each), better ethics in business (10.8%), new jobs creation (8.1%), social responsibility (6.5%) and finally, the cooperation between the organizations and the organizations and the public sector (1.6%). The main descriptives have been calculated: the mean, the standard deviation, the variance, the kurtosis and the skewness. Furthermore, the Kolmogorov-Smirnov test for nonparametric variables has been applied. The distribution of the variables is Normal with the parameters: the mean (location=2.6183) and the standard deviation (scale=1.70832). The analysis by industry is highlighting the top 5 industries that are considering the green investment and its benefits in their strategy, i.e. the processing industry, followed by commerce, transportation, other services and constructions. A model of the green investments benefits is designed as being determined by several drivers, as the followings: the renewable resources; the clean energy; the wastes management; the use of IT; the innovation, as well as the environment regulations. Nevertheless, the impact of the green investments on the industry and on the people is summarized in the conceptual model proposed, considering other two benefits, apart of the survey. The society is the main beneficiary of the greening the industry by investments. A healthy and safety life and social wellbeing, could not be assure in a polluted environment and a dramatically climate changing, but in a green environment.

CONCLUSIONS

About 50% of the Romanian organizations are interested in the green investments. Most of the organizations are considering that the main benefit of the green investment is the new markets (including new beneficiaries, consumers and clients), as the society tends to purchase green products and services. Even if the green investments are making new jobs and the benefit for the society is to be huge, only 8% of the organizations are considering this aspect as a benefit. The conceptual model proposed in the paper has a practical scope, i.e. to give a signal to all managers to invest green. This model ought to be adapted to the specific industry.

THE IMPACT OF RELATIONAL DYNAMICS TOWARDS MALAYSIA’S HIGHER EDUCATION OFFERINGS IN CHINA

Omar, Nor Asiah1; Nazri, Muhamad Azrin2; Kasim, Mohd Yusof3

1School of management, Faculty of Economics and Management, University Kebangsaan Malaysia, Malaysia
2Faculty of Business Management, Asia Pacific of Technology and Innovation (APU), Malaysia
3College University of Insaniah, Malaysia

ABSTRACT

The intense competition in the global higher education sector calls for higher learning institutions to design winning strategies for attracting foreign students. As Malaysia positions itself as a regional education hub and strives to consummate this status, the nation’s higher education institutions must be equipped with knowledge on how to attract quality foreign students. China is an important market for MHEIs, and students from China make up the largest single country group of students in Malaysia. For this trend to continue, MHEIs must continue to enhancing students’ experiences through value in education and relationship with students and placement institutions/organizations they partner with to secure these students. Drawing on several theories (e.g. social exchange and relationship marketing theories), this study aims to examine the impact of relational dynamics (trust, competence, commitment, communication and pre-emptive conflict handling) on relational response and return (satisfaction, loyalty and return on relationship). Using a survey approach, 321 questionnaires were collected from Chinese’s students in China, who are contemplating studying overseas. Findings show that commitment and communication are positively related to satisfaction and loyalty, while commitment, satisfaction and loyalty are positively related to return on relationship. Long term orientation (LTO) was found to moderate the relationship between relational dynamics and return on relationship. Overall, the study makes important theoretical and managerial contributions to the literature and higher learning institutions.

INTRODUCTION

Ministry of Higher Education (MoHE) Malaysia target to enroll 200,000 of international student to Malaysia institution by 2020. Increasing in the number of enrolling international students in Malaysia contribute to RM600 billion to Malaysia’s economy (Chi, 2011). Due to the encouragement of fierce entering of international students to pursue their education in Malaysia institution, there is necessary for the nation’s higher education institutions to equip with marketing knowledge or strategic to attract quality international student by focusing and understand on their need. Sheth et al. (1991) identified few factors that in the research for international student decision to study in Malaysia institution
among them are epistemic, functional and emotional consumption values or a combination of these values. China is one of the biggest markets for Malaysia Higher Education Institutions (MHEIs) in internationalization of Malaysia higher education (MoHE, 2011). The critical issues faced by Malaysia higher education marketing with regard to China’s student is attracting quality foreign students, providing quality education to student and increasing student’s satisfaction together with loyalty (Arokiasamy, 2011). There are numerous studies investigate the relational dynamics practice in the relationship marketing (Sohail, 2012); nonetheless, research noted that cultural could influence the efficiency of relationship marketing and one of it was long term orientation (LTO) (Ryu et al., 2007). LTO involves in Confucian dynamism where include hard work, face-saving in relationship, future-planning and values’ perseverance, exists between among Chinese due to their life style practice and heritage (Wang et al., 2008). This may create moderation effect to the RM strategy and incurred long duration. Using social exchange and relationship marketing theories, this study was designed with the purpose of uncovering the relationship between relational dynamics (trust, competence, commitment, communication and pre-emptive conflict handling) and relational response/return behaviours (satisfaction, loyalty and return on relationship) of relationship marketing in the education sector. Furthermore, this study sought to examine how long term orientation (Confucian dynamism) interacts with relational dynamic in influencing relationship return behaviours.

METHODOLOGY
Using a convenience sampling survey, 400 questionnaires had been distributed to the students from the list of MHEIs sourcing students from China were derived from MOHE and Immigration services, which involve the student visa section. 321 responses were used for analysis into SPSS to examine the hypothesized relationships.

FINDINGS AND CONTRIBUTIONS
The study found direct effects of commitment and communication on satisfaction and loyalty and direct effect of commitment, satisfaction and loyalty on return on relationship among international student in Malaysia. An important novel finding is the influence of long term orientation as moderating factor between the relationship of relational dynamics and return on relationship. This study expands the application of the relational dynamics and return on relationship in the context of international students from China by including long term orientation as moderating variables. The findings beneficial for local Malaysia higher education either public higher education or private higher education in recruiting more quality students from foreign country. Handling international students’ psychological and cross cultural adjustment during the period of pursuing
their studies in Malaysia, can furthering to tighten up the Malaysia with international student business relationship.

AUDIT QUALITY AND GOING-CONCERN OPINION: EMPIRICAL STUDIES
DURING THE FINANCIAL CRISIS
Pagani, Alessandra; Gaetano, Alessandro
Department of Business Government Philosophy Studies, University of Roma Tor Vergata, Roma, Italy

ABSTRACT

PURPOSE AND THEORETICAL FRAMEWORK
The global financial crisis has increased the attention of regulators, standard setters, and investors to the auditor’s assessment of and reporting on a company’s ability to continue as a going-concern (Carson et al., 2013). The empirical issue examined in this paper is the relation between the audit quality and the probability that a financially distressed company would receive a going-concern opinion. According to the previous literature, we adopt the DeAngelo’s (1981) two-dimensional definition of audit quality as the probability that an auditor will both discover and report a breach in an accounting system. More in general, audit quality refers to the auditor’s capabilities to individuate misstatements and errors in the client’s financial documents, as well as the auditor’s independence to report those misstatements and errors. Furthermore, the auditor should provide a professional opinion about the reliability of the information contained in the financial statements. Because audit quality is not directly observable, previous studies have used different signals as a proxy of audit quality, such as accrual-based measures and the auditor’s propensity to issue a going-concern modified audit opinion. In this study, we adopt the auditor’s propensity to issue a going-concern modified audit opinion as a proxy of audit quality. In particular, the audit opinion may provide stakeholders with useful information that could reduce agency costs. However, it is difficult to associate different types of audit opinion with different levels of audit quality, because every audit’s client has a unique history. Several authors presume that a lower grade of audit quality is represented by an increase in the likelihood that an auditor issues a going-concern opinion when a company subsequently goes bankrupt (e.g. Knechel and Vanstraelen, 2007). Previous studies have considered different proxies to investigate the economic trade-offs facing the auditor during the decision-making process regarding the issuance of a going-concern opinion. Krishnan and Krishnan (1996) demonstrated that the audit opinion decision is influenced by the client size and the auditor litigation risk. DeFond et al. (2002) indicate that loss of reputation and litigation costs compromise the auditor’s independence. Vanstraelen (2002) reaches the same conclusions relating to the levels of audit fees and the loss of audit clients in the Belgian context. In Spain, Ruiz-Barbadillo et al. (2004) demonstrate that both the entity’s financial problems and the
The auditor’s level of independence affect the probability that a financially distressed entity would receive a going-concern opinion. In Italy (the context of the present research), the Civil Code requires the ability of an entity to continue as a going concern (art. 2423-bis c.c.) that it is defined as the going-concern assumption1. The going-concern assumption is a fundamental principle in the preparation of financial statements. Consequently, the problem of verifying the existence of the assumption of going concern is relevant for the auditors’ activities. In this regard, the ISA No. 570 provides guidelines about the auditor’s verification for the correctness of the going-concern assumption used as a basis for the preparation of financial statements. This going-concern verification is fundamental for the auditor’s opinion. In particular, the auditor’s responsibilities are to obtain appropriate audit evidence regarding the appropriateness of management’s use of the going-concern assumption in the preparation of the financial statement and to conclude whether material uncertainty exists in terms of the entity’s ability to continue as a going concern (Provasi and Riva, 2014).

METHODOLOGY

In this research, we analyze 305 listed entities to investigate the relation between audit quality and the probability for a financially distressed company to receive a going-concern opinion between 2007 and 2011 in Italy. We chose the Italian context to fill the gap in worldwide studies of this issue. The period selected reveals the effects of financial crisis. Following Ruiz-Barbadillo et al. (2004), this study investigates the auditor’s decision-making process in the presence of going-concern uncertainties. The going-concern decision is divided into two phases. The first phase concerns the identification of an entity with a potential going-concern problem. The second phase concerns the determination of whether a company with a going-concern problem should receive a going-concern opinion. Consequently, the auditor’s decision-making process will depend on the auditor’s competence in the first phase and on the auditor’s independence in the second phase (DeAngelo, 1981). According to the literature (Vanstraelen, 2002, Geiger and Raghunandan, 2002, Ruiz-Barbadillo et al., 2004, Geiger et al., 2014), we identify an entity as financially stressed if it exhibits one or more of the following features in the financial statements under audit: 1) negative working capital, 2) negative retained earnings or 3) bottom-line loss. In addition, consistent with Reynolds and Francis (2001) and Ruiz-Barbadillo et al. (2004), we have examined the subsequent fiscal year financial statement in order to identify the existence of relevant sales of assets or the issuance of new debt or equity, because such mitigating

1 In Italy, the going-concern assumptions are contained in: 1) Civil Code, Article 2423-bis; 2) No OIC. 5 - Financial Statements for company in liquidation; 3) No OIC. 11 - Financial Statements, objectives and postulates; 3) IAS 1 - Presentation of Financial Statements; 4) Auditing Standard no. 570 - Going Concern; 5) The Bank of Italy / Consob / Isvap. 2 of 6 February 2009; and 6) Consob Communication no. 9012559 (6 February 2009).
factors could influence the auditor’s decision-making process. Entities that have one or both mitigating factors are excluded from the sample. In our research, we identify 305 potentially financially distressed entities. Of this sample, 28 entities received a going-concern opinion.

In order to investigate the relation between audit quality and the auditor’s opinion for financial distressed entities, we use the following logistic regression model:

\[ \text{GOING-CONCERN} = F(\text{CLIENTSIZE}, \text{AUDITORSIZE}, \text{RECEIVABLE}, \text{INVENTORY}) \]

CLIENTSIZE is a proxy of the expected cost of possible client loss if the auditor issues a qualified opinion. It is represented by the ratio of clients’ assets to total clients’ assets of the auditor. AUDITORSIZE is a proxy used to capture the reputation effect. It is measured by the ratio of sales audited by each auditor to sales audited in the entire audit market. RECEIVABLE and INVENTORY are proxies for potential losses from litigation. RECEIVABLE is calculated as receivables to total assets, and INVENTORY is the ratio of inventories to total assets.

**FINDINGS AND IMPLICATIONS**

Table 1 describes the univariate analysis of the explanatory variables classified according to the existence of going-concern opinion (GC) or lack thereof (NO GC).

<td>0.079</td>
<td>0.110</td>
</tr>
</tbody>
</table>

Table 2. *Univariate analysis of the proxies*

The findings show that there are relevant differences between financially distressed entities that received a going-concern opinion and those that did not. In more detail, the variables CLIENTSIZE and AUDITORSIZE, which describe the economic trade-off related to the expected cost of possible client loss and reputation costs, underline a clear difference between the two groups. Regarding the variables RECEIVABLE and INVENTORY, which measure the litigation risk, the findings show that the entities with going-concern opinions have slightly higher value than those without going-concern opinions.

Providing an in-depth analysis on the relation between audit quality and the issuance of a going-concern opinion during the financial crisis, our research should be useful to regulators, practitioners, academics and standard setters, as they evaluate auditor performance in the Italian context.

THE IMPACT OF THE ECONOMIC CRISIS ON HIGHER EDUCATION IN CYPRUS: MARKETING SERVICES TO SATISFY INTERNAL CUSTOMERS AT THE UNIVERSITY OF NICOSSA

Papasolomou, Ioanna; Iacovidou, Melpo; Thrassou, Alkis

School of Business, University of Nicosia, Cyprus

ABSTRACT

The paper investigates the decisions and actions implemented within the University of Nicosia, a private tuition-paying university, following effects of the economic crisis in its effort to view and treat students as “internal customers”. It examines the university’s efforts to instill a more “student centered” culture aimed at addressing and satisfying the needs of its students as these are especially shaped by the current economic crisis by using primary data provided by the student support office of the university. Although universities were somewhat lucky, in being granted partial exemption from the “haircut”, they still lost millions of euros, on their deposits, out of which running expenses as well as salaries of faculty and staff is paid. The university has to cope with the loss on its deposits, liquidity problems and an expected decrease in future revenues and cash collections. The management of the university studied has recognized the need for instilling a strong “customer orientation” in its internal market focusing on students’ so as to increase student retention and maintain the graduation rates. A number of initiatives and activities have been launched within the university under the umbrella of student/customer orientation.

ABSTRACT

The aim of this paper is to discuss the theoretical underpinnings and managerial implications of a research study that was carried out in one of the biggest Health and Fitness Centers in Cyprus, the Sana Hiltonia Health and Fitness Center situated in Nicosia. The study’s primary aim was to shed light onto the underlying ideas and practice of Internal Marketing (IM) within the specific organization as well as explore the rationale for its adoption and practice through the perceptions, attitudes and experiences of the company’s management, employees and external customers.

Berry et al. (1976) first introduced the IM term as a solution to the problem of consistently delivering high service quality. According to Ahmed and Rafiq (2004) over the next thirty years or so the concept of IM has gone through various phases of development and evolution founded on three notions namely: employee motivation and satisfaction (Berry 1981), customer orientation (Gronroos 1981), as well as strategy implementation and change management (Winter 1985). Despite its popularity and growing literature IM failed to be widely adopted by organizations. This is largely due to the lack of a single unified definition of what IM is. The term ‘IM’ was firstly defined in Berry’s (1981) article according to which: “IM is about viewing employees as internal customers, viewing jobs as internal products that satisfy the needs and wants of these internal customers while addressing the objectives of the organization.” IM is the philosophy of treating employees as customers and it is the strategy of shaping job-products to fit human needs.” Gronroos (1985, p. 42) extended the notion of IM to a method of motivating personnel towards customer-consciousness and sales mindedness to include the use of marketing-like activities in this pursue: “…holding that an organisation’s internal market of employees can be influenced most effectively and hence motivated to customer-consciousness, market orientation and sales-mindedness by a marketing-like internal approach and by applying marketing-like activities internally.” Eventually, IM began to be recognized as a method for managing employees towards the achievement of organizational goals.

The Cyprus business sector depends predominately on the production of services ranging for example from banking, hospitality and tourism, higher education, auditing, legal services, health and fitness. The Sana Hiltonia Health and Fitness Centre embarked on an attempt to implement IM in an effort to gain a competitive advantage by strengthening service quality and customer satisfaction. The researchers employed a single-case study approach that concentrated on one single service.
organization. The organization studied has a strong corporate reputation and a large strong market share in the specific industry. The case study research approach was adopted in order to help understand the practice of IM through exploring the perceptions and experiences of the manager and employees working in various positions within the organization. Since the head office had adopted IM in order to improve service quality and customer satisfaction there was a need to explore the IM perceptions and experiences of both internal and external customers. Primary data was collected through the use of personal face-to-face interviews with the Sana Hiltonia manager and eleven employees. For this reason the study was primarily qualitative in nature integrating both qualitative and quantitative data. There was also a need to explore the perception of external customers in relation to the quality of service and customer focus. A total of 220 questionnaires were distributed to external customers in order to investigate the impact of IM on service quality and customer satisfaction. From these, 150 were completed and returned.

The study reveals that although the centre’s manager perceives IM as a strategic process that aligns, motivates and empowers the company’s employees towards the achievement of organizational goals the company has failed to adopt and implement a strategically formal IM approach. The tools used to implement the IM ideas are not strategically integrated. There is a lack of effective coordination and management of the IM initiative which demonstrates that in the organization studied IM is simply an ad hoc tactic that encompasses various activities some of which are formally planned and assessed. These are the non-monetary rewards and personal development programs. This approach results in confusion and inconsistencies in the way IM is understood and practiced by the employees and hence jeopardizing its effective implementation.

The study revealed that there is a strong recognition of the importance of employees by both the centre’s manager and external customers. Happy and motivated employees are seen as a prerequisite for achieving superior service quality and customer orientation. The employees are also perceived as the organisation’s source of gaining competitive advantage and achieving differentiation in a sector which is characterized by intense competition and homogeneity.

The findings that emerged from analyzing the data received from the centre’s external customers revealed that the external customers feel that the employees’ commitment and dedication towards achieving service excellence has the potential to transcend internal and external service encounters and create a culture that nourishes service excellence and leads to customer retention and loyalty. However, the management has not yet found a way to design, develop, implement and manage the IM effectively and hence, has not yet achieved the goals that motivated the organization to adopt IM in the first place.

