## 1. INTRODUCTION TO 8085

INTEL 8085 is one of the most popular 8-bit microprocessor capable of addressing 64 KB of memory and its architecture is simple. The device has 40 pins, requires +5 V power supply and can operate with 3 MHz single phase clock.

## ALU (Arithmetic Logic Unit):

The 8085 A has a simple 8 -bit ALU and it works in coordination with the accumulator, temporary registers, 5 flags and arithmetic and logic circuits. ALU has the capability of performing several mathematical and logical operations. The temporary registers are used to hold the data during an arithmetic and logic operation. The result is stored in the accumulator and the flags are set or reset according to the result of the operation. The flags are affected by the arithmetic and logic operation. They are as follows:

## - Sign flag

After the execution of the arithmetic - logic operation if the bit D7 of the result is 1 , the sign flag is set. This flag is used with signed numbers. If it is 1 , it is a negative number and if it is 0 , it is a positive number.

- Zero flag

The zero flag is set if the ALU operation results in zero. This flag is modified by the result in the accumulator as well as in other registers.

- Auxillary carry flag

In an arithmetic operation when a carry is generated by digit D3 and passed on to D4, the auxillary flag is set.

- Parity flag

After arithmetic - logic operation, if the result has an even number of 1's the flag is set. If it has odd number of 1's it is reset.

- Carry flag

If an arithmetic operation results in a carry, the carry flag is set. The carry flag also serves as a borrow flag for subtraction.

## Timing and control unit

This unit synchronizes all the microprocessor operation with a clock and generates the control signals necessary for communication between the microprocessor and peripherals. The control signals RD (read) and WR (write) indicate the availability of data on the data bus.

## Instruction register and decoder

The instruction register and decoder are part of the ALU. When an instruction is fetched from memory it is loaded in the instruction register. The decoder decodes the instruction and establishes the sequence of events to follow.

## Register array

The 8085 has six general purpose registers to store 8-bit data during program execution. These registers are identified as B, C, D, E, H and L. they can be combined as $\mathrm{BC}, \mathrm{DE}$ and HL to perform 16-bit operation.

## Accumulator

Accumulator is an 8 -bit register that is part of the ALU. This register is used to store 8 -bit data and to perform arithmetic and logic operation. The result of an operation is stored in the accumulator.

## Program counter

The program counter is a 16 -bit register used to point to the memory address of the next instruction to be executed.

## Stack pointer

It is a 16-bit register which points to the memory location in $\mathrm{R} / \mathrm{W}$ memory, called the Stack.

## Communication lines

8085 microprocessor performs data transfer operations using three communication lines called buses. They are address bus, data bus and control bus.

- Address bus - it is a group of 16-bit lines generally identified as $\mathrm{A}_{0}-\mathrm{A}_{15}$. The address bus is unidirectional i.e., the bits flow in one direction from microprocessor to the peripheral devices. It is capable of addressing $2^{16}$ memory locations.
- Data bus - it is a group of 8 lines used for data flow and it is bidirectional. The data ranges from $00-\mathrm{FF}$.
- Control bus - it consist of various single lines that carry synchronizing signals. The microprocessor uses such signals for timing purpose.

## 2(A). 8 BIT DATA ADDITION

## AIM:

To add two 8 bit numbers stored at consecutive memory locations.

## ALGORITHM:

1. Initialize memory pointer to data location.
2. Get the first number from memory in accumulator.
3. Get the second number and add it to the accumulator.
4. Store the answer at another memory location.

## RESULT:

Thus the 8 bit numbers stored at $4500 \& 4501$ are added and the result stored at $4502 \&$ 4503.

## FLOW CHART:

## PROGRAM:

| 4100 |  | START | MVI | C, 00 | Clear C reg. |
| 4101 |  |  |  |  |  |
| 4102 |  |  | LXI | H, 4500 | Initialize HL reg. to 4500 |
| 4103 |  |  |  |  |  |
| 4104 |  |  |  |  |  |
| 4105 |  |  | MOV | A, M | Transfer first data to accumulator |
| 4106 |  |  | INX | H | Increment HL reg. to point next memory Location. |
| 4107 |  |  | ADD | M | Add first number to acc. Content. |
| 4108 |  |  | JNC | L1 | Jump to location if result does not yield carry. |

## 2(B). 8 BIT DATA SUBTRACTION

## AIM:

To Subtract two 8 bit numbers stored at consecutive memory locations.

