

Open positions for MSc/PhD students

For a new soil-water-plant lab at the Hebrew University, The Department of Soil and Water Sciences (Rehovot Campus)

In our lab, we deal with the interactions between roots and soil. Our primary objective is to understand how small-scale processes at the soil-root interface affect water dynamics and root water uptake. To meet our goals we use state of the art experiments and modeling. We are also interested in the development of non-invasive methods to image the soil-root system.

We are looking for independent and highly motivated students with a background in natural sciences or engineering to join our lab.

For more details, please contact me.
