

## MICROCURRENT

For decades Microcurrent has been used in the medical field to accelerate healing of bone and muscle tissue, increasing protein syntheses, and the production of ATP (adenosine triphosphate), known as the energy molecule that assists in cell turnover. This safe non-invasive technology is also, used for aesthetic purposes, to firm, tone and lifts the muscles in both the face and body, creating a younger, vital appearance.

Microcurrent Facial and Body Sculpting unique technology is an innovative approach to taking years off your appearance. It is a painless way to gently tighten, firm, and re-educate muscle tissue using small “micro” electrical impulses.

Microcurrent Facial Sculpting, also known as [“The Lunchtime Lift.”](#)

**How is the procedure done? How does it feel?** Specially formulated skin products are first applied over the targeted areas of the face or body. The procedure is performed through exclusively designed conducting wands which emit Microcurrents. The current penetrates through the layers of skin through specific acupuncture points, thus causing increased production of collagen and elastin. The experience is so wonderfully relaxing and euphoric that you may find yourself drifting off to sleep.

**What results can I expect and how long will it last?** The technology is so effective, that everyone will get age-defying results. Expect to achieve approximately 30% improvement in the tone, texture, and firmness of treated area. When performed on the face, fine lines are softened, jowls are firmed and wrinkles are reduced. You will achieve overall improved skin quality and natural youthful appearance with a series of treatments.

These treatments are not limited to women, more and more men are opting for this painless non-invasive approach to firmer, younger looking skin!
