

# **2016 NFL Draft Class Slaytics Evaluation**

**Created by Ethan Young**

## What are Slaytics?

Slaytics are analytic composites designed to quantify a NFL prospects measurables. This started with SPARQ. While the original SPARQ formula has never been released, I was able to recreate something very close to it through a series of regression models. Then, I changed the equation to use drills performed at the NFL Combine, instead of inputs like the Kneeling Power Ball Toss and the Beep Test. The total list of inputs are the 40 Yard Dash, 10 Yard Split, Bench Press, Short Shuttle, 3-Cone, Vertical Jump, and Broad Jump. I've always loved SPARQ, but felt like something was missing. And that is how I came up with tFREAK.

While SPARQ takes many factors into account, it doesn't measure any size or length measurables other than weight. Size and length are obviously important for football players, and yet they are ignored in SPARQ. Take DeForest Buckner for example. Just by looking at him, you can tell he is a freak. But he only tested in the 55th percentile for SPARQ score among defensive lineman, so clearly there is a disconnect somewhere. Players like Buckner are why I created True FREAK Rating (or tFREAK for short), aptly named to capture the "freaky" players that SPARQ misses. Think of it as SPARQ for size and length rather than athleticism. It takes height, weight, arm length, and hand size into account to develop a size and length composite score. Anyway, back to Buckner. He ranks in the 94th percentile of tFREAK among defensive linemen since 1999, which really paints a better picture of his traits. That is just a quick example of how tFREAK effectively captures the subset of lengthy players SPARQ can miss on. The NFL covets length, and we can't ignore it in our analysis. But like SPARQ, while tFREAK is helpful on it's own, it doesn't fully capture all the measurables. So that's why I made a third formula, combining SPARQ and tFREAK.

I named this third formula Size, Length and Athleticism score, or SLA score for short. This all-encompassing composite seeks to solve the issues with tFREAK and SPARQ by bringing them together. SPARQ tends to rate small explosive players very highly, and tFREAK rates long, lumbering players higher than we want. SLA on the other hand, gives us the players with the most desirable measurable sets. And while it's not perfect, I think these size, length, and athleticism analytics (I call the whole data set Slaytics) are the best way to quantify a football player's measurables.

## **How should Slaytics be used?**

Ideally, Slaytics should be implemented as part of the player evaluation process. They currently serve four main functions in this process:

- 1. Identifying Red Flags:** Players with a very low success rate based on their measurables and past data (“Red” Players under PST).
- 2. Identifying Potential:** Quantifying “ceiling”, and showcasing which players have tools in line with elite players (“Blue” Players over TLP).
- 3. Comparing Players:** Looking at Slaytic splits to identify how closely related players measurable sets are.
- 4. Deciding between Players in Same Tier:** When looking at players with similar grades, the one with better measurables often has more success.

Slaytics can be very effective when implemented in draft strategy, but they are not a big board and should be judged as such. Obviously factors like film, production, age, injury history, behavior, and scheme fit all play a role in the evaluation process. Slaytics serve as another filter to tell us how a prospect stacks up compared to past data.

## **Results Summary**

- First, I take the scores for each prospect and rank them by positional SLA percentiles (Pages 1-38).
- Next, I apply my Positional Slaytic Thresholds to each group. These thresholds can use SPARQ, tFREAK, SLA scores, and even raw drill results. Each position has different thresholds. Blue players are above the upper bound (elite level, called Top Level Players), green players are in suitable range, and red players are below the lower bound. If a player isn't listed here, that means either a threshold doesn't exist at that position, or it is someone I don't have data on (Pages 39-42).
- Then I use the Return on Draft Capital Chart to measure the effectiveness of the thresholds (Pages 43-48).
- After that, I look at this year's prospects, and whether they hit the PST or TLP requirements. (Pages 49-53).
  - Finally, I close by analyzing all this data.

**To simplify this, we are quantifying each prospects measurables, identifying which prospects have a very low or very high chance of success based on these measurables and past data, and then proving that past data right with RODC values.**

## Return on Draft Capital

RODC starts with Approximate Value. AV is a universal and unbiased way to quantify the impact of players. I use it to examine players in relation to the PST's. If you want to learn more about AV, check out Pro Football Reference. I divide WAV (weighted AV) by career length to level out the playing field, since we don't want career length to effect these values. Averaging WAV per year also allows us to accurately quantify younger players earlier on in their career.

