

КАТАЛОГ СТАНДАРТНИ ПРОФИЛИ

Алуминият е най-изобилният метал в земната кора.
Изключително лек като метал, с тегло от 2,7 kg/dm³.
Алуминият притежава добра устойчивост на натиск.
Чрез използването на екструдирани профили, с подходящи сплави и с правилен напречен разрез може да се постигне якост, сравнима с тази на стоманени структури. Алуминият е подходящ за формоване, машинна обработка, за свързване чрез заваряване, спояване, залепване и занитване. Устойчив на корозия, отличен проводник, нетоксичен, притежаващ добри светлоотразителни свойства.
Алуминият е материал, който дава неограничена възможност за дизайн на различна форма на профилите.
Максималните размери на профилите варират в зависимост от алуминиевата сплав, дебелина на стената, сложността на профилите и толерансите.

Алуминиеви сплави

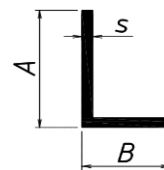

Сплавите от 6000-та серия имат добри свойства за екструзия и могат да се подлагат на последваща топлинна обработка (стареене).