## ALGORITHM:

1. Initialize memory pointer to data location.
2. Get the first number from memory in accumulator.
3. Get the second number and subtract from the accumulator.
4. If the result yields a borrow, the content of the acc. is complemented and 01 H is added to it ( 2 's complement). A register is cleared and the content of that reg. is incremented in case there is a borrow. If there is no borrow the content of the acc. is directly taken as the result.
5. Store the answer at next memory location.

## RESULT:

Thus the 8 bit numbers stored at $4500 \& 4501$ are subtracted and the result stored at 4502 \& 4503 .

## 3(A). 8 BIT DATA MULTIPLICATION

## AIM:

To multiply two 8 bit numbers stored at consecutive memory locations and store the result in memory.

## ALGORITHM:

LOGIC: Multiplication can be done by repeated addition.

1. Initialize memory pointer to data location.
2. Move multiplicand to a register.
3. Move the multiplier to another register.
4. Clear the accumulator.
5. Add multiplicand to accumulator
6. Decrement multiplier
7. Repeat step 5 till multiplier comes to zero.
8. The result, which is in the accumulator, is stored in a memory location.

## RESULT:

Thus the 8 -bit multiplication was done in $8085 \mu$ p using repeated addition method.

## FLOW CHART:

## 3(B). 8 BIT DIVISION

## AIM:

To divide two 8 -bit numbers and store the result in memory.

## ALGORITHM:

LOGIC: Division is done using the method Repeated subtraction.

1. Load Divisor and Dividend
2. Subtract divisor from dividend
3. Count the number of times of subtraction which equals the quotient
4. Stop subtraction when the dividend is less than the divisor .The dividend now becomes the remainder. Otherwise go to step 2.
5. stop the program execution.

## RESULT:

Thus an ALP was written for 8-bit division using repeated subtraction method and executed using $8085 \mu \mathrm{p}$ kits

## 4(A). 16 BIT DATA ADDITION

## AIM:

To add two 16-bit numbers stored at consecutive memory locations.

## ALGORITHM:

1. Initialize memory pointer to data location.
2. Get the first number from memory and store in Register pair.
3. Get the second number in memory and add it to the Register pair.
4. Store the sum \& carry in separate memory locations.

## RESULT:

Thus an ALP program for 16-bit addition was written and executed in $8085 \mu$ p using special instructions.

## 6(A). LARGEST ELEMENT IN AN ARRAY

## AIM:

To find the largest element in an array.

## ALGORITHM:

1. Place all the elements of an array in the consecutive memory locations.
2. Fetch the first element from the memory location and load it in the accumulator.
3. Initialize a counter (register) with the total number of elements in an array.
4. Decrement the counter by 1 .
5. Increment the memory pointer to point to the next element.
6. Compare the accumulator content with the memory content (next element).
7. If the accumulator content is smaller, then move the memory content (largest element) to the accumulator. Else continue.
8. Decrement the counter by 1 .
9. Repeat steps 5 to 8 until the counter reaches zero
10. Store the result (accumulator content) in the specified memory location.

## RESULT:

Thus the largest number in the given array is found out.

## 7(A).ASCENDING ORDER

## AIM:

To sort the given number in the ascending order using 8085 microprocessor.

## ALGORITHM:

1. Get the numbers to be sorted from the memory locations.
2. Compare the first two numbers and if the first number is larger than second then I interchange the number.
3. If the first number is smaller, go to step 4
4. Repeat steps 2 and 3 until the numbers are in required order

## RESULT:

## 8(A). CODE CONVERSION -DECIMAL TO HEX

## AIM:

To convert a given decimal number to hexadecimal.

## ALGORITHM:

1. Initialize the memory location to the data pointer.
2. Increment B register.
3. Increment accumulator by 1 and adjust it to decimal every time.
4. Compare the given decimal number with accumulator value.
5. When both matches, the equivalent hexadecimal value is in B register.
6. Store the resultant in memory location.

## RESULT:

Thus an ALP program for conversion of decimal to hexadecimal was written and executed.