ABSTRACT

This paper responds to the lack of research in the area of Internal Marketing (IM) and its practice within the business sector by investigating the perceptions held by senior level managers regarding the IM underlying ideas and implementation within the International Business Centre (IBC) of a leading bank in Cyprus (Bank A), whose name cannot be revealed for confidentiality reasons. At the time the study was contacted, the bank’s IBC was the leader in the Cyprus banking industry in terms of the number of customers, customer service and information technology. The study sought to identify the rationale behind the adoption and implementation of IM and the extent to which the specific IM implementation strategy was successful.

There is a lack of knowledge and understanding in the existent IM literature in relation to whether the IM concept is practised within the business sector and the way in which it is practised. Internal Marketing refers to the application of marketing management knowledge which was originally developed for external marketing – on the ‘internal market’, that is the employees. At the heart of the concept is the idea of viewing and treating employees as ‘internal customers’. The concept has the potential to get employees in tune with existing conditions and procedures as well as with changes.

There is evidence to suggest that internal marketing is any form of marketing within an organisation which focuses staff attention on the internal activities that need to be changed in order to enhance external market place performance. By treating employees as customers, the employees’ attitudes will change, employees will become more motivated and service minded which has the potential to lead to better service quality and a competitive advantage in the market place.

The study adopted the case study research methodology to investigate the extent to which a formal internal marketing strategy was been implemented, managed and monitored throughout the three regional International Business Centres (IBCs) of the bank studied. The researchers used triangulation by retrieving primary data through observation and personal face-to-face interviews with employees and managers working at different levels within the bank’s regional IBCs.

The focus of the study was an in-depth investigation and cross-examination of the perceptions, feelings, attitudes and experiences with IM provided by different organisational members working at different managerial levels to establish whether there was a perceptual gap and inconsistencies in the
way IM was conceptualised and practiced. The researchers interviewed: the director of the IBB, five regional IBCs managers, eight middle managers, and eleven lower level employees.

The study revealed that the managers’ interviewed had no clear view of the IM concept and even though they recognised some of the key IM ideas it was clear that the bank had not adopted an IM approach, one which was formally and strategically implemented across divisions. The managers interviewed related IM with external customer service and external customer satisfaction failing to recognise the importance of achieving employee satisfaction as a prerequisite for external customer satisfaction. A number of discrepancies emerged revealing that the current IM approach appears to be a “facade” hiding away an aggressive approach to ‘sell’ the bank’s corporate brand and organizational goals and strategies (such as customer focus and orientation) to its employees. It was clear that the specific organization had adopted IM as a way to manipulate its workforce towards the achievement of organizational strategies by pretending that it cares for the welfare of its employees. The lower level employees claimed that the bank did not implement IM which highlights that the current implementation approach is ineffective. The majority of the lower level employees consider that IM is implemented in order to “show off” and pretend that the bank has a caring face towards its employees.

The rationale behind the adoption of IM within the IBCs was primarily as a change mechanism and the minimization of the employees’ resistance to change. The bank had embarked on a series of internal changes and IM was seen as a strategy for overcoming the employees’ resistance, fear and scepticism towards change. The study also revealed that IM was adopted in order to demonstrate that the bank (management) cares for its employees as a way to motivate them to work harder towards the achievement of organizational goals such as the achievement of customer satisfaction and sales mindedness.

The study revealed that the IM implementation approach was considered to be successful by the branch managers. However the perception held by the lower level employees and by the majority of the middle-level managers was that the IM practice was unsuccessful. This finding demonstrates that there is a perceptual gap between senior and lower level employees. This gap can lead to conflicts and frictions not only within the units/branches themselves but between different departments.

The study’s findings have implications not only for other organisations in the banking sector but also for the wider services sector in Cyprus and Europe. Employees are the backbone of the organisation. They are ‘breathing’ and ‘living’ the values of the organisation. They experience the company’s organisational culture on a daily basis. They are also interacting with other organisational members. The way they are viewed and treated has a direct impact on their attitudes and behaviour towards the external customers. Any initiative or strategy adopted at a headquarter level must be carefully
implemented and monitored throughout the organisational units/departments in order to ensure its successful implementation. Failure to do so can result in employee dissatisfaction, frustration, and the whole process can be counter-productive. Although the bank studied ‘embraced’ internal marketing at a headquarter level as a change mechanism it failed to effectively monitor its implementation resulting in confusion, dissatisfaction and internal conflicts.

THE QUEST FOR NON-TECHNOLOGICAL INNOVATION IN CREATIVE INDUSTRIES

Parga-Dans, Eva¹; Martín-Ríos, Carlos²

¹Facultad de Ciencias Humanas y de la Educación. Universidad Técnica de Ambato, Ambato, Ecuador
²Maine Business School, University of Maine, Orono, Maine, USA

ABSTRACT

Non-technological innovation is an essential asset for firms in the creative industries to survive and succeed in an increasingly competitive market. However, research on disruptive non-technological innovation is insufficiently documented, leading to questions about the role and relationship between the main non-technological innovations: business model innovation (BMI) and management innovation (MI). Greater understanding of the advantages of each innovation positioning and their significance for innovation performance is critical for cultural industries where unpredictability and the accelerating pace of change pervade the innovation decisions. Drawing on four exemplary cases of archaeological firms in Spain, this paper explores the innovation process dynamics found in such cases. The study argues that, in order to cope with the changing dynamics of their activity, creative firms need disruptive business model innovation and, at the same time, a portfolio of complementary organizational innovation initiatives.

Innovation is essential for entrepreneurial firms in creative industries where a complex institutional environment and limited management resources, exacerbated by the reliance on highly skilled human capital, drives increasing commercial competition within the industry. The international financial crisis between 2007-2008 and further economic downturn, has intensified their search for innovative solutions to shrinking business opportunities. Recent studies on innovation in creative industries have shown certain peculiarities, particularly their reliance on non-technological sources of innovation (Franklin et al., 2013). In the event of convoluted economic conditions, the pioneer firm attempts innovative business model solutions (Foss and Stieglitz, 2014). That source of innovation tends to be disruptive and, in creative business, first-mover status is a precarious position on which to rest business practices and model. This is the situation confronting most entrepreneurial firms in creative industries when determining whether to pursue a disruptive innovation (McKelvie and Wiklund, 2008).

In his work on disruptive innovation, Christensen (1997) asserts that, for pioneering firms, disruptive business model solutions may provide a competitive advantage in the fast-paced competitive challenges of dynamic sectors. However, as we contend in this work, the success of business model innovations might require further innovation solutions in the form of new management practices (Mol and Birkinshaw, 2009; Preston et al., 2009). First movers might be disadvantaged by their lack of
experience to foresee, giving a chance to second movers, who may have a more systematic, strategic approach toward innovation. This does not imply that some first movers often have a clear advantage over followers, but as Schnaars (1994) recognizes, innovation studies need to acknowledge the huge amount of uncertainty that innovative activity brings in. This is even more critical in a changing economic landscape, where firms are forced to constantly reposition their strategy and offer new services.

The study of organizational innovativeness in creative industries requires systematic research into the dynamics associated with the determinants of innovation adoption. The newness of certain innovations may be detrimental to early adopters. Alternatively, for first-movers and early-movers of non-technological innovations, business model innovations allow for faster-growing, profitable innovation success. This is a remarkable quest for small firms that the literature has not addressed yet. Specifically, to what extent does the level of non-technological innovation disruption contribute to innovation success?

To address this research question, this study explores the success path taken by firms in the creative industries in terms of introducing disruptive business model innovations. We do so by drawing on commercial archaeological service in Spain and by qualitatively analyzing four such firms. Commercial archaeology represents a relatively modern business activity, which took off as a result of favorable legal requirements on heritage protection and an endless service demand from the construction activity occurred during this period had an extraordinary development at the beginning of the 21st century. This context strengthened the creation of numerous archaeological firms. However, the economic and financial downturn that began in mid-2007 severely affected this business activity, 42% of archaeological firms wiped out in four years and survivor companies were forced to innovate in order to adapt to the changing environment.

Our study of four exemplary cases traces the innovation pathways taken by these firms. We observed that to cope with failure and an unstable market environment, these four archaeological firms were prone to adopt new business models in order to redefine their activities and to explore new market venues. During the first few years of economic slowdown archaeological firms brought to life new business models, even if assuming high risk with little guarantee of success. Once pioneers introduced new business models as a way to stay abreast of slumbering market opportunities and large competition among competing firms, other archaeological firms attempted first-movers' innovations. However, our findings show these next-to-first movers not only adopted new business models but they also attempted systematic management innovation initiatives. That was deemed by interviewees at these firms as way to secure successful implementation of innovations in the business structure and to maintain these innovations over an extended period. In conclusion, our preliminary results show that
disruptive non-technological innovation strategies help entrepreneurial firms in creative industries to cope with changes in the activity.

CULTURAL HERITAGE VALORIZATION PROCESSES AS ENABLERS OF SUSTAINABLE TOURISM IN ECUADOR

Parga-Dans, Eva

Facultad de Ciencias Humanas y de la Educación. Universidad Técnica de Ambato, Ambato, Ecuador

ABSTRACT

Cultural heritage protection, management and valorization are essential tools for sustainability and valuation in Latin America countries. An interesting case is the National Plan for Good Living (2013-2017) advanced by the Ecuadorian government. This paper presents a work-in-progress research on the identification and characterization of Ecuadorian cultural heritage valorization model as it relates to cultural tourism planning and development, entrepreneurship and empowerment of indigenous communities. Research on tourism, entrepreneurship and local communities is considered essential in the formulation of a national policy and strategy. Ecuador exemplifies an ideal research context due to its strategic resources—natural and cultural diversity, and its economic and social characteristics and quandaries. Empirical evidence of different heritage valorization processes is presented through four case studies that exemplify integrative programs of cultural heritage protection, management and valorization.

Cultural heritage protection and valorization is a cornerstone of the current Ecuadorian political model as is reflected in the National Plan for Good Living (2013-2017). This paper presents work-in-progress research on the identification and characterization of the Ecuadorian cultural heritage valorization model in relation to cultural tourism development, local entrepreneurship and empowerment of indigenous communities. This topic is considered critical in the formulation of a national policy and local strategies. Ecuador illustrates an excellent research context due to its strategic natural and cultural resources, its economic and social characteristics and dilemmas.

The overcoming accumulation model based on extractive industries has become a topical debate on the various methods of development in Ecuador. Historically, Ecuador has been characterized by a succession of ups and downs in exports of the country’s main products: cocoa, banana, oil, flowers and fruit. This analysis indicates that economic growth in Ecuador has been characterized by an extractive model, based on the consumption and export of natural resources (Villalba, 2013). The Good Living approach opens new perspectives and offers an alternative paradigm to the previous development model. From this point of view, discussions of the Good Living and its application in government policy are particularly relevant. Specifically, the relationship between socioeconomic uses of cultural heritage and tourism development offers an interesting area of research (Iorgulescu et al., 2011; Poria and Ashworth, 2009; Aas et al., 2005).
Tourism is a relatively new economic activity in Ecuador and has grown exponentially in a short period of time, being the third most important economic activity in the country, after oil extraction and production of banana, attracting about 700,000 visitors per year (Ruiz-Ballesteros, 2011). Cultural tourism and its impact on local communities is a hot topic in academics and is currently being explored in the Ecuadorian context (Ballesteros and Carrion, 2007; Estrella Duran, 2007; Korovkin, 2001; Gould, 1999). It is therefore a priority to theorize about the uses of heritage valorization models in relation to sustainable tourism development.

The recent empowerment of communities in Ecuador coincides with the rise of indigenous movements and their political role since the final decades of the twentieth century (Estrella Duran, 2007). The indigenous communities are integrated into the political and administrative organization of the state (Organization and Management Act of Municipalities 2004) and the Constitution of 2008 recognizes indigenous rights. These communities are often in charge of guarding the community property (land) and have their own decision-making system. In this context, rural and indigenous communities have begun to consider participating in tourism activities, sometimes through community tourism formulas and developing entrepreneurship initiatives. Currently, about 60 rural and indigenous communities offer community tourism activities in Ecuador. It is estimated that these activities benefit some 15,000 people directly and indirectly (Ruiz-Ballesteros, 2011). Community tourism becomes a vehicle to meet the needs of indigenous communities and a way to achieve self-management of their lands and resources (Gould, 1999).

In this sense, to what extent has Ecuador developed heritage valorization processes under sustainable parameters with the environment and local communities?

This research is characterized by its exploratory nature. Empirical evidence is presented through four in-depth case studies: Baños, Cuenca, Galapagos and Ishkay Yaku as representative locations of the Ecuadorian natural and cultural diversity (mountains, city, coast and Amazon). Through these illustrative cases, the relationship between cultural heritage valorization and tourist impact is explored by means of a variety of data sources, using semi structured interviews, focus groups and participant observation.

This multimethod field study indicates that cultural heritage valorization processes can serve as an important enabler of tourism activities. It also shows that tourism planning, political involvement and community participation may facilitate productive capabilities, local entrepreneurship and the empowerment of communities involved by providing sustainable tourist activities.

FASHION AND FACE CONSCIOUSNESS – EVIDENCE FROM A CROSS-CULTURAL STUDY

Pfajfar, Gregor1; Shoham, Aviv2; Anil, Nihat3; Pesämaa, Ossi4; Makovec Brenčič, Maja1

ABSTRACT

Fashion and brand preferred consumption always attracted special attention of academic researchers (e.g. Liao & Wang, 2009; Pentecost & Andrews, 2010; Pookulangara & Shephard, 2013), some even claiming brand consciousness to be the most influential factor on consumption (Zhang & Kim, 2013). Although its definition may be universal (the extent of an individual’s interest in and attention to the latest fashion trends, having a style up to date with what’s new on the market; Manrai et al., 2001), there are reported market differences in fashion consciousness between developed and less developed countries (Parker, Hermans & Schaefer, 2004). For example, consumers in Eastern Europe have always been interested in Western style, thus their exposure to Western brands and advertising affected consumer values to change from former collectivist to individualistic values (Manrai et al., 2001). The key to explain these cultural differences in behavioral sciences holds in culture-specific values, mianzi or face in particular (Zhang, Doom & Leeflang, 2014).

People in Eastern societies are under constant pressure to live up to expectations of others in order to “save face” (Parker, Hermans & Schaefer, 2004). As “face” refers to “a sense of favourable social self-worth that a person wants to maintain in relational and network contexts” (Zhang, Doom & Leeflang, 2014), people with high face consciousness will care more about their self-image and others’ appraisal (Liao & Wang, 2009). Thus, collectivistic Eastern consumers with a greater face consciousness (desire to enhance, maintain and avoid losing face in relation to others in social activities) may place more emphasis on publicly visible possession than Western consumers do (Bao, Zhou & Su, 2003). In fact, novelty and fashion conscious consumers are not just motivated by a concern for the avoidance of losing face (Parker, Hermans & Schaefer, 2004), but are actually gaining face from being trendy (Bao, Zhou & Su, 2003; Liao & Wang, 2009). On one hand, Eastern consumers use luxury fashion goods not just to show their status or boost their self-recognition, but are also an essential symbol of group identity, determining wearer’s social position and esteem (Zhang & Kim, 2013). On the other hand, Westerners’ fashion consciousness is driven by their need for uniqueness (Bian & Forsythe, 2012; Ko & Megahee, 2012) and authentic life, expressing their inner values and tastes through affinity for highly personalized products (Parker, Hermans & Schaefer, 2004). Here, we observe the rise of material values...
in Western societies and face consciousness in the Eastern societies. Materialism and face were found to influence brand consciousness differently, as they are basically two different constructs. Materialism being rooted in the modern economic lifestyle is based on individualistic cultures focusing on hedonic meanings mainly related to consumer behavior; while face existed since ancient times in collectivist cultures representing a social concept of the self, addressing interpersonal significance and being related to almost all respects of life (Liao & Wang, 2009). In sum, the concepts of face and fashion consciousness have a different meaning across cultures and may consequently differently impact consumer behavior.

A call for a good measurement instrument for the face consciousness concept (Bao, Zhou & Su, 2003), led us to expand the set of proposed cultural dimensions elaborated in the previous literature to independence, power and social inequality as cultural-specific antecedents (these were selected as they are social norms highly rooted in the culture) to face consciousness. We believe that fashion is a good proxy of culture. Thus, our goal is to propose a new model, evaluating the interconnectivity between face consciousness, interpersonal influence, fashion consciousness and brand consciousness. We claim that fashion explains the way we act, behave and communicate. Furthermore, fashion is determined by our cultural orientations and is strengthened by how we communicate through others and our brands.

In sum, the idea of this paper is to enhance the understanding of consumer decision behavior with relation to face and fashion consciousness across cultural contexts.

This is a multi-country study. In total we received 650 number of responses and 525 observations were usable. The final data contain information from individuals as follows: 193 Slovenian, 177 Turkish and 155 Israel. Countries were selected in the sample based on several criteria: a) they belong to Eastern group of countries, b) are at different level of development, c) differ in national cultural values. Israel was selected as it is the most developed country in the Middle-East (Eurostat, 2014) and culturally most similar among Eastern countries to the West, particularly to USA (Hofstede, 2001). Turkey was selected as it is currently one of the fastest growing economies in the world, and at the same time at the crossroad between Europe and Asia, where Western values are mixed with Eastern values. Finally, Slovenia was selected as one of the typical representatives of Eastern Europe, being at the average development of European Union countries (Čater & Čater, 2011). Furthermore, sample has an average age of 44.64 years in Slovenia, 40.08 in Turkey and 35.68 in Israel. All samples are relatively equal across gender and biased towards married couples. A structured questionnaire with eight established scales and 25 items was used. Since these scales were developed in English, back-translation was used to ensure equivalence of items. The same approach was used in all three countries.

