

HOMOTOXICOLOGY

SIMPLIFIED CHART

	ELIMINATION	INFLAMMATION	DEPOSITION
WHAT'S HAPPENING	The body removes waste that doesn't belong. This is a natural healthy response. The body uses the 7 channels of elimination for this duty which is the blood, liver, kidney, lungs, lymphatic system, colon, and skin.	The body creates inflammation to heal the area. Inflammation is always the marker that shows something is wrong in that area, and the immune system is at work. Inflammation works to eliminate waste products.	This is when the body cannot eliminate the waste properly due to blockages. The body will place the waste product deeper into the tissue to deal with the issue. The body at this point isn't working at 100%. A secondary system will have to make up for the elimination and healing.
SYMPTOMS	Coughing, sweating, pimples, gas, diarrhea, vomiting, sniffles, urinating, heartburn, mucus.	Fever, yeast, headaches, swelling, edema, infection, bronchitis, tonsillitis, cellulitis.	Fever, yeast, headaches, swelling, edema, infection, bronchitis, tonsillitis, cellulitis.
STATE WHAT TO DO	HEALTHY Just provide comfort for the body.	SELF RESOLVING ILLNESS Just observe, the body is in the act of healing. React according.	SERIOUS ILLNESS Feed the body raw material so it can heal itself.

After this point the body is becoming more weaker and weaker and you will go into a chronic state. The body will try to handle the issue, but most likely something and someone will have to come in to assist it. Some may be on medication at this point, but this will only shut down the body ability to heal, meaning the waste product will only go deeper into the tissues. Also medication brings its own problems because it is as well a poison (direct effects)

	IMPREGNATION	DEGENERATION	DEDIFFERENTIATION
WHAT'S HAPPENING	Chronic disease takes place in this phase. The insult where the deposition stage happen is imprinted into the tissues. All secondary systems must take place due to the first systems no longer being efficient. Little to no elimination is taking place. The tissues will try to adapt for elimination though which is the chronic problems being experience by the sufferer. For a example inflammation.	The cells in the tissue are starting to break down. The body recognizes this break down, and starts to get rid of the cells that can no longer do their duty. This is where you may see organ failure due to the body not being able to make new healthy cells.	This is the final stage. The body is at it's weakest point, and the healing efforts has begun to stop due to the body losing the battle of constant insult of being poison. The dying tissues are being prepare to be decompose. This is where cancer develops. Fortunately for most people this takes years to develop.
SYMPTOMS	Allergies, rheumatoid arthritis, fibromyalgia, kidney failure, crohn's, migraine, hyperthyroid, eczema.	Diabetes, heart attack, AIDS, gum disease, anemia, Parkinson's, epilepsy.	Any cancer may develop at this point.
STATE WHAT TO DO	CHRONIC PROBLEMS Raw material needs to be given. Give the system an assist by detoxing, and opening up the blockages (any scar tissue or restrictions of the tissue)	SYSTEM FAILURES Cellular detoxification is a must in this phase. Antioxidant therapy should be provided to increase electrons, and to neutralize free radicals. Raw material should be given (nutrients). Drink structure water and local fresh vegetable juices.	TISSUES & ORGAN DEATH Control ph levels and increase oxygen levels is a must in this phase. Also having a healthy mindset is crucial. So get out and enjoy yourself. Eat only local foods and drink structure water along with fresh vegetable juices. Go outside in the sun to increase Vitamin D production. Cancer is tough to deal with because the body believes its time to recycle but with the right treatment it can be resolve. Detoxification support and antioxidant therapy should be added once you deal with the other what to do list given.