RODC serves as a way to measure a player's value relative to where he was picked. By subtracting a player's expected WAVPY (based on the average return of where they were drafted) from their actual WAVPY, you get a quantifiable return on draft capital. So if you are the 13th pick, you should be near the 13th best WAVPY of an average class, not the average of the 13th pick. In the case of David Carr, the equation looks like:

$$4.00 \text{ (Actual WAVPY)} - 11.09 \text{ (Expected WAVPY for the 1st Pick)} = -7.09 \text{ (Return on Draft Capital)}$$

RODC scores between -0.5 and 0.5 are near an acceptable return. Scores over and under that are where you can start calling players good or bad picks. Some positions have different expected WAV scales, to account for AV devaluing certain positions.

RODC is meant to look at players on a macro scale, rather than nailing each individual player exactly. It provides a very good, although not perfect, view of if a player was worth being selected where he was. We can use these values to evaluate the effectiveness of thresholds like PST and TLP.

## Success Rate Summary

Success Rates	TLP	Impact Rating	Under PST	Impact Rating
QB	N/A	N/A	2.8%	3.89
RB	77.8%	6.61	N/A	N/A
WR	75.0%	8.92	3.4%	2.00
TE	50.0%	6.88	4.7%	3.10
OT	61.0%	7.26	7.7%	4.89
OG	64.7%	6.21	5.8%	4.50
DL	60.0%	10.84	4.6%	4.31
EDGE	80.0%	7.93	5.3%	3.85
LB	40.0%	7.38	12.1%	5.58
CB	56.8%	6.68	10.1%	4.18
S	50.0%	5.23	7.8%	2.75

Here are the success rates of TLP and PST for each position. Remember, we define success as having a positive Return on Draft Capital. Some positions like Fullback, Center, and Nose Tackle aren't included, due to a lack of effective thresholds. Impact Rating is simply taking the average WAVPY of the players with a positive RODC at each position, so higher numbers are better.

Lower bounds don't exist at RB, and upper bounds don't exist at QB, as you can see here.

LB is by far the least effective of the included positions, due to the instinctual nature of the position. But these markers still provides a lot of value. Take a look at the full TLP list below, and you'll see many of the best linebackers in the league on the list. And while there is a lot clutter there as well, that is where things like tape evaluation are crucial to determine which players to target.

TE has a very small sample, but Jimmy Graham, Rob Gronkowski, Greg Olsen lead the pack. Two of the "failures" were Vernon Davis and Kellen Winslow, due to being drafted so highly. I expect that success rate to jump as more TE's come in the league. The others are more stable.

## QB Results

## **Analysis:**

As you can see, there are a lot of notable prospects that fall in the red category this year. Keep in mind, just based on the number of “Red” players, one or two of these players will likely end up with a positive RODC, and be deemed a success. But as the data shows us, the ceiling on these players is not high, and by not drafting these players over a long period of time, we can avoid wasting assets on players with such slim chances of success.

My very, very, generalized advice to NFL teams would be to make selecting “Blue” and high end “Green” prospects (that do well in other areas of the evaluation process) a priority. I would also recommend avoiding “Red” prospects as a whole. With each team only seven (or maybe a couple more) picks in the draft, there should be enough guys in even a bad draft class that you won’t be forced into taking anyone on the red side. If you do have to acquire one though, don’t do so in the third round, as it has historically been inefficient.

<b>Average "Red" RODC By Round</b>	
<b>1st</b>	<b>-3.11</b>
<b>2nd</b>	<b>-1.48</b>
<b>3rd</b>	<b>-1.60</b>
<b>4th</b>	<b>-1.44</b>
<b>5th</b>	<b>-0.88</b>
<b>6th</b>	<b>-0.62</b>
<b>7th</b>	<b>-0.24</b>

Instead of getting closer to zero like every other descending round, the 3rd Round is actually got further away than the 2nd!

Stockpiling TLPs is the best way to get a positive Return on Draft Value, so being aggressive about acquiring as many as possible is not a bad thing.

Please don't assume all "Greens" or "Reds" are the same. There can be a huge difference between a high and low end "Green". Take a look at the actual splits when comparing players.

Of the fifteen "Blue" TLP's in this class, eight are defensive backs. It's slightly easier for DBs to end up there, but controlling more than half of the TLP list is still impressive nonetheless. It's a great year to grab a DB late in the draft.

Laquon Treadwell, Hunter Henry, A'Shawn Robinson, Adolphus Washington, Kalamei Correa, Su'a Cravens, and Mackensie Alexander are some notable players I wouldn't be comfortable taking, especially where they currently being projected.

Ultimately, the best purpose of this data is to help make informed draft decisions. And when used in conjunction with other evaluation processes, it can do just that. By letting the data tell us which prospects don't have the tools to succeed and who does have the measurables to hang with elite positional counterparts, we can reduce misses and give ourselves a much better chance at drafting efficiently.