Structural equation modeling (SEM) was used to establish if a theoretical model fits the observed data. Confirmatory factor analysis (CFA) followed by a structural model is a popular approach and its
estimated $\chi^2$ and normed-$\chi^2$ test how well the model fits the data (Anderson and Gerbing, 1988). A country-stacked model with no cross-country constraints as an initial baseline model was used here (Bagozzi & Yi, 2012). These initial goodness-of-fit statistics were acceptable (CFI = .96, RMSEA = .028, SRMR =.052, and $\chi^2 = 1052.332$ [df = 741; $p \leq .000$, $\chi^2$/df=1.420]). When testing the baseline model, the data supported an eight-construct model in all three countries, indicating that they exhibit the same factor structure ($\chi^2 = 1052.332$ [df = 741; $p \leq .000$, $\chi^2$/df=1.420]; CFI = .96, RMSEA = .028 and SRMR =.052). Furthermore, independence and its expected positive relationship on face were not supported in any of the three countries. Face consciousness was proven to have a significant positive relationship on fashion consciousness to the highest extend in Turkey and on brand consciousness in Israel.

In sum, this study has provided a new conceptual model for testing fashion and face consciousness in cross-cultural context. In line with these goals, it provided also a first test of several scales’ reliability and validity. Second, finding that the role of face consciousness in fashion and brand preferred consumer purchases was mostly supported in three different countries (Slovenia, Israel and Turkey) strengthens the argument for the generalizability of the face-fashion consciousness model. Third, this paper tested an integrative model for face consciousness, which provided some support for the roles of several antecedents and consequences proposed by Bruner and Kumar (2007) as important topics for further research. Finally, this paper posits face and fashion consciousness under the loop of different cultural communication antecedents, offering important implications for cross-cultural research.

Keywords: face consciousness, fashion consciousness, brand consciousness, interpersonal influence, independence, power, social inequality, cross-cultural study.
LOOSE- OR TIGHT- COUPLING? EXPLORING THE INTERPLAY BETWEEN DECOUPLING, SLACK AND RESILIENCE IN PUBLIC ORGANIZATIONS

Pinheiro, Rómulo¹; Ramirez, Francisco²; Trondal, Jarle³

¹Dept. of Political Science and Management, University of Agder, Norway
²Graduate School of Education, Stanford University, USA

ABSTRACT

This paper contributes to this special track by critically exploring a major (taken for granted) assumption in today’s strategic debates on public organizations such as universities, i.e. the prevalent notion that, in today’s complex higher education environment, ‘fit for purpose’ is a function of the degree through which strategies, structures, activities and academic norms and values ought to be tightly coupled with one another, and the idea that this tight coupling is to enhance universities’ abilities to respond to an increasing complex set of external demands and expectations, including but not limited to their generative and/or developmental role at the national and regional levels. There is a burgeoning interest on the notion of resilience within the organizational science literature. Similarly, neo-institutional scholars have recently re-discovered the relatively unexplored domain of decoupling both within and across organizational boundaries, a topic going back to the seminal work of Karl Weick (Weick 1976). Further, management theorists have long argued for the criticality of organizational slack on firms’ performance, innovation, the sustainability of competitive advantages, etc. The paper explores the interplay between these three relatively distinct yet not necessarily dissociated organizational dimensions – decoupling, slack and resilience – within the context of an external, global interconnected environment characterized by volatility, financial austerity and increasing competitiveness on the one hand, and the gradual erosion on the levels of trust and legitimacy enjoyed by governments in general and publicly- run and funded organizations in particular.

Following Weick (1976) and others, we have chosen to focus on public educational institutions (i.e. universities) as the object of analysis. The rationale for this choice is twofold. First, universities, the world over, are facing increasing pressures to respond, more efficiently, to a wide range of societal demands and stakeholder groups; from governments to industry to local communities. Second, professionalization and managerialism have led to the rise of strategic science regimes in higher education, manifested in an attempt – by the steering core of universities (central and unit levels) – to more tightly couple internal structures and activities as a means of responding to the manifold challenges posed by drastic changes in their technical (operational) and institutional (regulative) environments. One of the ways in which universities have attempted to cope with these new set of
environmental demands lies on de-institutionalizing traditional structures and practices (e.g. collegial decision making) and, in turn, replacing them - re-institutionalization - with features associated with more entrepreneurial (i.e. ‘fit for survival’) models, characterized by a tighter internal coupling amongst strategic aims, internal structures, primary activities and behavioral postures.

Following the notion, and solid empirical evidence that requisite variety which suggests that the internal diversity of an organization (in terms of its information, operations, and mental models) should match the external variety of the environment for effective adaptation (Gray 2000; Popadiuk and Choo 2006), our main argument in this paper is that ongoing efforts to enhance tight-coupling across university structures, functions and activities have the potential for reducing (rather than enhancing) adaptive capacity at the organizational level. This is due to the fact that decoupling (e.g. different academic groups with similar interests doing different things) has the potential to generate organizational slack – defined here as internal repositories of knowledge, solutions, technologies, and world views - which, when/if “managed” in a proper manner, can become a valid strategic asset for universities whilst coping with drastic environmental change and/or while facing serious performance and/or legitimacy- related crisis (Geiger and Makri 2006; Huang and Chen 2010). Moreover, in this paper we contend (and empirically demonstrate) that the levels of organizational slack within a given university are directly associated with the degree of resilience to external events and stakeholders’ demands, e.g. increasing calls for a more direct contribution of university groups and primary activities to local, regional and national socio-economic needs and circumstances.

The paper is organized as follows. After presenting the three theoretical constructs and the relationships between them, we review the literature on organizational change and adaptation in higher education, providing evidence of a general move towards a tighter coupling of strategies, structures, activities, and behavioral postures. We then move on to suggest an integrated (novel) conceptual model depicting the relationship amongst the three constructs or variables and, consequently, the potential and realized (synergic) effects on internal university dynamics on the one hand and processes of adaptability to the external environment on the other. Despite its strong conceptual focus, the paper has immediate consequences for the ongoing discourses, strategic postures and managerial practices surrounding the modernization of (European) higher education.

PRIMUS INTER PARES? THE ACADEMIC AGORA SEEN FROM THE TOP (BY WOMEN)

Pinheiro, Rómulo; Geschwind, Lars; Pekkola, Elias; Foss Hansen, Hanne;

1dept. of political science and management, University of Agder, Norway
2dept. of learning, KTH Royal Institute of Technology, Sweden
3school of management, University of Tampere, Finland
4dept. of political science, University of Copenhagen, Denmark

ABSTRACT

The Nordic countries are well-known for their traditional emphasis on equality of opportunity. This paper traces the role of women leaders in academia in Norway, Sweden Finland and Denmark. In so doing, it takes stock of the number of female leaders (2004-2014 period) at the level of management and leadership structures (Rector, Vice-Rector, Director, etc.) within higher education institutions – both university and non-university sectors, in addition to the types of programs and initiatives (national and institutional levels) aimed at promoting gender equity in higher education. Qualitatively (interview data), the study sheds light on the differences and similarities as regards the roles and experiences (including major challenges) facing a selected number of current and past female university leaders across the region. The study contributes to new insights on the role of women leaders/managers within the context of a changing academic landscape, including the ways in which females at the top of the managerial higher education ladder have contributed to innovative and responsible solutions with the potential for unleashing significant structural and cultural changes in the institution of (Nordic) academia.

WOMEN ENTREPRENEURS AND THEIR ROLE IN COMPANY CREATION
EVIDENCES FROM A SAMPLE OF INNOVATIVE TECH STARTUPS

Pisoni, Alessia; Bielli, Simona

Department of Economics - University of Insubria, Italy

ABSTRACT

Entrepreneurial activity fosters the innovation and technological change of a nation (Schumpeter, 1943). Moreover, entrepreneurship is key for the economic growth of the country (Shane, 1995) and for job creation, especially when referring to new ventures (Vesper, 1996; Stangler and Kedrosky, 2010; Kane, 2010). For all these reasons, entrepreneurship has attracted the interest of scholars since many decades. In this field of research, a specific stream of research related to female entrepreneurship appears in the 1980s (Rodriguez and Santos, 2009) because of the increasing number of women that decide to turn into entrepreneurship. Nevertheless, women remain still underrepresented among entrepreneurs even/also in western industrialized countries1 (GEM, 2013; GEM women’s report, 2012; Carter and Brush, 2004; Kelley et al., 2013). Furthermore, this disparity raises questions about the entrepreneurial process/path started by women.

Gender appears to be a relevant factor, because women may still encounter many barriers in undertaking the entrepreneurial process. Empirical results are consistent with this hypothesis (Bates, 2002); the barriers faced by women owned businesses are qualitatively different than those faced by men owned firms. Such a difficulty can be determined by several aspects, like contextual factors, social structures, and family and organized life (Brush and Hisrich, 1991). According to Carter’s and Brush’s (2004) framework, it is possible to identify four categories of assets and attributes that affect, differently, men and women experiences in starting a new firm: human and financial capital, intentions, risk propensity, and family business background.

Moreover, research that investigates on the differences between businesses carried on by male and female entrepreneurs have been carried out by scholars from several countries (Cliff, 1998; Rosa and Hamilton, 1994; Alsos et al., 2006). First of all, “soft” facts, i.e. motivational drivers, have been taking into consideration while analyzing male and female entrepreneurs (Manolova et al., 2007). According

1 According to GEM – Global Entrepreneurship Monitor (2013) and to GEM – Women’s Report (2012) results again confirmed that in most economies the female entrepreneurs are outnumbered by males. Women’s participation in early stage entrepreneurship varies markedly around the world. For example, Sub-Saharan African rates of female early-stage entrepreneurship are comparable to their male equivalents. On the counterpart, the lowest relative rates of involvement in entrepreneurship by women can be found in several MENA economies and some European economies, where less than 50% of the early-stage entrepreneurs are women. As far as US, according to National Women’s Business Council (august 2013), only 17.5% of employer businesses are 51% owned by one or more women. Yet, 18.8% of employer firms are at least 30% owned by women and have a woman in a leadership role.
to Manolova, Brush, Edelman’s study (2007) on the US context, there are significant differences in motivations for starting a new business. Men result to be motivated by financial gains, self-realization and autonomy, while for women status is the main motivational driver. Other scholars argue that self-employment and financial independence are also important factors for women (Hanson and Pratt, 1991; Peters and MacDonald, 1994).

Secondly, some scholars focus on the differences in the growth rate of the companies founded by female and their male counterparts. The main difference arises in the fundraising process. Some studies have been carried out in different national contexts (i.e. Alsos et al., 2006, focus on Norway; Carter and Rosa, 1998, focus on Scotland; Watson, 2002, focuses on Australia; Verheul and Thurik, 2001, focus on the Netherlands, Hussain et al., 2010, focus on China) to try to identify the possible gender differences in fundraising and their possible reflection on company growth. Scholars outlined the difficulties that female entrepreneurs face in the early stage phases of a startup arguing that women entrepreneurs start companies with lower funding (Watson, 2002; Hussain et al., 2010) and that women-led startup are undercapitalized (Carter, 2000; Brush et al., 2004). Scholars are trying to better understand the difficulties that women face in raising financial capital, although we are still far away from an exhaustive explanation (Greene et al., 2001; Carter et al., 2006). The result is that, typically, women raise capital from relatives and friends (Reynolds and White, 1997). Moreover, women-led/owned business are often described as low performing in terms of revenues, size and rate of growth (Cliff, 1998; Gottschalk and Niefert, 2011). Industry, initial financial capital, education background, previous working and entrepreneurial experience, family entrepreneurial attitude have been investigated by different scholars as variables affecting venture performance (Fischer et al., 1993; Rosa et al., 1996; Watson, 2002; Fairlie and Robb, 2009; Gottschalk and Niefert, 2011). According to Fischer et al. (1993) there are mainly two theoretical perspectives to explain such differences in performance between women- and men-owned ventures. On the one hand, they suggest that women are disadvantaged in access to resources, i.e. in terms of human capital (education and working experiences) or financial capital. On the other hand, women have a different attitude towards risk and therefore adopt a different approach to business. However, scholars/research reach controversial results on these issues. First of all, the impact of education on venture performance has been debated a long and is still an open issue. Secondly, even though several studies show that experience has a positive impact on performance, other scholars proved that the gender gap (women have less managerial experience than men) seems to be insignificant for certain performance indicators (Fischer et al., 1993). Third, there is insofar no empirical evidence that female-entrepreneurs consciously choose to establish small firms, or organizations that grow less or slowly compared to man’s companies, because of different attitudes toward risk or different values than their male-counterpart.
To sum up, gender differences in venture performance are far away to be fully explained/covered by empirical studies. This is especially true if we consider that different national contexts have not been investigated yet under this perspective (Alsos et al., 2006).

Furthermore, other scholars analyze the contribution/role of women in team-created ventures. Although much literature on entrepreneurship focuses on entrepreneurs as individuals, many new ventures are formed by team of individuals. Godwin, Stevens and Brenner (2006), for example, focus on mixed-sex founding team and show how partnering with men may help women entrepreneurs to overcome the above mentioned prevalent obstacles providing them a sort of “legitimacy” in male-dominated contexts (i.e. access to resources/industries and diverse social networks).

Literature on female entrepreneurship has insofar focused on the aspects of analysis summarized above. Notwithstanding the increase of entrepreneurial activity among women, from the literature review it arises a substantial lack of studies focused on female entrepreneurship during the startup phase (Manolova et al., 2007). For this reason, this paper aims at filling the gap by analyzing a sample of female CEO of early stage startups. We decided to focus on the CEO being the lead person in the founders’ team and the key figure for the company and for its early strategic choices (Papadakis and Barwise, 2002). In particular we address the following research question: which are the common traits of women leading a startup founding team (CEO) and how these characteristics shape the initial phases of their newly established company?

To shed light on the proposed issue, we used Mind the Bridge 2013 dataset composed of 205 innovative new ventures from all over the world. In 2013 they voluntarily participated to Mind the Bridge Foundation Survey 2013, performed with the purpose of studying the peculiarities of different entrepreneurial ecosystems. From the database emerges that 21 startups are led by female CEO. Mind the Bridge 2013 dataset contains up-to-date data on the company profiles (year and place of establishment, industry, no. of employees, business idea description in terms of source/motivational drivers/supporters and company investment profile) and data on the founding team (nr of founders, gender, role played in the startup, education background, previous work and entrepreneurial experience). Drawing from the above described theoretical framework, we focus the analysis on the traits that women leading a startup founding team (CEO) have in common and the role played by them in shaping the initial phases of their newly established company. Further evidence is presented on the reasons behind the choice of appointing a female CEO, their professional/entrepreneurial and education background. Peculiarities of their startups are presented such as industry, product (source of the business idea) and performance indicator, such as the amount of capital raised.

---

1 Mind the Bridge is a non-profit (501 c3) corporation based in San Francisco running several entrepreneurial education and acceleration programs for innovative startups.
These findings could represent a starting point for future academic research to be performed with the support of solid econometric analysis. For policy makers these could provide further evidence on the high tech business started/led by women.

The Future of Entrepreneurship

INTRODUCING TECHNOLOGY-ENABLED HEALTH CARE: (A CASE STUDY - U.K. COMMUNITY HEALTH CARE)

Rajput, Vije; Cropper, Steve

1GP, Stonydelph Health Centre, Staffordshire, UK.
2Centre for Social Policy, Keele University

ABSTRACT

The introduction of change, in particular where it carries a strong sense of innovation, remains a contested area of knowledge and of practice. In (UK) health care, where expectations associated with innovation are especially weighty in the politically and economically charged context in which health care currently sits, the development of a body of strong, practical knowledge about innovation management is a priority. The paper reports a case study, in which new technology to support health care is introduced into a specific care team to create a form of practice known as ‘telehealth’.

Research into technology-supported innovation in health care, specifically, is rather sparse, but there is a wealth of literature on innovation implementation and diffusion, in general, on which to draw. But in their encyclopaedic review of the general innovation literature Greenhalgh et al (2005) note that “the evidence regarding the implementation of innovations was particularly complex and sparse, and it was difficult to disentangle from that regarding change management and organizational development in general.’ (p 610) And they note that “a striking feature was the tiny proportion of empirical studies that acknowledged, let alone set out to study, the complexities of spreading and sustaining innovation in service organizations.” (610). Their suggestion is for future studies that are theoretically-driven, process-oriented and sensitive to context and the dynamic interactions between the particular factors that enable or militate against innovation.

The paper also responds to suggestions that ‘further process-based studies are needed to provide a clearer evidence base for recommendations on how to facilitate the adoption and assimilation of beneficial new technologies’ (Robert et al, 2010) and that ‘of a burgeoning empirical literature, very little …makes informed recommendations for those seeking to improve their organisations.’ (Williams, 2011). It seeks, therefore, to contribute to development of an understanding - practically-based and –oriented, but with theoretical foundations - of the processes of adoption and assimilation of innovative change to health care.

We draw on work on two complementary bodies of theory. First, we draw on a recent typology of forms of ‘institutional work’ (Lawrence and Suddaby, 2006), which provides a repertoire for “intelligent, situated institutional action” (p219). Such action serves to change or to maintain institutions - ‘rules and shared meanings…that define social relationships, help define who occupies
what position in those relationships and guide interaction...” (p216). The boundaries between professional and lay action and between human carers and technology in health care practice are two such institutions under renegotiation and central to our case. Second, we draw on actor-network theory (eg Law, 1994), identified by Robert et al (2010: p6) as an approach to be explored further in healthcare innovation studies, since it highlights the ‘generative power of the socio-technical network as a whole’ rather than any one element in isolation, in explaining how change and stabilisation occur. We use these theoretical perspectives to present and analyse the basic ‘chronology’ of innovation – adoption, assimilation and routinisation, continuation and sustainability - that is now well-accepted in the literature as a framework (eg Williams, 2011). We analyse the process of change, that is, the sequence of events in relation to its intended (and realised) outcome, using the typology of forms of institutional work. Specifically, we focus on how the governance, legitimation, and alignment/integration of the elements of practice occurred to make the outcome realisable. And we give an account of the ‘intelligences’ contributed by differing professional groups as they negotiated the terms of the reordering; that is, the way different actors made sense of and so structured their contributions to the reordering.