## 9(A) BCD ADDITION

## AIM:

To add two 8 bit BCD numbers stored at consecutive memory locations.

## ALGORITHM:

1. Initialize memory pointer to data location.
2. Get the first number from memory in accumulator.
3. Get the second number and add it to the accumulator
4. Adjust the accumulator value to the proper BCD value using DAA instruction.
5. Store the answer at another memory location.

## RESULT:

Thus the 8 bit BCD numbers stored at $4500 \& 4501$ are added and the result stored at $4502 \& 4503$.

## 9(B). BCD SUBTRACTION

## AIM:

To Subtract two 8 bit BCD numbers stored at consecutive memory locations.

## ALGORITHM:

1. Load the minuend and subtrahend in two registers.
2. Initialize Borrow register to 0 .
3. Take the 100 's complement of the subtrahend.
4. Add the result with the minuend which yields the result.
5. Adjust the accumulator value to the proper BCD value using DAA instruction. If there is a carry ignore it.
6. If there is no carry, increment the carry register by 1
7. Store the content of the accumulator (result)and borrow register in the specified memory location

## RESULT:

Thus the 8 bit BCD numbers stored at $4500 \& 4501$ are subtracted and the result stored at $4502 \& 4503$.

## 10. $2 \times 2$ MATRIX MULTIPLICATION

## AIM:

To perform the $2 \times 2$ matrix multiplication.

## ALGORITHM:

1. Load the 2 input matrices in the separate address and initialize the HL and the DE register pair with the starting address respectively.
2. Call a subroutine for performing the multiplication of one element of a matrix with the other element of the other matrix.
3. Call a subroutine to store the resultant values in a separate matrix.

## RESULT:

Thus the $2 \times 2$ matrix multiplication is performed and the result is stored at 4700,4701, $4702 \& 4703$.

### 11.8086 STRING MANIPULATION - SEARCH A WORD

## AIM:

To search a word from a string.

## ALGORITHM:

1. Load the source and destination index register with starting and the ending address respectively.
2. Initialize the counter with the total number of words to be copied.
3. Clear the direction flag for auto incrementing mode of transfer.
4. Use the string manipulation instruction SCASW with the prefix REP to search a word from string.
5. If a match is found ( $\mathrm{z}=1$ ), display 01 in destination address. Otherwise, display 00 in destination address.

## RESULT:

A word is searched and the count of number of appearances is displayed.

## PROGRAM:

### 12.8086 STRING MANIPULATION -FIND AND REPLACE A WORD

## AIM:

To find and replace a word from a string.

## ALGORITHM:

1. Load the source and destination index register with starting and the ending address respectively.
2. Initialize the counter with the total number of words to be copied.
3. Clear the direction flag for auto incrementing mode of transfer.
4. Use the string manipulation instruction SCASW with the prefix REP to search a word from string.
5. If a match is found $(\mathrm{z}=1)$, replace the old word with the current word in destination address. Otherwise, stop.

## RESULT:

A word is found and replaced from a string.

## 13. 8086 STRING MANIPULATION - COPY A STRING

AIM:
To copy a string of data words from one location to the other.

## ALGORITHM:

6. Load the source and destination index register with starting and the ending address respectively.
7. Initialize the counter with the total number of words to be copied.
8. Clear the direction flag for auto incrementing mode of transfer.
9. Use the string manipulation instruction MOVSW with the prefix REP to copy a string from source to destination.

## RESULT:

A string of data words is copied from one location to other.

### 14.8086 STRING MANIPULATION - SORTING

## AIM:

To sort a group of data bytes.

## ALGORITHM:

- Place all the elements of an array named list (in the consecutive memory locations).
- Initialize two counters DX \& CX with the total number of elements in the array.
- Do the following steps until the counter B reaches 0 .
- Load the first element in the accumulator
- Do the following steps until the counter C reaches 0 .

1. Compare the accumulator content with the next element present in the next memory location. If the accumulator content is smaller go to next step; otherwise, swap the content of accumulator with the content of memory location.
2. Increment the memory pointer to point to the next element.
3. Decrement the counter C by 1 .

- Stop the execution.

## RESULT:

A group of data bytes are arranged in ascending order.