The telehealth system that forms the specific focus of the paper invites and supports patients with a long-term condition – diabetes – to participate more fully in their care and to ensure that care resources are effectively targeted in ways that require very limited investment, either by the NHS, by the professionals or by the patients themselves. Systematic research into the value – the outcomes for patients and for the NHS - realised by this innovation (telehealth) is underway. This paper traces and examines the natural history of co-creation of value that this reconstitution of care practices enables.

The case is of a UK Clinical Commissioning Group, able to access the technology enabling telehealth and associated expertise through the UK NHS working with a health care provider organisation responsible for delivering diabetes care to a small population. We identify and explore tensions that practitioners from the health service organisations report arose in what was a most straightforward technology-supported innovation. We argue that the case we present is valuable because the tensions and the complexities arising in the process of introduction of the new practice may, perhaps, be seen the more clearly because of the straightforwardness of the technology itself. Those complexities relate to the micro-processes of innovation and value co-creation and are drawn from analysis of interviews with eight individuals directly involved in the process of introducing telehealth – a technologist, service managers, technology advisors, a GP, and Nurse Specialists. Ethical approval for the study was based on an interview guide that explained the study purpose as “to gather an account, from a variety of different perspectives and experiences, of the implementation of diabetes telehealth in this Clinical Commissioning Group”. The five substantive sections of the interview were intended to
cover the chronology and process of implementation, as follows: 1) The Health care innovation, 2) The processes of decision and pre-arrival planning for use, 3) The arrival of the technology and first steps to implementation, 4) Trialing, learning and review – who involved, where was first use etc., 5) Bedding in (routinisation – becoming ‘unproblematic’, a normal part of practice).

Our reading of the interviews focused on identifying and extracting: (first reading) the basic chronology of events; (second reading) identification of key themes – governance, legitimation, alignment; and (third reading) the pattern of forms of institutional work and the way the socio-technical system started to reform. The paper explores the following:

a) *The governance of innovation:* including how organisational attention to innovation was in tension with the emergence of individual projects and entrepreneurship and practical questions about the authorisation context – expectations of responsibility, discretion, approval and control, and accountability – throughout the innovation process. These findings have implications for the ways in which innovation might best be managed at the organisational level and for the work of individual innovation entrepreneurs.

b) *Strategies of justification and legitimation.* Within this broad question of governance, we explore the terms in which the act of imagination that started and sustained the innovation was communicated, appraised and negotiated in and between health care organisations for its ‘fit’, potential value and viability and how specific sites or locales for innovation may emerge.

c) *Issues encountered in making innovation ‘stick’ and spread.* A simple and flexible technology was introduced, but not as a validated ‘package’ of practice. Rather the innovation process gathered and ‘stitched together’ a set of fragments to form the new practice routine. We distinguish between achievements of alignment and integration that emerge from that process and suggest implications for (continuing) leadership (institutional work). Finally, we reflect on work beyond the immediate innovation site as the potential for adaptation and translation of the experience to other contexts is assessed.

THE ASSESSMENT OF CANDIDATES TO MULTINATIONAL FIRMS – UTILIZING THE CONCEPTS OF LIFE SPACE, AND ENVIRONMENTAL AND CULTURAL VARIABLES, AS A SUBSTITUTE TO PERSONALITY VARIABLES.

Rimmer, Avigdor

Department of Human Resources, Western Galilee College, Israel

ABSTRACT

There are difficulties in obtaining a reliable and valid assessment of candidates for multinational firms, where the assessors are not of the local culture. Research data of interviews including general impressions, bio-data as well personality tests shows cultural biases. The assessment focuses on the candidate competencies and personal traits, while knowledge related to the candidate's life situation, his priorities or people who may influence his career decisions, is not part of the assessment. Culture definitions in different terms and weights of the role of work versus family, religion or leisure, professional, situational and other social and factors are often missing.

Thus, we assert that the data to be used for the selection and/or development of candidates from all over the world seems to be of limited use, when we ignore environmental factors.

An alternative approach is proposed based on the theoretical concept of Kurt Lewin’s Life Space. The basic idea is to focus on the current subjective life situation of the individual and look for the individual central issues in life, instead of assuming that the person himself is everybody's central choice. The candidate is asked to draw a personal Graph, where elements are central people or central events in his career, and these elements are depicted as points. If he/she finds connection among people and/or events, he/she uses a line to show the connection. The early paper and pencil version of such an exercise was introduced to several scores of candidates for a multinational software company in various countries, such as the USA, Israel, Cyprus, Ireland, Poland, Romania, Austria, Czech Republic, India and Slovakia among others. All of the candidates were supposed to work in a different culture, most of them to be relocated. The results proved to be fruitful as an aid to the interviewing process by relieving cultural biases. Characteristics such as the different role of family in various cultures, varying roles of religion, and the degree of motivation to work “around the clock” were supposed to fit the Israeli pattern of software workers, before using the graph. After using the graph, a very different pattern was revealed. The broader picture assisted with the dialogue with candidates (Rimmer, 2008).

A new version of this tool is currently being introduced; it is more quantitative and has been developed as a software tool (the software was developed by Pilat of HI Capital group L.T.D., all rights reserved). The research examines the possible contribution of the new tool as an aid to interviews in a multinational environment and addresses the following questions:
1. To what degree does the new tool help interviewers to form a better understanding of the candidates, as measured first by the qualitative tool, and later by the quantitative questionnaire. The tool is compared with the current bio data and interview procedure.

2. How does the new tool compare with other assessment procedures with regards to reliability, concurrent validity, and relative weight in the integrated assessment process.

We intend to further develop the study along two parallel lines:

1. Develop a theory for candidate descriptions in which our own personality is not necessarily the center of our life, and situational as well as cultural factors are given the appropriate weight. New meanings to net concepts will be introduced – size, connectivity, focal points, in people life.

2. Further develop the methodology of personal net drawing to enhance the effectiveness of the tool, and improve the validity of quantitative measures derived from the personal net.

SUSTAINING GLOBAL ECONOMIC GROWTH: THE ROLE OF SOVEREIGN WEALTH FUNDS

Rios-Morales, Ruth; Mihai-Yiannaki, Simona; Schweizer, Max

1School of Management and Law, Zurich University of Applied Sciences, Switzerland
2European University Cyprus-Laureate International Universities, Cyprus
3School of Management and Law, Zurich University of Applied Sciences, Switzerland

ABSTRACT

Introduction – In the highly volatile global financial system dominated by risk aversion, liquidity pressures and asset write-downs, sovereign wealth funds (SWFs) have emerged as a critically important source of capital. SWFs represent the outcome of the highly skewed imbalances between debtor nations and nations with surpluses. Although the contribution of these funds has been widely recognized, speculation about the motives and objectives of these large funds has remained a source of controversy and debate among policymakers, market players and scholars. Two main reasons account for such concerns: the large magnitude that these funds represent and the role of national governments in the management of these large funds. SWFs represent the largest concentration of capital that the world has ever known. It has been estimated that the funds exceed five trillion dollars; this figure is expected to grow by 2015 to 12 trillion dollars. While global conditions continue to hinder the availability of capital resources, SWFs continue to increase their role as global sophisticated investors, proposing an alternative not only to encourage global economic growth, but also sustainability. The proposed research project seeks to evaluate the implications of SWFs in the global economic-financial system and their potential as source for sustaining global economic growth. SWFs have begun to tilt the balance of the governance of international macroeconomics.

Design/methodology/approach – The mixed methods of research (quantitative and qualitative techniques) will be utilized; as such an approach is appropriate for the validation of results through triangulation. The range of quantitative methods can enable the identification of the most significant variables influencing the role of SWFs in the global financial system. Whilst, the use of qualitative techniques will assist with the collection of primary data from policy makers of selected countries; the qualitative techniques will also permit us to compare strategic policies among holding countries of SWFs. Qualitative data will be collected through the survey method of research that utilizes questionnaires and interviews.

Findings – We expect that our results will clarify the factual impact of SWFs in the global economic system. Although SWFs represent the outcome of the highly skewed imbalances between debtor nations and nations with surpluses, this research project suggests that SWFs remain a potent capital source for global economic growth. We expect that our findings will demonstrate the great potential...
that SWFs represent as providers of the much needed liquidity and investment for sustaining global economic growth. It has been observed that these gigantic funds are tilting the balance of governance of international macroeconomics. The proposed research shall also contribute with important facts that the world policymakers need, so they can carry-out the necessary economic policy adjustments of global governance. We expect that this research project will deliver new empirical knowledge, theoretical and methodological advances and contribute to embryonic academic literature in this important field of research.

**Originality/value** – The phenomenon of SWFs is not a new one, the first SWF was established in 1953; however, the participation of SWFs as active global financial investors is novel. Although in recent years considerable attention has been drawn to these financial instruments and their impact on the global economy, scholarly research on the topic of SWFs remains limited. To date, no theories have been developed to analyze and forecast the impact of these new global financial players. In spite of the limited scholarly research found on the topic of SWFs, two main perspectives can be identified concerning with this topic. The core of the argument of these two perspectives has been conveyed in the above section (literature review). One perspective is much more apprehensive to the beneficial role of SWFs, while the other perspective considers that SWFs are bringing benefits to the global economy. Although SWF are receiving significant attention from policy makers, market players and scholars much remains unknown. Therefore, we consider, whilst the global economic situation continues to hinder the accessibility of capital resources, SWFs are offering an alternative source for sustaining global economic growth. Nonetheless, there is a need for international macroeconomic cooperation in which multinational financial institutions and governments alike work out together a global program, one in which these new financial players (SWFs) are consider as one of the possible solutions to future economic prospects.

LABOR UNIONS’ EFFECTS ON MERGERS AND ACQUISITIONS SUCCESS:
UNIONIZED M&A VERSUS NON-UNIONIZED M&A
Rozen-Bachar, Ziva¹; Weber, Yaakov²; Tarba, Shlomo Y.³
¹Department of Political Sciences, Western Galilee College, Acre, Israel
²School of Business Administration, College of Management, Rishon Lezion, Israel
³Management School, University of Sheffield, Sheffield, United Kingdom

ABSTRACT
The continuing global financial crisis accelerates the natural conflict between labor unions’ interests in job security and higher wages, and employers’ interests in maximizing efficiency (Becker and Olson, 1989), which emphasizes the importance of understanding how labor unions influence M&A activity. On one hand, the long crisis encourages companies to reduce costs, diversify firm activity and exploit their activities to new geographic markets through the Merger and Acquisition (M&A) strategy (Grave et al., 2012). On the other hand, the ongoing global crisis forces many companies to cut jobs, which emphasizes the importance of labor unions for the workers, particularly during workforce reductions and organizational change. From the point of view of the workers, labor unions should protect them from losing their jobs, particularly if they hold permanent jobs (Davidsson and Emmenegger, 2013).

The main concern of the decisionmakers that engage in M&A activity is that unionized M&A may result in a complicated integration process without improving efficiency or realization synergy potential. In light of that, from the point of view of the managers and policymakers that engage in M&A activity, several important questions arise: (i) Do labor unions influence M&A success? (ii) Do labor unions lead to more complicated integration processes that may harm integration success? (iii) Are there differences between non-unionized M&A and unionized M&A, with regard to M&A success that reflects through the outcomes of synergy success and efficiency success?

The existing literature that attempts to explain M&A success and failure has traditionally focused on strategic and financial factors (Stahl et al., 2013), and recently more studies have been exploring the sociocultural and human resources factors (Weber and Tarba, 2013), but still the existing literature lacks studies that examine the industrial relations factors on M&A success. There are a few studies – most of them earlier studies – that examined the relationship between M&A activity and labor unions (Armah and Peoples, 1997; Fallick and Hassett, 1996; Heywood and Peoples, 1994; Rosett, 1990), but these studies focused mainly on the motives for acquiring unionized firms or on the consequences of the M&A activity on the unions’ power.

This study seeks to fill some of these gaps. The goal of the present study is to explore the effect of labor unions on M&A success, and in particular, on integration success, synergy success and efficiency.
success, which reflect the main objectives of M&A and the complexity of the M&A process. Moreover, exploring the relationship between the labor unions and M&A success, by comparing unionized M&A and non-unionized M&A, may provide one layer of understanding, while exploring the role of labor unions as a mediator variable between the types of M&A and M&A success will help to obtain a deeper layer of understanding regarding the effect of labor unions on M&A success. The type of M&A influences the match and relationship between the acquirer and the target, which may also affect M&A success (Calipha et al., 2010). Therefore, recognizing the types of M&A may help to predict which type of M&A is more vulnerable for failure, and how the labor unions influence the relationship between the types of M&A and M&A success.

To address this goal, the present study developed mediation model in order to explain how labor unions affect M&A success. The suggestion research model is novel, and may help to understand how labor unions mediate the relationship between the types of M&A and M&A success. The model also takes into account the different stages of the M&A process. The model includes three pairs of types of M&A: international versus domestic, related versus unrelated, and different size versus similar size, which reflect the differences between the types of M&A with regard to the complexity of the integration process. The model also includes five mediator variables in order to explore the impact of labor unions on M&A success: non-unionized M&A, unionized M&A with union of the acquirer, unionized M&A with union of the target, unionized M&A with one union (acquirer or target), and unionized M&A with two unions (acquirer and target). Based on the literature, hypotheses were developed and tested using a sample of 394 public companies (197 acquirer companies and 197 target companies) that were involved in mergers or acquisitions.

Most of the companies that included in the sample were from USA, but the sample included companies from varied sectors. The sample was drawn from M&A sourcebook edition 2002, published by NVST.

The results of the study highlight the novelty of the research, particularly with regard to the differences effect on M&A success between the labor union variables. The study indicates that unionized M&A with one union, either acquirer or target, leads to both integration success and synergy success, while unionized M&A with two unions, both acquirer and target, leads to failure of the integration process. These results may suggest that the integration process becomes more complicated due the political in-fight, if the M&A involves two unions. The study even indicates that the union of the acquirer leads to a failure of the integration process, while the union of the target leads to efficiency success. This difference suggests that if the motive for the M&A is efficiency-seeking, then a target with firm with a labor union may allow the reducing of costs, while an acquiring firm with a labor union may complicate the integration process, resulting in failure.
Nevertheless, the study indicates that unionized M&A has more negative effects on M&A success than non-unionized M&A does. The results confirm the argument that unions reduce profitability. Moreover, the study indicates that non-unionized M&A leads to synergy success and efficiency success, without negative effect on the integration process. This suggests that the integration is less complicated in non-unionized M&A, resulting in improved efficiency and realization of synergy potential.

ABSTRACT

The entrepreneurial orientation is a crucial component of the entrepreneurship and strategic fields. Since the 80s, more researchers are studying the main characteristics of an entrepreneurial firm in different contexts: reflecting risk-taking, innovativeness, proactiveness, autonomy, and competitive aggressiveness (Miller, 1983; Lumpkin et Dess, 1996; Basso et al. 2009). Today, no research was interested to sum up the main works on this subject. This paper provides a bibliometric study of articles over a period of thirteen decades (2001-2013).

The bibliometric studies’ aim is to understand the evolution of a particular research field and to describe what appears (White and McCain, 1998). The bibliometric studies are based on the mathematical and statistical methods of patterns that appear in the publication (Diodato, 1994, Ramos-Rodríguez and Ruíz-Navarro 2004). Based on this aim, we conducted quantitative and qualitative analysis. A total of 312 papers were gathered from the EBSCO data base.

The following table details the number and the methodology of these papers.

<table>
<thead>
<tr>

</table>

All these collected information was analyzed through qualitative and quantitative methods. First, frequency measurements and rankings were elaborated in order to classify the main content of the 312 papers: contexts, review ranking and methodology. Four main clusters of research are identified: quantitative (Qn), qualitative (Ql), conceptual (C) and Mixed (M).

* Benchmarking reports, government and academic publications, prospectuses, archival, focus group, Documentary analysis.
For the qualitative analysis part, a content analysis is elaborated by using the « Freestyle » software (Version 1.2.23). First, it aims to sum up the main concepts used by researchers since 2001 to study the entrepreneurial orientation (EO). The determinants and the consequences of this concept were highlighted for each cluster. The map example concerning the conceptual papers is as following :

**Figure 11: EO: Determinants and consequences of entrepreneurial orientation (conceptual papers, 2001-2013)**

Second, all the used theories in the 312 papers were analyzed in order to identify and give a better understanding of the main approaches of the Entrepreneurial orientation concept. Thirteen approaches were identified as shown in the following figure.

The Future of Entrepreneurship

ENHANCING EMPLOYMENT MOBILITY IN EUROMEDITERRANEAN BASIN

WITH DEADALUS

Sakka, G¹; Frangeskidou, A.²

¹University of Nicosia and Youth Board of Cyprus, Cyprus
²University of Nicosia, Cyprus

ABSTRACT

During the last years, European Union (EU) mainly emphasises on training, education and employment (Kafouros, 2010) and focuses on increasing mobility across European countries and enhancing lifelong learning. Information technology and the use of Internet affect the Human Resource Management reality (Mansourvar and Yasin, 2014) and contribute to the above. Through the online career portals and several web tools related to job searching and career advising, the EU aims to increase employability for its citizens and to face the unemployment rate that especially affects youth. Therefore youth, employers, job seekers, students, entrepreneurs, governmental and non-governmental institutions are the main stakeholders of these portals (Stemmer et al., 2004).

Euroguidance, Eures, Ploteus, European Youth Portal, Eurodesk, EU Careers and Deadalus are only some of the European portals that are designed to satisfy EU objectives for training, education and employment. For the implementation of the above goals it is crucial to ensure the service quality of the portals and of the Webpages related to job searching and career advising (Zeithaml et al., 2002).

Deadalus (euro-meDiterranean cAreer and Employment aDvisor portal for the mobility of young residentS) is a new online job searching and career advising portal with the aim to meet the needs expressed in the labour market of Mediterranean basin and to forecast the future needs. Deadalus comes to add an additional value to the existing portals and offers its services to both, European and Mediterranean countries.

The aims of the study are to examine the existing online career portals via primary and secondary resource data and propose ideas for the development of the euro-meDiterranean cAreer and Employment aDvisor portal for the mobility of young residentS. An objective of the survey is to trace the main criteria that are necessary for the creation of a quality portal via literature review analysis. Further objective is to examine in depth the deficiencies of the portals currently in use via observations and quantitative survey (questionnaires) with the stakeholders. Further, in combination of the survey data Deadalus portal will be developed and tested via nine pilot workshops in Cyprus, Lebanon, Italy, Tunisia, Greece and Palestine. Participants in each of these workshops will be the main stakeholders via quota sampling (youth, students and job seekers; entrepreneurs and employers;
governmental and non-governmental institutions). These pilot workshops are essential for the evaluation, improvement and the development of the final portal of *Deadalus*.

The literature review analysis indicates the main criteria guaranteeing the quality of the portals and their functionality (Stemmer, et al., 2004; Mansourvar and Yasin, 2014) like feedback, communication and complaint opportunities (Yang et. al, 2004; Stemmer, et al., 2004), customisation and personalisation (Venable, 2010; Liljander et al., 2002), confidentiality, safety and privacy (Venable, 2010; Stemmer, et al., 2004), easiness of use (Zeithaml et al., 2002; Venable, 2010), reliability and validity, trust, responsiveness, storage capacity, portal aesthetics, privacy, accuracy of information, processing spread technology thrill (Zeithaml et al., 2002), interesting links and supportive services, as well as quality and variation of job postings (Liljander et al., 2002). The theoretical observations also illustrate as a gap the fact that in most online job portals the users could not find easily the information they needed, and usually there was not much information to help them (Stemmer, et al., 2004; Mansourvar and Yasin, 2014). Also it has been argued that job seekers sometimes were confused with the mass of information, claiming that they need only accurate and necessary data (Yang et al., 2004; Liljander et al., 2002).

Further, an empirical study was developed in order to assess the existing online employment portals through questionnaires distributed to jobseekers, employers and government officials in Cyprus, Lebanon, Italy, Tunisia, Greece and Palestine. The results indicated in accordance to the aforementioned literature review that most of the employment websites lack professionalism appeal, are not friendly, search engines are not comprehensive and that there is no credibility and safety but confusion. The study therefore shows outmost recommendations for enhancing the functionality of a new career portal such as *Deadalus* and innovative suggestions such as the accession of a category-section for minority groups of job seekers like elderly people seeking employment after retiring, immigrants, people with special needs, long-term unemployed and also female entrepreneurs.

*Deadalus* portal, taking into consideration the literature review, observation and questionnaire data, will be developed and tested via nine pilot workshops in Cyprus. The results of these workshops with the combination of the results of other similar workshops that will take place in the other Euromediterranean countries will determine the final *Deadalus* online career portal.

TOWARDS A FRAMEWORK FOR CHANGE: DESTINATION MARKETING IN NORTH-WEST ENGLAND

Scott, Peter; Rowland, Caroline; Moore, Neil

1Liverpool John Moores University, UK
2Chester Business School, University of Chester, UK

ABSTRACT

This conceptual paper is concerned with the ways in which destinations or places are marketed in the UK and in particular with the ways that a specific sub-region in North-West England called Cheshire and Warrington is marketed. The context within which the research is situated has been shaped by a significant change in UK government policy, by international changes in practice and by emerging themes in the literature surrounding the subject area.

In 2011 the Minister for Tourism and Heritage in the UK Government’s Department for Culture, Media and Sport published a new Government Tourism Policy (Department for Culture, Media and Sport 2011 Government Tourism Policy). This document records that 200,000 businesses operate in the British tourism industry contributing over £50bn to GDP and providing 4.4% of employment. Tourism is also one of the fastest growing sectors in the British economy (Department for Culture, Media and Sport 2011 Government Tourism Policy). The policy document sets out the UK government’s position with regard to the visitor economy including an intention to create new independent tourism bodies, to ensure that these bodies have a responsibility to engage in destination management rather than destination marketing and to significantly reduce the public funding of destination management and destination marketing activity in the future. Such a policy change will require the private sector to fill the funding gap that will be created if destination marketing/management is to continue to function in a similar way to the way in which it has functioned in the past. This may entail the establishment of a new and novel form of public-private partnership.

Exploration of the extant literature relating to this field has identified a number of emerging themes and issues. These include debates over how the consolidation of the body of literature concerning this subject area can best be achieved (Gertner, 2011; Hankinson, 2010); the lack of empirical evidence that pertains to this subject area (Gertner, 2011); the feasibility and/or desirability of differentiation in the complex area of destination marketing (Anholt, 2009); the role of stakeholders in destination marketing (Hanna and Rowley, 2011; Kavaratzis and Hatch, 2013) and the process of place or destination marketing (Eshuis, Braun and Klijn’s 2013).

The aim of the research is to establish an insight into how a destination marketing organisation can engage with its stakeholders in order to operate effectively in circumstances of reduced government
support. To achieve this the paper explores the ways in which a change of emphasis from destination marketing to destination management can be accomplished, how stakeholder engagement can best be achieved through the management of change and implications for leaders as they implement this change.

The research focuses upon the geographical sub-region of Cheshire and Warrington which is located in the North-West of England. The annual value of the visitor economy in this sub-region is £2.5bn (whycheshire.com). The study adopts an interpretivist stance and will analyse qualitative data derived from semi-structured interviews with destination marketing stakeholders and practitioners.

The key stakeholders in terms of their power and interest in respect of the destination marketing of the sub-region are the 53 corporate partners of the destination marketing organisation in the sub-region (whycheshire.com). These corporate partners include one of the UK’s largest issuers of credit cards, one of the world’s foremost manufacturers of luxury vehicles and many other smaller commercial entities. Appropriate interviewees will be sought from amongst this group of corporate partners in addition to destination marketing practitioners.

The data will be analysed by in-depth reading and re-reading in order to identify emerging key themes. It is anticipated that an appropriate software package e.g. NVivo will be utilised to facilitate exploration and analysis of the data.

The research is expected to make a valuable contribution to the subject area of destination marketing in several ways. Firstly, it will contribute valuable empirical data to a domain that is currently underdeveloped. Secondly, it will contribute to the development of a conceptual model which, after being applied and tested, will describe the optimum configuration of a public-private partnership in destination marketing/destination management. This will partially address the acknowledged need for theory-building in the field of destination marketing (Gertner, 2011). Finally the research will contribute to practice by offering valuable insight into the perceptions of stakeholders in the destination management process. This insight will be particularly useful to destination management practitioners. The importance of these contributions is contextualised by the very considerable value of the tourism industry to the British economy.

THE INFLUENCE OF MARKET INTELLIGENCE AND MARKETING MIX ADAPTATION EFFORTS ON THE PERFORMANCE OF ISRAELI BORN GLOBALS

Shneor, Rotem¹, Efrat, Kalanit²

¹Centre for Entrepreneurship, University of Agder, Kristiansand, Norway
²School of Economics & Business Administration, Ruppin Academic Center, Israel

ABSTRACT

INTRODUCTION AND CONCEPTUALIZATION

Born globals (BGs) are often viewed as a unique breed of international entrepreneurial small and medium enterprises (SMEs), with the potential for accelerated internationalisation and a global market vision (Gabrielsson & Kirpalani, 2012; Gabrielsson, Kirpalani, Dimitratos, Solberg, & Zucchella, 2008). When considering international marketing strategy of international new ventures, a review by Aspelund et al. (2007) has revealed that previous research largely ignored critical international marketing strategy question, concerning the standardisation versus adaptation/localisation of marketing mix elements (Ryans, Griffith, & White, 2003; Theodosiou & Leonidou, 2003). This question is of particular importance, both due to the effects international marketing strategy has on international firm performance in general (Cavusgil & Zou, 1994; Knight, Madsen, & Servais, 2004; Leonidou, Katsikeas, & Samiee, 2002), and the effect standardisation and/or adaptation strategy has on firm performance in particular (Shoham, 1999; Zou, Andrus, & Norvell, 1997).

Since BGs often need to deal with operations in dynamic and volatile markets (Efrat & Shoham, 2012), as well as with liabilities of newness, smallness and foreignness (Zahra, 2005), they must also exhibit strong abilities to learn, adapt and change (McDougall & Oviatt, 1996). More specifically, marketing orientation is defined as organization-wide generation, dissemination, and responsiveness to market intelligence (Kohli & Jaworski, 1990). Authors suggested that successful BGs devote active efforts to collecting and generating market-related intelligence (Gabrielsson et al., 2008; Zhou, Wu, & Luo, 2007). Nevertheless, the relationship between BGs’ market intelligence efforts and their performance has, thus far, largely gone unstudied.

Hence, the current study is seeking to address these gaps, while contributing to the understanding of BGs’ post-establishment performance.
METHODOLOGY

Data was collected from Israeli BGs, in line with Knight et al.’s (2004) operational definition for BGs, using an online questionnaire sent to a member of the managerial team. We ended up with 69 firms (23.5% response rate).

Performance was measured using the EXPERF scale developed by Zou et al. (1998). The scale includes nine items which are divided into three sub-scales of three items each measuring financial, strategic, and satisfaction aspects of firm’s performance.

Market Intelligence Generation was measured using the ten items from Jaworski and Kohli (1993) scale for the intelligence generation aspect of market orientation.

Marketing adaptation was measured based on Lages et al.’s (2008) STRATADAPT scale. We have included only sixteen of these items, incorporating items representing product, price and promotion element of the marketing mix.

FINDINGS AND DISCUSSION

Our analysis shows that market intelligence generation efforts positively and significantly affect BGs performance (p < 0.001). In this sense, our findings are consistent with earlier findings suggesting that market orientation in general impacts firm performance (Kocak & Abimbola, 2009; Kropp et al., 2006; Morgan et al., 2004; Wang et al., 2009).

Notes: significance levels - † P<0.1, * P<0.05; ** P<0.01; *** P<0.001

Our findings also show that while the sales force dimension of promotion adaptations impact BGs performance (p < 0.05), neither adaptation nor standardisation in product, price and the advertising dimension of promotions impact BG performance. Here, with respect to promotion, our findings may be somewhat similar to those by Zou et al. (1997), who showed that adaptation of customer service was significantly correlated with export intensity, while standardised promotion was not. More specifically, with respect to adaptation of sales force, our findings are also similar to those of Shoham
(1996), who identified a significant effect of sales force management adaptation on sales, profits and profit change in his sample of US manufacturing exporters.

Moreover, the finding of non-significant effects of marketing mix elements on performance supports earlier studies showing similar results (Navarro et al., 2010; O’Cass & Julian, 2003; Samiee & Roth, 1992), while further exhibiting that such findings also hold when breaking them into the specific components of product, price and advertising dimension of promotions. We concur with earlier calls for more nuanced analysis acknowledging potential contingencies (Katsikeas, Samiee, & Theodosiou, 2006; Schilke et al., 2009; Theodosiou & Leonidou, 2003). More specifically, more detailed analysis of particularities associated with specific target markets, industries, timing, and co-alignment with other firm strategies may all be relevant to understanding discrepancies in results; especially, when evaluating effects of marketing adaptation and standardisation strategies on firm performance.

Moreover, the same logic can also explain an additional interesting observation indicating that market intelligence generation efforts do not significantly correlate with any of the marketing mix adaptation elements. Here, one may again suggest that marketing intelligence informs both adaptation and standardisation of marketing mix elements at the same time, and that both occur simultaneously with respect to different specific elements and market contexts.

INTERNATIONAL STUDENTS AND THEIR DISSERTATIONS: LET’S NOT PUT SQUARE PEGS INTO ROUND HOLES

Smith, Simon M.

University of Chester

ABSTRACT

To many, the dissertation remains the crowning glory, the pinnacle of the undergraduate bachelor degree experience. For the uninitiated, this experience represents a significant challenge rife with potential stresses and burden. This is especially true for those students writing their dissertation in their second or third language. The idiom presented in the title is deliberate to highlight how easy it is to confuse those unfamiliar with a particular concept. Thus, add the language challenge to the already well-documented challenges surrounding dissertations (e.g. Day and Bobeva, 2007; Huang, 2007) and we can see how such a metaphor begins to emphasize the potential journey of a non-native speaker of English. This abstract presents some of the data from a yearlong study within a UK university that tracks a cohort of just over 300 international students completing their final year dissertation. Importantly, an innovative approach to assessing international student dissertations is examined. This leads to findings and recommendations within an under-researched area of study (e.g. Greenbank et al., 2008; Huang, 2007; Todd et al., 2004) and helps to encourage academics to contemplate the incorporation of similar innovations.

The innovative dissertation approach moved away from the traditions of submitting one large final document. Instead, the assessment was split into four parts: a research proposal leading to formative feedback; a literature review representing 2000 words and 30% of the summative assessment; a data findings and analysis submission representing 2000 words and the next 30% of the assessment; and a final full dissertation submission of 6000, whereby only 2000 words were assessed for the final 40%. Data were collected within a longitudinal approach using surveys at five different time points across the academic year before and after each assessment element. 310 dissertation students were involved in the study and the total number of usable responses from all questionnaires were 546. The nationalities used within the data collected were Chinese (participant frequency of 282), German (131), French (63) and Spanish (13) and the participant frequency represented the course cohort distribution effectively well. The following provides a breakdown of the questionnaires at the five different time points:

- Questionnaire 1: 144 responses (46.5%)
- Questionnaire 2: 104 responses (33.5%)
- Questionnaire 3: 172 responses (55.5%)
Questionnaire 4: 79 responses (25.5%)
Questionnaire 5: 47 responses (15%)

Where responses were considered particularly low in the final questionnaire distribution compared to other time points, 7 in-depth semi-structured interviews were carried out to compensate for this. The quantitative data were fed into SPSS and analysed using relevant statistical tests.

Two research questions were addressed:

1. How does the innovative assessment approach used on the dissertation impact on students’ experience?

2. What differences exist regarding nationality within the dissertation experience?

In terms of assessments, there were a number of distinct findings. One main area of focus links to the receiving of the first summative mark and feedback. Compared to later summative assessments, students were particularly unhappy with their first mark and the feedback that came with it. This becomes even more significant when considering that students were generally happy with the module up until that moment. However, happiness took a significant dip and did not recover until the final questionnaire. This shows how crucial the building process was for these international students. If they had followed traditions and submitted only one piece of work (and this could include the formative aspect of the research proposal), their experiences could have been much different. These students may not have achieved the overall success and satisfaction they desired. Within the innovative approach applied, the students had a chance to develop and adapt, and this was reflected by the final questionnaire and interviews. This is also supported by an increase overall in the average grade of each student.

In terms of nationality, it may not be surprising that Chinese students highlighted more difficulties with transition into UK studies, had greater concerns over how challenging the assessments would be, and struggled more with understanding their lecturers. However, empirical evidence is lacking in terms of tracking and understanding these issues. This was significant, for example, because Chinese student concerns over how challenging the assessments were fell into line with other nationalities by questionnaire 4. Here there is a sense of how long and arduous the journey could be for a student from China, but not impossible to overcome. Interestingly, the Chinese students recorded the highest averages in terms of happiness with the module, even though they clearly had the greatest issues. This could be put down to cultural differences and how these students respect their teachers, or possibly it could be because they have journeyed much further in terms of overcoming such issues and felt highly rewarded by this. This example is set amidst other distinct findings and it is clear that different nationalities can potentially experience dissertations in a uniquely different way.
The data highlights and supports that innovation is indeed worthwhile within the dissertation experience (Akister et al., 2009; Carroll and Ryan, 2005). This study outlines and examines one such successful approach. Thus, academics in higher education could and probably should confront the difficulties encountered by international students within the dissertation process. After all, the results can potentially increase student success and satisfaction, and this will only serve to improve student feedback and contribute to the reputation of the institution.

THE GRADUAL INTERNATIONALIZATION PROCESS OF PORTUGUESE COMPANIES DESPITE AN URGENCY TO EXPORT AND INTERNATIONALIZE: ADAPTING TO LOCAL MARKETS AND BEING OPEN TO CHANGE

Sousa, Tiago D.; Au-Yong-Oliveira, Manuel; Borges Gouveia, Joaquim

1Department of Economics, Management and Industrial Engineering, University of Aveiro, Portugal.
2GOVCOPP

ABSTRACT

This research sought to answer the following question: What are the international strategic practices currently being adopted by Portuguese companies, so that they, in the midst of a much publicized internal economic crisis, may triumph in international markets? Internationalization strategies are of paramount importance to companies from small countries and which are undergoing an economic crisis, such as is the case of Portugal, at the time of writing. According to Sune Carlson, international firm strategies advance according to trial-and-error and by gradually acquiring relevant market information. This rationale was the basis for the very popular Uppsala internationalization process model. Is this currently true also for Portuguese companies, or are they forced to accelerate the process due to rapidly declining domestic markets, occurring in the midst of harsh austerity measures? The study thus involved four case studies and qualitative research. Present in diverse international markets, the case companies chosen carefully plan the whole spectrum of internationalization activities in which they are involved, in order to achieve maximum effectiveness. We conclude that the gradual internationalization process, described in the literature, is being followed by Portuguese companies, despite an additional urgency to export and internationalize, in view of diminishing domestic markets.

DISCUSSION

The internationalization of business is currently one of the most important happenings in World economics (Viana & Hortinha, 2005). In an era of globalization a number of different actors, such as certain internationalization-related professional managers, consultants and researchers, share the view that industrial and strategic analyses should always take into account the global context (Zou & Cavusgil, 1996). The World is ever more connected, with increasingly more exchanges of goods, merchandise, information, and financial and human resources between countries (Rugman & Verbeke, 2004), new opportunities appearing every day, both for companies and for consumers.
Commercial transactions between countries (Merino & Vargas, 2013) have intensified and firms increasingly look to the market on a global scale (Zou & Cavusgil, 1996). Firms offer products and services at different geographical locations worldwide in increasing variety (Pogrebnyakov & Maitland, 2011). Internationalization strategies need to be constantly re-defined and updated, especially those related to Research and Development (R&D), production, subcontracting, and commercialization (Zou & Cavusgil, 1996). One of the most important aspects of global strategy is related to marketing, which involves direct interaction with customers and competitors present in specific markets (Zou & Cavusgil, 1996). International marketing can be defined as a “multinational process of planning and executing the conception, price, promotion of ideas, goods and services to create exchanges which satisfy individual and organizational objectives” (Onkvisit & Shaw, 1993, cited in Ilhéu, 2009, p.21), where the focus is that activity, especially commercial activity, occurs in more than one country (Ilhéu, 2009). Indeed, multinational companies tend to operate in a significant number of countries, where they seek to adjust their marketing practices to the local environment (Viana & Hortinha, 2005), be they cultural, administrative, geographic and/or economic aspects that warrant special attention (Ghemawat, 2001). So as to remain at the forefront of different markets, in relation to competitors, it is essential to be flexible and innovative, as products quickly lose market leadership (Rugman & Verbeke, 2004). Only with this capability to develop knowledge (Rugman & Verbeke, 2004), adapting to different markets and providing solutions to customer needs (Viana & Hortinha, 2005), can companies be winners in international commerce (Rugman & Verbeke, 2004). Thus, one may ask the following question: What are the international strategic practices currently being adopted by Portuguese companies, so that they, in the midst of a much publicized internal economic crisis, may triumph in international markets? “For many Portuguese companies, the size of the [Portuguese] market makes internationalizing a necessity” (Luís Portela, of Bial, cited in Ilhéu, 2009, p.13). Furthermore, internationalization strategies are of paramount importance to companies from small countries and which are undergoing an economic crisis, such as is the case of Portugal, at the time of writing. “Significant models in the field of international business describe the internationalization process as a gradual development taking place in distinct stages and over a relatively long period of time” (Melin, 1992, p.102). In the internationalization process model (Johanson & Vahlne, 1977) “a firm gradually increases its international involvement... sequential from the initial export activities to the setting up of foreign production units” (Johanson & Wiedersheim-Paul, 1975, as cited in Melin, 1992, p.103). “Each firm goes through a number of logical steps of international behavior, based on ‘its gradual acquisition, integration and use of knowledge about foreign markets and operations, and on its successively increasing commitment to foreign markets’” (Johanson & Vahlne, 1977, as cited in Melin,
1992, p.103). According to Sune Carlson, international firm strategies advance according to trial-and-error and by gradually acquiring relevant market information (Forsgren, 2002). This rationale was the basis for the very popular Uppsala internationalization process model (Forsgren, 2002; Chetty & Campbell-Hunt, 2003). Is this currently true also for Portuguese companies, or are they forced to accelerate the process due to rapidly declining domestic markets, occurring in the midst of harsh austerity measures? Portugal requested a financial bailout, in 2011, and subsequently acquired a debt of €78 billion (from the International Monetary Fund, the European Central Bank, and the European Commission) which has greatly affected a number of domestic industries, forcing companies to export and internationalize. Accordingly, the objective of this study was to analyse the internationalization strategies and practices currently being adopted by a number of Portuguese companies.

The study thus involved four case studies and qualitative research, in the form of semi-structured interviews, using an interview script, which was divided into two parts: the first with regards to firm activity; the second part with regards to the internationalization process – main markets, entry modes, barriers, destination market selection factors, obtaining market information, strategic effectiveness factors, contact with entities supporting the internationalization process, among others; questions which were based on previous research and surveys by organizations such as AICEP and Deloitte. The interviews averaged 25 minutes in length, were audio recorded, and were transcribed in full. The Portuguese companies studied operate in: 1) The retail industry (accessories); 2) The production and sale of packaging (metal and plastic) and related products and services, including the filling of packages with certain products (e.g. aerosols); 3) The assembling and test of electronic and telecommunications equipment; and 4) Components for kitchen and closet furniture and doors. Present in diverse international markets, the case companies chosen carefully plan the whole spectrum of internationalization activities in which they are involved, in order to achieve maximum effectiveness. The interviewees are decision-makers at these companies (Expansion Director, Human Resource Director, Director/Shareholder, Co-Director, respectively), involved in the internationalization process. A number of practices were reported as a result of the study which may serve as guidelines for other companies seeking to expand their businesses abroad. Thus, knowledge of the local markets being expanded to, having partnerships with other companies in the industry, possessing contacts with professionals and organizations in the business area or market, being resilient and adaptable and being able “to recover quickly from difficulties” (Oxford Dictionaries online), having an innovation capability to produce new products, having managers with experience in internationalization, and focusing on success – in order to become a leader – are some guidelines for other companies similarly seeking to expand to markets abroad. Only with considerable team flexibility, dedication and determination, can companies expand successfully into international
markets. The companies justify the effectiveness which they achieve in their internationalization efforts as only being possible “with teams capable of studying the local market, and which try to adapt to the market and be open to change” (Director of Expansion at one of the companies). The Director of Human Resources interviewee stated also that: “only with sure, consolidated steps, can one be successful [in the internationalization process]”. Thus, we conclude that the gradual internationalization process, described in the literature, is being followed by Portuguese companies, despite an additional urgency to export and internationalize, in view of diminishing domestic markets.

THE SPREADING OF THE SHIELD METHODOLOGY TO IMPROVE THE CORPORATE COMPETITIVENESS

Spanò, Isabella
Italian Ministry of Labour, Territorial Directorate of Parma, Italy.

The abstract is written in a personal capacity and does not bind the Administration to which the author belongs.

ABSTRACT

PURPOSE
The recent and still on-going world wide economic crisis has caused adverse changes in exposure to psychosocial risks, to such a point that the management efforts are focused on these risks and the means to ensure the health of workers and reduction of expenses - internal diseconomies - for example those relating to sick leave (Houdmont et al., 2012). Since the nineties (Bertera, 1990), the literature based on empirical research has amply demonstrated that health promotion programs in the workplace improve health benefits for employees and reduce health care costs for the employer, in such a way to prove the link between healthy workplaces and business productivity (Lowe, 2003).

However, a specific application of a cost-benefit analysis to compare business expenses of safety prevention and non-prevention, the latter from non-commercial risks, including psychosocial ones, did not even exist until the advent of the SHIELD methodology (Social Health Indicators for Economic Labour Decisions).

The economic approach of SHIELD is aimed at helping management to adequately develop a risk prevention policy. This was designed and then tested by Golzio (Golzio, 2011; 2014). At the heart of this method lies the reclassification of security expenses across prevention and non-prevention costs. Amongst the latter there are also sanctioning costs, which represent the state’s efforts - with the help of public employees to ensure the effectiveness of sanctions, labour inspectors in particular, to avoid through prevention, or substituting the internalising of transfer costs – of external diseconomies - from the company to society at large, which entail in extra profits for the company itself and causes social inequality.

The purpose of this research is to assess the degree of understanding, acceptance and the possible spread of a SHIELD methodology up to a broad level of managers in medium-sized companies, and to also consider and evaluate the possible role, which is played by labour inspectors/health and safety
inspectors, to facilitate implementation of this economic approach as "consultants" to employers/managers.

**DESIGN/METHODOLOGY/APPROACH**

After this fairly detailed presentation of the SHIELD methodology, the first part of the research document focuses on the use of the Delphi technique, as previously carried out in order to measure the development of a more complete picture for the health and executive safety program on Health, Work and Well-being (HSE), in terms of promoting management standards (Cox et al., 2009). The second part of the document provides a detailed example for applying the Delphi technique to promote the SHIELD methodology, by submitting a questionnaire to be completed by employers and/or managers. The third part of this paper discusses the "consultation" role of State inspectors, which must be properly evaluated in this period of global recession (Vega, 2009). From this point of view a specific training or "education of the stakeholders" (Cox, 2011; 2013) is proposed with the consequent specific roles of inspectors, in order to ensure implementation of the SHIELD methodology. The findings feature a comprehensive evaluation of these combined approaches, to effectively implement the SHIELD methodology.

**FINDINGS**

The research, taking into account the great advantage of using SHIELD methodology, above all highlights and analyses two means of promoting this methodology, as detailed previously.

**ORIGINALITY/VALUE**

The key original feature of this research is the implementation of the Delphi technique to spread the SHIELD methodology, and to also consider the possible activities of labour inspectors/health and safety inspectors to implement use of this methodology by virtue of specific training.

**Keywords**: economic crisis, psychosocial risks, workplace health promotion, non prevention corporate costs, cost-benefit analysis, SHIELD, Delphi technique, labour inspectors

SOCIAL INNOVATION AND HOW MARKETING 3.0 IS CHANGING CUSTOMER RELATIONSHIP MANAGEMENT

Toma, Mihaela¹; Ionescu, Alexandru²

¹Business Administration Doctoral School, The Bucharest University of Economic Studies, Romania
²Economics Doctoral School, The Romanian Academy, Romania

ABSTRACT

Through this paper the authors seek to provide answers to a series of questions of topical interest and specialized theory regarding the relations between social innovation and new concept of marketing 3.0 in order to learn how marketing 3.0 is affecting and transforming the concept of Customer Relationship Management. In the last years, customer expectations have changed as well as they see the products and services. Companies should change their optics and concentrate on customers from other perspectives than they did until now. The results should be social satisfaction and a good relationship between companies and their customers.

First, the authors will explain the social innovation concept, what it is and how it can be directed to the new concept of marketing 3.0.

Most of the things that are now granted in our lives usually appeared for the first time as an innovation. Geoff Mulgan describes how in specific periods in our history, civil society provided the perfect scene for creating social innovation. The wave of industrialization and urbanization was accompanied by various forms of social enterprise and innovation: building societies, cooperatives, trade unions, etc (Mulgan, 2006).

Social innovation represents all the activities and services that are motivated by the goal to meet a social need and are spread through organizations that have a social activity core. The starting point for innovation is usually an idea or a need that is not being met.

Marketing 3.0 shows that the welfare of consumers and society is the next big challenge for companies. Consumers demand more from themselves and so should the companies do.

The product value is now defined by the consumer. Companies that will adopt the new era in Marketing have bigger missions, visions and values to contribute to the world because they aim to provide solutions that address problems in the society (Kotler, 2010). The new updated version of marketing lifts this concept to the area of aspirations, values and spirits. Furthermore, it perfectly combines emotional size with the human spirit.

Even if the macroeconomic environment changes, the consumer behavior will change too, this leading to changes in the traditional marketing techniques. Over the past 60 years marketing techniques of influencing consumer behavior have evolved from the marketing centered on products (Marketing
1.0) to the marketing focused on consumption (Marketing 2.0). Marketing 3.0 is the stage when companies change their vision from focusing on the profitability to the consumer.

In the industrial era, marketing 1.0 was meant to sell products to all willing consumers wanting to buy them; it was initiated by production technology development. Marketing 2.0 came as a result between information technology and Internet; it represents the fact that the value of a product is established by the consumer and not by the companies, while marketing 3.0 represents a new era where companies are using Business Intelligence (BI) tools to predict and anticipate the need of the consumers.

Since 2000, information technology has penetrated the mainstream market and developed into what is considered to be the new wave technology (Kotler, 2010).

Some characteristics of Marketing 3.0 are as follows (Kotler, 2010):

- Objective: make the world a better place
- Enabling forces: new wave technology
- How companies see the market: whole human with mind, heart and spirit
- Key marketing concept: value
- Company marketing guidelines: corporate mission, vision and values
- Value propositions: functional, emotional, and spiritual
- Interaction with consumers: many-to-many collaboration

Having the above mentioned points, the concept of Customer Relationship Management will change as well. Phan (2010) stated that “Customer Relationship Management (CRM) is a customer-focused business strategy that dynamically integrates sales, marketing and customer care service in order to create and add value for the company and its customers”.

In order to test the three mentioned concepts: social innovation, marketing 3.0 and customer relationship management, the authors propose a research to see if the companies in Romania are prepared to embrace the new era of marketing 3.0 and if they are offering new ideas of social innovation. At later stages, another researches can be done in order to emphasize the differences between different countries in adopting marketing 3.0; for instance: developed countries vs. developing countries.

The authors of the article built a 2.670 contacts database from various industries, different companies, with different functions. A quantitative study will be run through a questionnaire that will be spread through a link via e-mail and LinkedIn network. The database will be first segmented by industry; we can choose industries were we expect that the impact of social innovation is higher and where the adoption of marketing 3.0 has premises to have a higher impact in the first phase (where consumers will be more impacted).
Keywords: social innovation, marketing 3.0, innovation, customer relationship management, customer expectation

EX-COMBATANTS AS ENTREPRENEURS: SECURING LIVELIHOODS IN WEAK INSTITUTIONAL SETTINGS

Torjesen, Stina

University of Agder, Norway

ABSTRACT

Ex-combatants face a threefold challenge of returning to society when war ends: social, political and economic. In the economic sphere reintegration back into society entails a move away on the part of the combatant from the livelihood support mechanism associated with the militia networks. Instead, as part of economic reintegration, combatants must obtain long-term gainful employment (formal or informal) or initiate other legitimate income-generating activities, which allows them to support him/herself and any dependants (Torjesen 2013). With few employment opportunities readily available and restrictions in access to land, many ex-combatants become entrepreneurs in the informal economy. When doing so they draw on experiences from the conflict years. Even if difficult and traumatic, war experiences often endow ex-combatants with important assets. They enlarge their networks, travel more widely and acquire new skills. At the same time, informal as well as (malfunctioning) formal institutions evolve in the course of war and these pose considerable constraints on entrepreneurs (Berdal and Zaum 2013).

This paper explores the relevance of theories of entrepreneurship to economic strategies adopted by ex-combatants in Tajikistan and Afghanistan. In particular it explores whether findings from other settings with a challenging institutional environments may hold relevance for post-conflict entrepreneurs. One strand of this literature looks at political entrepreneurs and notes that these agents take advantage of their positional power to maximize economic rewards (Kshetri 2009, Stark 1996). This resonates with the situation in many post-conflicts settings where many war-time leaders and former top commanders dominate the political as well as the economic spheres. Similarly to the way the soviet nomenclature successfully transitioned into wealthy capitalists after communism, wartime leaders often successfully transform from military figures to thriving business owners with considerable political influence or position (Torjesen 2012).

The more interesting question, however, may be how the former lower ranking ex-combatants perform as entrepreneurs when initiating their economic activities in the aftermath of war. While the war years offer them some social capital, they still lack the political influence enjoyed by their former commanders: How do these entrepreneurs compensate for weak political clout when attempting to succeed in a skewed post-war market place? The paper highlights mechanisms found among entrepreneurs in other ‘high velocity’ environments (Wright et al. 2005) and assesses the extent to
which they explain choices made by ex-combatants. Particularly relevant insights from other setting may include, as Wright et al. (2005) highlight: findings on network linkages (Spicer et al., 2000), the usefulness of environmental scanning (May et al., 2000), the need for risk taking (Makhija and Stewart, 2002) and the relationship between institutional transitions and adaptive capabilities (White and Linden, 2002).

The paper ends with a comment that the literature on entrepreneurship so far seems underutilised by organisations and policy makers that attempt to address the plight of ex-combatants. It notes some immediate insights that might be readily assessed and, possibly, acted on by these organisations.

FINANCING HIGHER EDUCATION FOR PROSPERITY: A COMPARATIVE STUDY OF TURKEY AND EU

Tosun, Ayşe Nil; Bağdadioğlu, Necmiddin; Tosun, Mustafa Umur

Hacettepe University, Faculty of Economics and Administrative Science, Department of Public Finance

ABSTRACT

Nowadays, there is an increasing competition for where to spend scarce public resources in many countries. Designing a higher education system which will lead to a prosperous future involving less poverty and fairer income distribution is costly. Weighting public against private benefits derived from higher education, its costs could theoretically be covered through either full funding of government or self-finance of students or a combination of both. In practice one could find examples of each financial approach but recently in many European countries, national systems and institutions have been initiated some sort of cost sharing scheme involving financial contribution from students or their parents.

For example, in Australia the government has announced in the fall of 2000 that universities would introduced a tuition fees system. For instance, in Germany in January of 2005, after a long debate, the country’s Supreme Court decided that individual states could introduce tuition fees. In Sweden, even though public higher education is free, the institutions may charge a small fee. In the United Kingdom, each constituent country sets its own policy and decides its own funding methodology via its individual funding council. Furthermore, there are many other differences between countries in financing higher education system, like credit systems, spending discretion in universities. In this study the theoretical background of the free public education especially free higher education is discussed. Then the findings of the International Comparative Higher Education and Finance Project is compared with statistics belong to Turkish Higher Education System. Comparing the higher education finance approaches pursued in EU and its prospective candidate Turkey, this paper identifies, among others insufficient credit mechanism, lack of autonomy in determining students’ fees particularly by public universities and absense of spending discretion in public universities as important shortcomings of the Turkish higher education system.

ABSTRACT

RESEARCH AIMS

The main goals of the study in progress are: (a) learn about the image of four countries - Greece, Israel, Poland and Portugal - as foreign travel targets in the eyes of young Greeks, Israelis, Poles and Portuguese; (b) examine its impact on their willingness to travel and their actual choice of tourist destination; (c) elucidate the effects of contextual factors such as cultural values, prior traveling experience, sources of travelling information and the use of social networks (such as Facebook) on shaping the image and intention to travel to each of the four destinations and (d) examine the attitudes towards risk taking of young Greeks, Israelis, Poles and Portuguese with regard to their travelling abroad. The study seeks to discern similarities and differences in young tourists’ perceptions with regard to the four travelling destinations.

THEORETICAL BACKGROUND

The global economic crisis is impelling countries to promote incoming tourism as one of their leading industries. The number of international tourists has exceeded one billion in the year 2012 and is anticipated to reach well over 1.8 billion by the year 2030 (UNWTO 2013). Concurrently, the number of potential destinations increases every year as more and more countries discover the economic
potential of tourism. In order to understand the choice of a specific destination it is important to explicate the destination selection process (Son & Pearce, 2005). Thus, researchers focused on the concept of destination image (Baloglu & McCleary, 1999; Govers, Go & Kumar, 2007; Moura, Gnoth & Deans, 2014; Pike, 2002). The findings point out that the potential destination competes mainly on the basis of the image held by the tourists. Consequently, policy makers in a destination have to invest efforts in creating and projecting abroad a favorable image. In order to accomplish this marketing task, each destination needs a good understanding of its image in the eyes of potential tourists along with a grasp concerning the perceptions of rivalry destinations (Javalgi, Thomas & Rao, 1992).

Several studies revolved around the factors shaping tourists’ impressions of destinations. Among these factors were prior traveling experience and cultural values. Travelling experience tends to produce a more favorable image with regard to the destination and more tolerant attitudes of the experienced tourists in comparison to novices (Andreu, Bigne & Cooper, 2001; Beerli & Martin, 2004). Prior studies examined the role of cultural values in shaping tourist destination image. For example, a recent study showed that information displaying incongruent cultural values concerning a destination on a website tended to produce a more favorable destination image in comparison to information portraying congruent values (Moura, Gnoth & Deans, 2014). The authors argue that cultural congruity enhances the familiarity of the user with the destination site, thus reducing possible novelty elements. Reisinger and Crotts (2009) examined the effects of Hofstede's cultural dimensions on perceptions of touristic destinations. They found differences between tourists from Southeast Asian and Western countries on specific cultural dimensions, such as measures of the value of long-term commitments, respect for the past and tradition, persistence, patience, and social stability of a nation. The study also showed that tourists from the United Kingdom were more individualistic and less risk-averse than all other nationalities.

Other studies focused on the source of information as a factor shaping a destination image. Extant findings portray rather equivocal and often contradictory findings in this domain. Hence, the current study attempts to expand knowledge concerning the effects of various sources of information about destinations (e.g., travel-related websites, social networks, local and international news, travel agencies) on destination images in the eyes of young tourists. The current research underscores explicating the effects of social media as this is presumably the most frequently used source of information by young tourists.

HYPOTHESES

a. Prior experience: Experienced tourists to the four destinations will exhibit more tolerant attitudes towards a destination in contrast with first time visitors. This hypothesis is based on
the findings of Andreu, Bigne & Cooper (2001) that tourists who had previously visited Spain exhibited a more favorable opinion concerning the “value for money” and “culture” than those who had not previously visited Spain.

b. Sources of information: the impact of the internet (e.g., travel-related websites, social networks such as Facebook) on destination images in the eyes of young tourists is expected to be stronger than the impact of other source of information (e.g., travel agencies, and other media sources). Although, Beerli & Martin (2004) found that the main source of information which influenced the tourists’ cognitive image was the travel agency, whereas internet was not a significant factor, we believe that in 2014 (ten years later) the impact of the social networks on attitudes and decision making of young people is much stronger and more crucial than in the past.

c. Congruent/ incongruent cultural values: perceived incongruent cultural values concerning a destination (in the eyes of a young tourist) will tend to produce a more favorable destination image in comparison to perceived congruent values. This hypothesis is based on Moura, Gnoth & Deans (2014) findings. The authors argue that cultural congruity enhances the familiarity of the user with the destination site, thus reducing possible novelty elements. For this reason, leisure tourism represents a context in which high congruity seems inappropriate.

d. Cross-cultural differences and similarities among young tourists. On the one hand we expect to find similarities in the main factors affecting young people from different countries to travel abroad, but on the other hand we expect to find different factors affecting the images of destination countries in the eyes of young from different countries. For example, we expect that the factors affecting young Israelis who served in the army to travel abroad will be different from young people from other countries. Since we do not have a solid hypothesis we leave this as an open research question. The same applies to the attitudes towards and willingness to take risks when travelling abroad especially with regard to the Greek and Portuguese young tourists.

METHODOLOGY

The study is conducted simultaneously in four countries: Greece, Israel, Poland and Portugal. The reasons for choosing these countries are as follows: Poland attempts to increase tourism of young people, especially from Israel as part of the effort to rebuild the relationships between the two countries. Greece and Portugal suffer from economic crisis and in both countries tourism constitutes a significant driving force of the economy. Due to the harsh economic situation, those countries are interested in expanding tourism to new markets including young tourists and Israelis. Israel experiences a protracted national conflict reflected among other negative experiences in a high prevalence of terror, and tourism is one of the main sources of foreign income. In addition the four
countries are represented in EMRBI seeking to extend areas of comparative research. The study focuses on young people - ages 20 to 30. The research takes place in several academic institutions and attempts to recruit matched samples of about 200 students of various academic study areas (women and men) in each country, statistically sampling students through the lists of mandatory classes.

A functionally equivalent self-report structured questionnaire will be administered in each of the countries in their respective languages: Greek, Hebrew, Polish and Portuguese.

At the first step, the data will be statistically analyzed separately in each of the four countries. This phase will yield mainly descriptive statistics. Subsequently, the four data sets will be pooled and advanced statistical analyses will be conducted with the aim to unveil causal relations between variables horizontally across the combined population of students.

Initial results of the comparative study will be presented at the EuroMed 2014 conference.

DETERMINANTS OF FIRM COMPETITIVENESS: THE CASE OF MANUFACTURING FIRMS IN GREECE

Tsoukatos, Evangelos; Voulgaris, Fotini
Technological Educational Institute of Crete, School of Management and Economics, Department of Accounting and Finance

ABSTRACT

Purpose: On evidence from Greek manufacturing small, medium and micro enterprises, this study aims at analyzing and modelling determinants of firm-level competitiveness. The study assimilates firm, industry and institutional level, innovation, R&D and technology, elements to investigate their integrated and individual effects on firm competitiveness, while also investigating between factors interconnections.

Design/methodology/approach: The study investigates the integrated and individual effects of innovation, R&D and technology at firm, industry and institutional levels on firm competitiveness. At the same time, it investigates interconnections between the former. 400 manufacturing small, medium and micro enterprises from all industry sectors were surveyed. Drawing from previous literature the research instrument was designed to provide evidence on innovation, R&D, inter-firm cooperation as well as institutional and technology related organizational practices and perceptions. Aspects of firm performance and export activity were also considered. Firm competitiveness was measured in terms of profitability, market share as well as cost efficiency. Exploratory factor analysis and reliability analysis were employed for factor extraction and the theoretical model was tested through Structural Equations Modelling analysis.

Findings: The findings suggest that all three sets of explanatory factors had a positive impact on firm performance and competitiveness, both individually and on the aggregate. At the same time the estimated model sheds light on the interconnections between factors. Firm – level innovation proved to have the strongest effect, among factors, on firm competitiveness.

Originality/Value: The Greek industry is seriously hit by the economic crisis, which is even more the case with the country’s manufacturing sector. The originality/value of this study rests upon two pillars. First, this is the first study investigating the effects of firm, inter-firm and institutional level management aspects on firm performance and competitiveness, thus providing policy makers and management with valuable insight on that matter. Second, the study is implemented under severe crisis conditions; thus, providing unique opportunities for creating both practical and theoretical knowledge that will prove useful in the post-crisis era.
**Implications:** The findings have implications for practitioners, managers and policy makers. Managers get valuable insight on the positive effects of innovation, R&D and technology on firm performance when it comes for them to devise strategies towards enhancing their firms’ competitiveness. Policy makers should support institutional and inter-firm cooperation and provide support for the application of innovation and new technology. Manufacturing products should not compete on price only but mainly on quality and product differentiation so that manufacturing firms’ competitiveness is maintained, imports are substituted, the trade deficit is decreased and subsequently the growth of the manufacturing sector is restarted. Innovation and R&D can successfully contribute towards the formation of competitive advantage in dynamic markets worldwide.

PUBLIC - PRIVATE PARTNERSHIPS WITH EMPHASIS ON FAILED CASES

Tzigkou, Dimitra
Technological Education Department of Ionian Islands, Greece.

ABSTRACT

According to the Special Secretariat for Public Private Partnership (PPP), PPPs establish a vital modification to the construction of public organization and the establishment of qualitative services to citizens. They usually are long-term contracts, concluded between the public sector and the private one, either for immobile constructions or for delivery of services. PPP is a modern world-wide tool and exemplifies the school of thought in New Public Management (NPM). NPM movement began in the United Kingdom under Prime Minister Margaret Thatcher, so as municipal government to come up against with economic recession and tax revolts.

The success of a PPP contract depends on many factors, such as the completeness of the contract outline and, the accuracy and clarity of the contract terms, and their success is not always guaranteed. There are several examples of failed PPPs, some of which are discussed and analyzed below, in order to discover the reasons of failure and how these can be avoided. A comparison of a successful and an unsuccessful is also given so as to emphasize the importance of proper design of a PPP program. The main questions examined here are: Which are the main reasons behind a failure? How a failure can be confronted by the public sector? Was it the public or the private sector that had the greater responsibility for the failure?

LONDON UNDERGROUND PPP, UNITED KINGDOM

In 1998, the UK Government suggested the renovation of the London Underground using a PPP. In 2002, London Underground Limited (LUL) signed 30-year contracts with the Metronet and Tube Lines consortiums for the maintenance and regeneration of the lines. LUL operated the transport system, whereas the engineering consortiums were responsible for the infrastructure renovation. There were several problems in the conduct of this PPP from its beginning. On one hand, the agreement involved high profits for the consortiums with small amount of risk from their side and contracts with complicated terms. On the other hand, practical problems such as high costs and safety consequences also existed. As a result, in 2007, Metronet visited the administration and the publicly owned Transport for London took over its contracts while two years later, the works of Tube Lines had a funding shortfall and demanded further public money. In May 2010, Transport for London bought out Tube Lines and the PPP efficiently ended and characterized as a non-reciprocal partnership.
AREN A ZAGREB, CROATIA

Arena Zagreb is the largest sports hall in Croatia and it was opened in 2009. The project was established between the City of Zagreb, the Republic of Croatia and the Ingra-TriGranit consortium as a non-reciprocal PPP. The contract between the partners involved the payment of the maintenance costs to Ingra for the next 28 years. In July 2009, the company was already 600.000€ in debt. In order to cover the costs of loans, Arena Zagreb presented events for 71 days. It was expected that the Arena would be employed for 154 days until the end of the first year, but finally it was impossible to produce profit. By the end of the second year, the maintenance costs were 4 times higher than predicted in the contract. Ingra invested for Arena Zagreb and Zagreb Holding, which was the City of Zagreb’s municipal company, paid the funds. Ingra decided to close down Arena Zagreb and required at least €4 million in order to open it again. At the end of January 2011, the City of Zagreb and Zagreb Holding covered the debt to Ingra and the Chief of Zagreb’s Department for Finance Slavko Kojic claimed that the Arena was too expensive and it could have been constructed for one third of the total cost.

COMPARISON OF PUBLIC PRIVATE PARTNERSHIPS OF ROAD CONCESSIONS IN CHILE AND MEXICO

In this section, a successful PPP taken place in Chile from 1993 till 2001 is discussed and compared with an unsuccessful one taken place in Mexico during the years 1987 and 1995. In the first case, Chile was awarded with 21 road concessions that worth $5 billion on a competitive basis. The bidding started with smaller projects, in order to research the market and decrease the risk for the private sector. The bidding achieved to attract 27 consortiums and more than 40 Chilean and foreign companies from 10 different countries. The specific program was characterized as transparent and competitive, with just one minimum revenue guarantee. This PPP turned to a success because the procurement process was transparent and the Government made adjustments as the program was developed. In addition, the project was focused on creating public awareness (tolling culture) and managed to attract international firms that brought finance and credibility.

In the case of Mexico, 52 projects were awarded 25 of which were competitively tendered. By the end of 1995, the 34 projects had reached a financial closure of $9.9 billion in private investment. The shortest concession period (maximum 15 years) would win, but this action would lead to very high tolls. As a result, the road concessions were bound to have a parallel toll free road. The overrun average of construction cost was 25% and average actual revenues were about 30% below forecast. Only 5 of the total projects met or exceeded targets and, as a result, the average of the toll road fee was increased. The government took over 23 projects and paid outstanding debt to Mexican Banks and to
construction companies. The reasons for the failure in this case can be tracked in the combination of small contract duration and low traffic resulted in high tolls, the existence of free roads contributed to financial distress of concessionaires and, the program resulted in massive Government bail-out.

CONCLUSION

In this submission, one case of successful PPP and 3 cases of failed ones are analyzed, in order to find out the reasons for this failure. The main result of this research is that the reasons for a PPP failure may vary. They may be attributed to inadequate or non-existent feasibility studies, including unrealistic traffic forecasts and undefined public contribution of funds. Or, they can be a consequence of reasons such as: a poor legal framework and enforcement, a weak institutional capacity and PPP strategy, lack of thorough financial and economic analysis, an inappropriate sharing of risks or, lack of competitive procurement and the public resistance.

So, PPPs should not be presented as the only solution for public sector facing budget limitations. Instead, every time the organizational and economic choices of PPPs should be examined carefully and, the real added value over other choices should be given. An influence, according to the regulations and managerial implications of NPM, could positively affect and even improve failed cases of PPPs. This can be a subject of future study on other kinds of PPPs.

UPSTREAM PETROLEUM INDUSTRY” OR “DOWNSTREAM PETROLEUM INDUSTRY

Valiantis, Marios; Homayoon, Morvarid
University of Nicosia

ABSTRACT
Cyprus is located at the crossroads of Europe and the Middle East and its strategic location has made it a reputable international business and services center. In 2004, Cyprus became a full member of the European Union (EU). In January 2011, Noble Energy announced the discovery of one the largest offshore natural gas reservoirs in the world, near Cyprus (offshore Israel) which would benefit Cyprus as well as Europe. The oil and gas industry has grown strongly over the past decade and its outlook is equally positive especially in the eastern Mediterranean areas. The natural gas revenue can change the national economy and could potentially have an impact on the people’s livelihood. According to Cyprus government officials, the recent findings of the natural gas could strengthen the country’s financial position, wealth, and standard of living of Cypriots in the near future. But is Cyprus going to achieve this economic growth? Reviewing the past and present studies of the oil & gas countries shows that many countries, after finding oil and natural gas economically collapsed(Ex: Dutch disease) but, there are also many countries that had economic growth. What is really the reason behind these two different results?

Norway is one of the most famous examples of the oil & gas countries with economic growth, Norwegians have been enjoying a high standard of living for many years which is not only due to the country having oil and natural gas deposits, but also because of Norway developing the “Science of using oil & natural gas”.

The oil & gas sector is operating in an environment of unpredicted opportunity, mixed with a high degree of volatility and risk. Therefore the science of using oil and gas which makes a solid innovation strategy on the ways of adding value to the oil and natural gas will help the country to be different in its competitive position. According to Porter, the value chain is a device that helps to identify the independent, economically viable segment of the industry. In every industry there are various activities that must take place to transform inputs of raw materials, knowledge, labor, and capital into end products purchased by customers. The oil and gas value chain has three main segments: Upstream (Exploration and production); Midstream (Transportation and Trading); and Downstream (Refining and Marketing). The industry value chain starts with exploration and ends with products sold to consumers such as gasoline, heating oil, natural gas for heating and power generation, and thousands of petrochemical products. Some countries which have oil and gas reserves
try to be competitive in the upstream industry and some others in the downstream industry but what about Cyprus? Can Cyprus be a competitive player in its oil & gas downstream industry?

As was mentioned before Norway is one of the headline countries that by achieving the science of using oil & gas, has gained and continues to gain profits from its oil and gas industry. The fact that oil & gas countries can gain profits from selling the oil and gas is obvious but the competitive advantage will appear when a country can build a strong industry which focuses on selling petrochemical products. Therefore, the main aim of this paper is to indicate the role of Cyprus’s upstream and downstream petroleum industries and to determine ways for adding value to the Cyprus’s natural gas.

Following the aim of the study the objectives are to study and review the past and present literature of the oil and gas countries which have been successful in developing a competitive upstream or downstream industry, especially Norway, and comparing them to Cyprus in order to indicate investigating in which industry is more possible and profitable for Cyprus as a competitive advantage. According to the aim and objectives of this study, inductive approach is going to be applied. The structure of this research is not numerical so qualitative information and primary data focusing on in-depth interviews will be used as well as getting help from secondary data.

FAMILY OWNERSHIP AND MODES OF INNOVATION: THE CASE OF SOUTHERN NORWAY

Wallevik, Kristin; Jørgensen, Geir; Ricke, Michael

Agderforskning, Kristiansand, Norway

ABSTRACT

Our focus is on innovation and development in traditional industries in Agder, a region in the southern part of Norway; one of the most heavily burdened labor-cost countries in the world. Despite the cost challenges, the firms in the region have maintained their international competitiveness in heavy and other traditional industries over a prolonged period of time, through good and bad economic climates, and have avoided the exodus experienced by other superficially similar regions. A substantial portion of these firms are family owned. More specifically, the paper will present a case study from the Agder region, including empirical data from 220 of the region’s firms, in six separate industrial branches encompassing the extreme shock period of 2006-2012. The study also includes 20 in-depth interviews focusing on the effect of family ownership on the modes of operation and innovation, as well as economic development. Our main research question is whether family ownership affects the modes of operation and innovation and hence, enhances competitiveness in certain industries.

INTRODUCTION

This paper analyzes how firms innovate to remain competitive in traditional industries, with a specific emphasis on modes of innovation in family firms. According to Jensen et al. (2007), firms organize their innovation strategies along two primary axes. The first, the Science, Technology, Innovation method (STI), is an approach where the research project is the starting point for the process of innovation, either within the firm or through cooperation with universities or research institutes. An alternative innovation approach, Doing, Using, Interacting (DUI), lends itself to innovation where product and process learning occurs on the job and through interactions with the customer in order to customize or develop a product. Critical factors to the success of DUI are a highly skilled workforce, flat organizational structure, and decentralized responsibility, in addition to demanding customers and suppliers. Isaksen and Karlsen (2010) maintain that firms’ that distinguish themselves concerning innovation combine the STI method of innovation with the DUI type, in a so-called Complex and Combined Innovation (CCI). Our findings propose that family firms tend to innovate in the DUI or CCI modes of innovation, focusing on existing knowledge within the organization in combination with external partners and networks.
THEORETICAL FRAMEWORK

In the analysis on how family firms operate and innovate, we will propose a theoretical construct derived from social capital theory focusing on; social reputation and responsibility, trust, social relations, shared visions and knowledge (Granovetter, 1985; Burt, 1992). Arregle et al. (2007, p. 77) describe family social capital as “one the most enduring and powerful forms of social capital”. In an innovation context, one could then argue that the social capital in family firms can contribute positively in responding to changes in the business environment. Adler and Kwon (2002) state that social capital may affect resource exchange on different levels enhancing the creation of intellectual capital, inter-firm learning, supplier interactions, product innovation, and entrepreneurship. In addition, perspectives developed from analyses on the German Mittelstand will be discussed; focusing on ownership, long term perspectives, local commitment and workforce, to mention some (Simon, 1992; 1996; 2009). Based on the special characteristics of the family firm we also discuss different modes of innovation in line with the framework presented by Jensen (2007) and Isaksen and Karlsen (2010), analyzing the special characteristics of family firms into this innovation framework.

DATA AND METHOD

We employ proprietary financial and governance data composed of multiple variables covering the empirical characteristics of 220 of Agder’s firms in six separate branches from 2006-2012. The chosen branches can be classified as traditional industries like: 1) the process industry, 2) the oil- and gas-extraction equipment and machinery industry, 3) the leisure boat industry, 4) the mechanical industry, 5) the wood processing and wood working industry, and 6) the food processing industry. Also, we have conducted 20 in-depth interviews with owners and/or top managers to obtain a better understanding of how family firm characteristics affect the innovation process in these firms. Here we focus on tacit knowledge, knowledge sharing and development, effects of organizational structure, management and leadership, long term perspectives and traditions, as well as the owners’ commitment to the local community.

Our main research questions are:

1) Does family ownership affect the way firms operate and innovate?

2) Are there attributes within the family ownership structure that nurture special modes of innovation?

3) Are there some industries where family ownership appears to enhance innovation and competitiveness more than others?
FINDINGS AND CONCLUSION

In this paper we focus on how the attributes of family ownership like: long term traditions and perspectives, the local community, organizational structure and other family firm characteristics, affect the modes of operation and innovation. Even though firms innovate differently we find that the family firms in our sample tend to have more incremental innovations in line with the Doing, Using, Interacting (DUI) method, compared to the more research based methods of innovation. Furthermore, we find that family ownership seems to be an asset within some industries. This especially seems to apply to the industries we can define into the “Mittelstand framework”; where focus is on combining increased competitiveness through new development with the maintaining of long term local traditions. One of the clusters within the mechanical industry in our sample is the Lister Alliance and their slogan is: “Deeply rooted – always moving”. This gives a description of how many of these firms work with innovation.

STRATEGIC AGILITY AND MERGERS AND ACQUISITIONS PERFORMANCE

Weber, Yaakov; Junni, Paulina; Sarala, Riikka Mirja; Tarba, Shlomo Yedidia

1College of Management, Israel
2BI Norwegian Business School, Norway,
3University of North Carolina at Greensboro, USA
4University of Sheffield Management School

ABSTRACT

For the last three decades, the management literature has been trying to explain the paradox of the dismal performance track record of both cross-border and domestic mergers and acquisitions (M&A) vs. their increasing activity in terms of the number of deals and the volume of involved capital. Recent meta-analytic studies on acquisitions (King, Dalton, Daily, & Covin, 2004; Stahl and Voigt, 2008) have not provided clear answers for why M&A remain popular despite of their high failure rate. A possible answer to this paradox is that the existing research on M&A provides a limited and insufficient understanding of the phenomenon, especially concerning the post-merger integration process (Gomes, Weber, Brown, & Tarba, 2011; Weber, Tarba, & Reichel, 2011). These findings pose a great challenge for researchers in the field of M&A and suggest a need to continue to research in-depth and in-breadth the parameters that influence the overall M&A success (Weber et al., 2011).

To address this, in our research, we use the concepts of strategic agility. While the concept of strategic agility has received increasing attention, it has neither received consistent treatment nor clear articulation of its effects on a firm’s performance (Weber and Tarba, 2014). Instead, strategic agility has remained an elusive term with many definitions across various situations. The first contribution of this research is the clarification of the concept of strategic agility based on common theme that emerged in recent years.

Second, we will use the concept of strategic agility to develop theoretical explanations for the current paradox on M&A that was described above. More specifically, we show that acquisition processes and outcomes vary primarily based on whether the acquirer possesses strategic agility in terms of:

a. Identifying suitable targets, and,

b. Integrating them with the acquiring firm to create value.

This research provides clear directions for future research and managerial implications for executives to improve M&A performance.

HOW MENTORING CAN IMPACT WOMEN’S USE OF VOICE

Whitehead, Lisa; Falkenberg, Joyce

School of Business and Law, University of Agder, Kristiansand, Norway

ABSTRACT

The aim of this paper is to contribute to the explanation of predictors of voice. In this paper we report the findings of a study on the impact of mentoring on an individual’s identity and her use of voice or silence in different situations.

An individual’s identity focuses on the question of *who I am* in relation to others (Goffman, 1959; Mead, 1934; Whetten and Godfrey, 1998) as well as *who I would like to become* (Markus and Nurius, 1986). We argue that individual identity is important at an organizational level in defining a person’s work-related self, which in turn is related to the use of voice in an organization.

Mentoring provides a form of social support from an individual with advanced experience and knowledge (the mentor) to a less experienced and knowledgeable individual (the protégé) for the purpose of advancing the protégé’s development and career (Sosik and Lee, 2002).

The paper reports on a qualitative study of a pilot mentoring program spanning across two Norwegian heavy industry clusters. The program was specifically developed for this group starting with 10 protégés and their mentors. The protégés were middle managers, eight women and two men; five of the mentors were women, five were men.

Findings of the research indicate that mentors contributed to protégés’ concept of self (identity), for example, in terms of becoming more strategic as managers. In terms of voice, they gained an understanding of the use of upward communication including issue selling (Dutton et al., 2001) and silence (Morrison and Milliken, 2000, 2003) and became aware of tactics and targets of voice such as how to frame information, when, where, with whom to voice their views or concerns (Dutton et al., 2001; Piderit and Ashford, 2003).

By including individual identity, the paper contributes to the explanation of predictors of the use of voice or silence in Morrison’s 2011 model, as well as how voice or silence can be used in an organization. The paper also contributes to our further understanding of the tactics and targets of voice in issue selling upwards (Dutton et al., 2001; Piderit and Ashford, 2003).

THE DETERMINANTS OF HRM PRACTICES’ TRANSFER PROCESS WITHIN MERGER AND ACQUISITION

Yahiaoui, Dorra¹; Chebbi, Hela²; Weber, Yaakov³

¹Kedge Business School
²Ecole Paris Business School
³School Of Business Administration, College Of Management

ABSTRACT

The question of how practices travel from one organization to another has recently attracted growing attention of several social sciences (Guillen, 2001; Meyer et al, 1997), technology (Rogers, 1995) and management (Weber and Tarba, 2010; Weber and Fried, 2011; Weber, Rachman-Moore and Tarba, 2012; Teerikangas, Very and Pisano, 2011; Kostova and Roth, 2002; Djelic, 1998; Gooderham et al., 1999; Flood et al., 2003; Gamble and Huang, 2009; Yahiaoui, 2010) fields. However, research on intra-organizational knowledge transfer and especially the HRM practices transfer are much more abundant than those conducted on inter-organizational context (Weber, Rachman-Moore and Tarba, 2012; Ahuja and Katilla, 2001; Bjorkman et al, 2007; Ranft and Lord, 2002; Sarala and Vaara, 2010; Haleblian et al.2009). Although one of the main objectives of M&A is to seize the synergy potential through knowledge transfer (Weber, 2012), few studies point on the complexities of this transfer and mixed results (Junni et al., 2012; Weber, Tarba and Rozen Bachar, 2011).

The recent increase in number of mergers and acquisitions versus their high failure rate (Weber, 2012) as well as the ambiguity, difficulties and uncertainty (Björkman et al, 2007) caused by the integration of two separate organizations make the study of knowledge transfer necessary and urgent. Recent studies have point on the importance of HRM practice transfer to acquisition performance and the need for more studies (Birkinshaw et al., 2000; Weber and Fried, 2011; Weber et al., 2012). For example, what are the main characteristics of HRM practice’s transfer process? What are the similarities and differences between the HRM practice’s transfer and the knowledge transfer process? How these practices are articulated, re-contextualized and re-used by the acquirer and the target? What about the factors that may influence the integration of these practices within a new group?

According to Junni et al (2012), knowledge transfer in general can be affected by four main categories of variables: knowledge characteristics, sources and recipient characteristics, such as similarities and differences, absorptive and disseminative capacity (Gupta and Govindarajan, 2000; Cohen and Levinthal, 1990), and the relationships between them and knowledge integration mechanisms. These may be transferred by such practices as training, autonomy and communication (Weber and Tarba, 2010) or sociocultural mechanisms such as values and shared identity. For example, some of those can be done by joint training program (Bresman et al., 1999) and use of expatriates Based on these four
categories, Junni et al (2012) described factors affecting knowledge transfer in a specific context of M&A.

Table 1 An overview of empirical knowledge transfer studies in M&A (adapted to Junni and al (2012, p 113-117))

It is interesting that certain factors influencing the knowledge transfer in Merger and acquisition are common to those highlighted by previous research made on managerial practices’ transfer within Multinationals such as organizational identification, trust, integration, complementarity, relational context (Kostova and Roth, 2002), negotiation and conflict resolution abilities (Leyland, 2005), intensive communication, national culture and strategic similarities (Flood et al., 2003; Bartlett et Ghoshal, 1988). However, the relationships between the source and the recipient of knowledge are more complex in M&A than in other situations such as multinational organizations. For example, knowledge transfer process needs a climate of affinity, mutual respects and trust (Junni and Sarala, 2011; Bresman et al, 1999; Cabrera and Cabrera, 2005) that are often missing in M&As due to culture clash, stress and negative attitudes, lack of cooperation and commitments, and high level of turnover of top executives and key talents after the merger (Weber, and Drori, 2011; Weber, Shenkar and Raveh, 1996; Weber, 1996). The characteristics of the acquirer and the target are also fundamental in the knowledge transfer process, such as the absorptive and the disseminative capacities that can affect the effectiveness of the knowledge transfer process (Junni et al., 2012).
According to these various researches, we can notice that a special attention was paid to the acquirer, the target firm in a knowledge operation, the interests of the knowledge transfer and the factors that would, influence this process. However, most of these researches were made on knowledge transfer and no one on HRM practices within Merger and acquisition. Several factors that would influence the transfer process were highlighted but no research describes the conditions, the legitimacy and the obstacles that encounter the HRM practices traveling between the two entities. We still do not have any idea about the actors involved in the process and the interaction between the actors of both units. Moreover, the empirical evidence is not clear-cut. Thus, the aim of this paper is to deal in depth with the HRM practices’ transfer process in Merger and acquisition. We first focus on the literature review on the knowledge transfer process in Mergers and Acquisition then on the HRM practices’ transfer process in Multinationals. Thereafter, we compare the two literatures, and highlight the similarities and differences of the factors influencing the transfer process and the role played by the actors in the re-contextualization and re-use of selected practices. We rely on this comparison to formulate research proposals that aim to examine the determinants of HRM practices’ transfer process in mergers and acquisitions. These proposals will be used in the future for an empirical study.

"EXPLORING CROSS-CULTURAL ADJUSTMENT AND MOTIVATION OF EXPATRIATES IN THE EUROPEAN PARLIAMENT"

Zacharaki, Eleni1; Giannacourou, Maria2

1European Parliament, Brussels
2School of Social Sciences, Hellenic Open University, Greece

ABSTRACT
Throughout the past decade, there has been a growing body of literature about persons that were not sent abroad by a parent company but who individually chose to expatriate. The Self-Initiated Expatriates (SIEs) constitute a much bigger and therefore more influential group than Assigned Expatriates (AEs), (Carr et al, 2005). However, they still remain “an almost hidden aspect of the international labour market” (Jokinen et al, 2008), increasing pressure for HRM to recognize the emerging reality and implement suitable practices to ensure employees' performance at expected standards. Most studies that focus on expatriate assignments compare differences of AEs and SIEs based on individual backgrounds, task related variables and lifestyle. However, there is evidence suggesting that such broad categorization of expatriates is simplified since, especially within the SIE category, there exists a number of subgroupings with different characteristics (Suutary and Brewster, 2000). Thus, among SIEs literature, research focuses mainly on multinational companies leaving other subcategories, such as those working within international organizations such as the European Institutions, un-researched, (Dabic, et al, 2013).

PURPOSE
The objective of this exploratory study is to present new information, based on empirical research, on this largely unstudied subgroup by examining what influences the decisions of European citizens coming from 28 different Member-States, to expatriate from their country of origin and come to work in the European Parliament as well as their cross-cultural adjustment. A deeper understanding of the motivational factors to expatriate as well as of work and social adjustment may have useful implications for effective cross cultural human resources management.

DESIGN/METHODOLOGY/ APPROACH
This exploratory study is a web based survey among European Parliament employees. The online survey was considered suited since employees are located in three places: Brussels, Strasbourg and Luxembourg. Participants, selected to cover a wide range of nationalities, were informed for the link
by email. The research instrument, a three-parted structured questionnaire in English, included thirty-five (35) questions. The first part explored demographic information including how long employees had worked in the European Parliament and their intended length of stay. The second part explored motivation using a Likert type scale and it was based on a selection of factors presented in the literature, particularly on Doherty et al. 2011. The third part, explored cross-cultural adjustment of participants (general, interaction, and work adjustment using Black and Stephens’s scale, (1989).

FINDINGS

In this study, the preliminary results are presented based on a limited sample of 43 returned questionnaires (from 13 nationalities) out of the 57 which were initially sent out. The analysis presents some indications concerning self-initiated motivation and adjustment, some of which exhibit similarities with findings from other studies on this group, while others challenge existing research. Thus, regarding motivational factors, it seems that SIEs in the European Parliament were mostly motivated by their "interest to the specific job offer", "potential for skills development" as well as "professional challenge". This shows that the employees are motivated to work and learn, since they like their job and want to develop their skills, encompassing thus, the cosmopolitan focus of viewing this experience as an opportunity for personal development (Inkson and Myers 2003; Mayrhofer, et al. 2008) that distinguishes SIEs from AEs, but also exhibiting traits of self-directed career management (Doherty et al. 2011). In addition, slight differences were noticed in the prioritization of motivational factors among men and women. Men rated "personal development" as most important motivational factor whereas women rated "the specific job they were offered". This could imply that women were more interested in the job itself, pointing to limited career possibilities at home, whereas for men maybe the job was just an "instrument" in order to achieve "personal development".

These findings are also comparable with research results by Petrokopi and Froese, (2009) supporting the idea that SIEs “tend to perceive their overseas experience as a means of self-development or part of some personal agenda.” Doherty et al (2011) also found that expatriates are often motivated “by the desire for adventure and exploration, as they want to increase their self-knowledge and learn about the world.” Dickmann et al. (2008), believes that typical motives of the decision to expatriate are linked to the job that has been offered, the opportunity to have new experiences and the financial impact of working abroad. Additionally, Stahl and al. (2002) found that career development and job issues were the principal reasons for accepting a work abroad, whereas Tung’s findings (1998) indicated that expatriates value the opportunity to acquire new skills and experiences as motives for expatriation.
As far as cross-cultural adjustment is concerned, the analysis showed that SIEs in the European Parliament were averagely adjusted and that their interaction adjustment with host country nationals was rated low. The majority associated with expatriates from other nationalities, suggesting that nationality is not a significant factor in shaping expatriates’ task-related informal networks (Suvarierol, 2011), as well as social interactions. This is also evident in participants’ responses regarding interactions with colleagues, in which the vast majority reported getting along very good with their colleagues, which implies that the diverse cultural backgrounds are not perceived as a barrier to creating a common working culture and emphasizing career orientation and positive attitudes towards the new work role.

Increasing cross-cultural adjustment is important because it has been found to increase job satisfaction and performance, as well as to reduce the turnover of expatriates (Bhaskar-Shrinivas et al., 2005). Training and mentoring as well as providing support in non-work related issues will help organisations’ international staff be effective in a shorter period of time. More research in that area would be important for recruitment services and human resources departments suggesting different personal drivers that may have an impact on SIEs cross-cultural adjustment.

LIMITATIONS/IMPLICATIONS
The study adds to the literature on self-expatriation supplying tentative evidence on the existence of a distinct category of “officials” working in international organizations that combine characteristics of self and assigned expatriates. These “officials” being highly educated, younger and more cosmopolitan, feeling at ease to interact with expatriates from other nationalities are motivated more by career and personal aspirations than economic benefits. However, the relatively small sample raises concerns with regards to the risk of creating a generalization.

ORIGINALITY/VALUE
This study, being the first to present data about those on self-initiated foreign work experience in the European Parliament, contributes to the on-going research on self-initiated expatriates in international political institutions.
